The following charges for admission to the Show include free transportation between the two buildings:

Saturdays. November 6th and 13th, 2s. 6d. Second half of ticket may be used on the same day or the following Saturday.

Thursday, November 11th, 10s. Second half of ticket may be used on the same day or any other day.

Other days, 5s. Second half of ticket may be used on the same day or any other day but Thursday.

The Wood Lane entrance of the White City will be used.

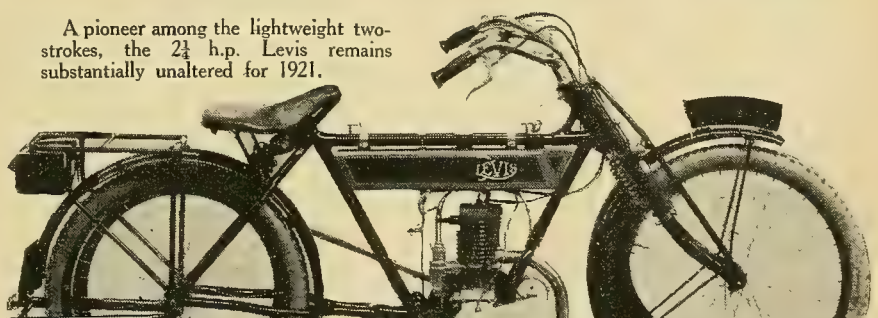
A comprehensive forecast and guide will be published in to-morrow's issue of *The Autocar*, which should be read by all intending visitors.

A Three-speed 2½ h.p. T.T. Levis.

A Road Edition of the I. O. M. Machine to be marketed in Addition to Three 2¼ h.p. Models.

HITHERTO the Levis has appealed mainly to the novice and the weaker sex; and, although an extraordinarily capable little machine, its 211 c.c. engine and single gear do not make up the specification of a "road-eater's" mount. But the 2½ h.p. model (67×70 mm. bore and stroke = 247 c.c.), which, amongst other things, gained *The Motor Cycle* Cup in this year's T.T., is a different proposition; and all who love the light, fast, go-anywhere type will welcome the news that for 1921 Messrs. Butterfields, Ltd., of Stechford, Birmingham, are marketing what is practically a replica of R. O. Clark's Isle of Man model.

Ultimately the T.T. Levis will have a three-speed gear box and clutch (of Levis manufacture and design), and it is hoped to show one so fitted at Olympia. At present, however, the gear is in an experimental stage, and, although the same type of box, minus clutch, emerged with honours from the 250 miles gruelling in the Isle of Man, we were told that it will not be adopted as standard until it passes exhaustive road tests. Chain and belt transmission is used, and the drive



A pioneer among the lightweight two-strokes, the 2¼ h.p. Levis remains substantially unaltered for 1921.

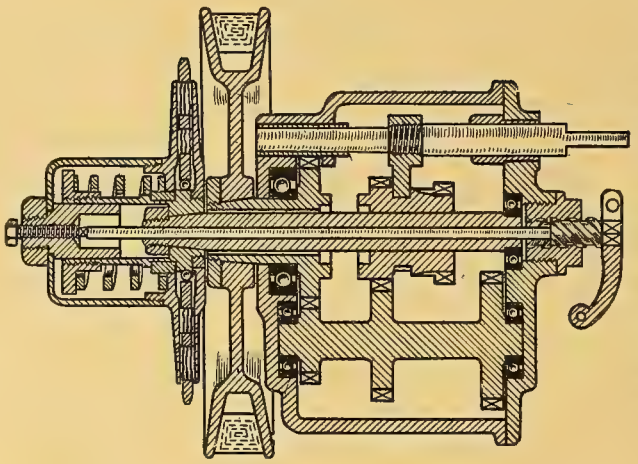
is direct on top, while first and second speeds are obtained by sliding pinions on a square mainshaft. The design and internal workmanship appear to be exemplary, while the weight, including a handle-bar-operated cork inset clutch, is but 9 lb. 2 oz. The provisional prices are £68 single geared, and £83 with three-speed gear box and clutch.

Touring, sports, and ladies' models of the 2¼ h.p. machine will be marketed next year. The former two differ only in detail, *i.e.*, handle-bars and gearing; while an exceptionally low frame allows

A Three-speed T.T. Levis for 1921.—an admirable adaptation for feminine use by simply adding a belt guard. The price of the 211 c.c. machine remains at £60; and the specification now includes an E.I.C. magneto, and a B. and B., Senspray, or special two-stroke Amac carburetter.

More than interesting evidence that the standard Levis, as supplied to the public, is a genuine lightweight, is forthcoming in the fact that, when the railways refused to carry machines that were over 112 lb. by passenger train, Messrs. Butterfields continually despatched their products so, and only rarely found it necessary to send on the tool-kit under separate cover.

Although the larger T.T. Levis is indisputably capable of pulling a sidecar, the makers do not recommend this, and refuse to spoil a real solo machine by adding weight.



The addition of a cork inset clutch makes the new Levis three-speed gear box ideal for road work on a light machine. Of course, wider ratios are used than those which were employed on the gears fitted to the T.T. machines in the Isle of Man. The weight complete, with all the operating mechanism, is under 10 lb.

CLUB NEWS. (Continued from page 531.)

Keighley M.C.

The results, on handicap, of the speed trial held on October 24th, are as follows: 1, R. Holmes (5-6 Ariel sc.); 2, A. Thornton (2¾ Douglas); 3, N. Ryecroft (2¾ O.K. Junior).

Leeds and District M.C.

Some fast times were made at the speed trials on October 31st, as the following results show: 1st (Owen Brooks Cup and gold medal), R. A. Bonner (8 Jap), 67.1 m.p.h.; 2, R. J. Brown (7-9 Indian), 66.6 m.p.h.; 3, L. A. Chappell (4 Triumph), 63.4 m.p.h.

Surbiton and District M.C.C.

In the trial for the Ballard Cup last Saturday only fifteen competitors out of an entry of sixty made non-stop runs. V. Ollson (7-9 Indian) wins the Ballard cup: while the other awards are as follows:

ZENITH GOLD MEDAL.—C. Cressthwaite (5-6 James sc.).

ZENITH SILVER MEDAL.—W. B. Reeves (8 Zenith sc.).

HASLAM PRIZE for Machines under 350 c.c.—R. B. Clark (2¾ Coulson B).

BRONZE MEDALS.—W. J. Kelly (8 Zenith) and R. A. Green (4 Triumph).

G. Offord (8 G.N.) was the only driver of light car to make a non-stop run.

Mansfield and District M.C. and L.C.C.

Clipston Drive was in magnificent condition for the speed trials of this club on Saturday, and everything went off without a hitch. Fastest time of the day was made by E. Chandler, on his locally built 7-9 D.M.C. The complete results are as follows:

CLASS 1 (275 c.c.).—1, gold medal, A. Hemstock (2½ Villiers), 37½s.; 2, silver medals, E. Shaw (2½ Villiers), 42⅗s., and S. Marshall (2½ Triumph), 43⅕s.

CLASS 2 (375 c.c.).—1, gold medal, J. R. Taft (2¾ Douglas), 35s.; 2, silver medal, W. Speed (2¾ Douglas), 35⅕s.; 3, silver meda), H. Hayes (2¾ Douglas), 38⅘s.

CLASS 3 (500 c.c.).—1, gold medal, S. Laurence (3½ Norton), 27⅗s.; 2, silver medal, K. S. Topping (3½ Norton), 28s.; 3, silver medal, J. E. Amery (3 A.B.C.), 29s.

CLASS 4 (750 c.c.).—1, gold medal, S. Laurence (3½ Norton), 27½s.; 2, silver medal, G. Mills (5 o.h.v. Jap), 28s.; 3, silver medal, K. S. Topping (3½ Norton), 28s.

CLASS 5 (Unlimited, solo).—1, gold medal, E. Chandler (7-9 D.M.C.), 26½s.; 2, silver medal, G. Mills (5 Jap), 27s.; 3, silver medal, S. Laurence (3½ Norton), 27⅞s.

CLASS 6 (Unlimited sidecar).—1, gold medal, S. Laurence (3½ Norton sc.), 29⅘s.; 2, silver medal, K. S. Topping (3½ Norton), 32⅘s.

Bradford M.C. and L.C.C.

A well attended meeting of the above club took place on Thursday night, October 28th, at the club headquarters, when twenty-nine new members were elected, making the club now over 300 strong.

The annual dinner was definitely arranged to take place on December 19th, and a one day trial was arranged for December 12th. Mr. Frank Spencer kindly offered a trophy to be won outright.

After the meeting Mr. R. W. Stanfield, of the Scott staff, gave a most excellent and instructive lecture on magnetos and dynamos.

Stalybridge and District M.C.

A strong head wind prevented exceptionally fast times at the hill-climb on Saturday. The event was well attended; and the provisional results are as follows:

CLASS 1 (350 c.c., so.o).—J. Hamer (2¾ Allon), 1m. 40½s.; G. H. Shaw (2¾ Douglas), 2m. 7s.

CLASS 2 (500 c.c., solo).—H. Smethurst (3½ Norton), 1m. 6⅘s.; H. Mills (3½ Bradbury), 1m. 10s.; T. Moorhouse (3½ Triumph), 1m. 18⅘s.

CLASS 3 (750 c.c., solo).—H. Smethurst (3½ Norton), 1m. 5s.; A. Margrave (4 Triumph), 1m. 8s.; W. Hoyle and E. V. Lees (4 Triumph), 1m. 16s., tied.

CLASS 4 (Unlimited c.c., solo).—E. Bottomley (7-9 Harley), 56½; H. Smethurst (3½ Norton) and A. Margrave (4 Triumph), 1m. 5s., tied.

CLASS 5 (Sidecars, 750 c.c.).—O. E. Carter (3½ O.C.-J.A.P.sc.), 1m. 20s.; H. Smethurst (3½ Norton, sc.), 1m. 27s.; R. R. Allison (4 Douglas) and H. Mills (4 Norton, sc.), 1m. 57s., tied.

CLASS 6 (Sidecars, unlimited c.c.).—E. Bottomley (7-9 Harley sc.), 1m. 9s.; O. E. Carter (3½ O.C.-J.A.P. sc.), 1m. 20s.; H. Smethurst (3½ Norton, s c.), 1m. 27s.

FASTEST TIME OF DAY.—E. Bottomley (7-9 Harley), 56½s.

FASTEST TWO-STROKE.—J. W. Hamer (2¾ Allon), 1m. 40½s.

Newcastle and District M.C.

Over 150 members and friends of Newcastle and District M.C. attended the annual dinner at the County Hotel, Newcastle, on 27th October, and spent an enjoyable evening. Mr. Fred Keir, the club's chairman, read letters of apology from the Lord Mayor-elect, Councillor T. W. Rowe, and from Mr. Q. A. Nicol, O.B.E., the organising secretary of the N.E.A.A. He was supported by Sir Arthur Sutherland, Councillor James Cooper (the oldest member), Messrs. Lindon Travers, Robson Crozier, five successful Six Days Trial members, and one T.T. member.

Sir Arthur Sutherland was flanked by an imposing array of prizes, the club's awards being worth over £130, in addition to numerous valuable trophies from the trade and private members.

In offering the toast of "Our Guests," the Chairman recalled the fact that the club had the mournful satisfaction of providing, in the person of Mr. Jacob Garson, late of Northumberland Hussars, the first despatch rider to fall in the great war. They still kept his memory green.

Three Shires Centre A.C.U.

The first board meeting of the above centre was held at the Plough Hotel, Cheltenham, on October 21st, delegates from the following clubs being present: Cheltenham, Stroud, Stourbridge, Hereford, Malvern, and Worcester Motor Cycle Clubs. It was agreed it was not possible to define the area, as self-determination on the part of any clubs should rule as to which centre the clubs should join. The above clubs having shown their intention to join the centre were, of course, accepted without opposition. It was suggested that the centre should be renamed, and after various suggestions it was decided to call it "The Western Centre." The meeting then proceeded to the election of officers, the undermentioned being appointed: Chairman, Mr. Hathaway (A.C.U. Consul), Cheltenham; vice-chairman, Mr. Williams, Cheltenham; vice-chairman, Mr. Barnes, Stourbridge; secretary, Mr. Howell, Worcester; treasurer, Mr. Featherstone, Cheltenham; delegate to A.C.U. Committee, Mr. Goddard, Stroud; trials secretary, Mr. Newman, Worcester; record secretary, Mr. Paynter, Cheltenham; publicity secretary, Mr. MacVitie, Worcester.

It was hoped that the Dutch Trials would be held in this district, and a discussion took place as to entertaining our Dutch friends in this country. It was decided that this matter should be again brought up at the next meeting to be held at Worcester on November 25th.

It was decided to hold an inaugural club team trial, starting at a point near Stroud, on November 6th, for which a handsome challenge trophy should be awarded, the trials secretary to organise the trial.

Here are definite proofs

of the supremacy of the 2¼ h.p. Royal Enfield Two-stroke Lightweight Motor Cycle. The specification of this popular lightweight is unique in its completeness and the performances set forth below are indicative of its outstanding superiority

A.C.U. Six Days Trials, 1920.

Don't fail to visit our Stand at the Exhibition—
STAND 72.

The famous Blackburne — the most successful Motor Cycle in this year's trials and races— will be the talk of the Show.

The best is cheapest in the long run. When you choose your 1921 Motor Cycle, buy the best— the Blackburne—or insist on your machine being fitted wiih a

Blackburne ENGINE.

Burney & Blackburne, Limited, 38, Conduit Street, London, W.1.
Telephone: Mayfair 637.

Made in four sizes—3in., 4in., 6in. and 9in. Remember that every genuine "King Dick" Spanner bearing mark shown is guaranteed for ever

Obtainable of all good dealers.

Abingdon Works, Ltd., Tyseley. Birmingham.
LONDON:—G. H. SMITH, 12, Mortimer Street, W.1.
IRELAND:—F. N. DRAPER, 68, Middle Abbey St., Dublin.

Proof!

The following letter bears out our statement that the "King Dick" Spanner will adjust a watch or a motor car.

India August 14th, 1920

"Having occasion to use a very ancient watch which had not been wound for six or seven years, I was baulked by having no watch key. However, recalling your advertisement, I tried winding and setting the watch with my 'Baby King Dick.'

I was not only completely successful, but have not bothered to buy a watch key, and now use the spanner to wind my watch every day, and this in spite of the fact that I have frequently grossly maltreated this excellent little spanner by using it on quite large nuts on my motor cycle.

(Signed) J.C., Captain I.A.

SATISFACTION.

"Hoskison" and "Satisfaction" are Inseparable

If you would like to know more about "Hoskison" Motor Cycles—the reason for the unvarying SATISFACTION that they give on the road—**have a chat with your Dealer, OR, BETTER STILL, COME AND SEE US ON** → **STAND No. 51, OLYMPIA**

Walthamstow, 20-10-20

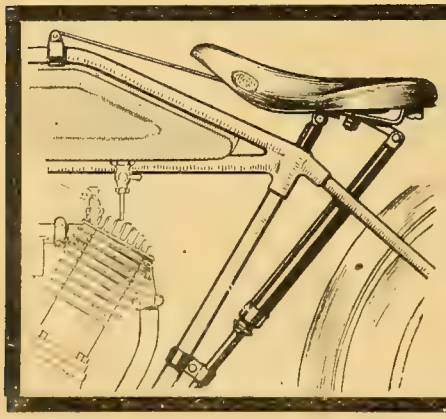
Dear Sirs,

Having used the 2¾ h.p. machine you supplied me with last July, all through the summer, I wish to let you know that I am thoroughly satisfied with it. I have done quite a lot of riding, and have had no trouble whatsoever; in short, it comes up to all my expectations of what a really good machine should be.

Your dealings with me have, from the first, been most prompt and businesslike

Yours faithfully,
E.C.

Messrs. The Hoskison Motors, Ltd.



AN INVENTION OF PROVED MERIT.

THE PATENT L.M.C. SUSPENSION

This saddle suspension (Patent No. 150158) has now been fully proved to be by far the most efficient device of its kind yet invented. It gives perfect insulation rom the worst shocks, and renders a rigid-framed machine virtually equal to a spring-framed one. It is now being marketed separately for fitting to other machines than the L.M.C., at a (provisional) price of £6 6 0, and can be fitted to practically any machine which has a top tube over the tank.

The Lloyd Motor Engineering Co., Ltd., 132, Monument Road, BIRMINGHAM.
London Showrooms:
144, Great Portland Street, W.1.

The L.M.C. suspension will be on view at the forthcoming Motor Cycle Show at OLYMPIA (STAND 70).

CARS FOR SALE.

OLYMPIA, White City, and West Norwood this year. Sorry we've had to house the Show in these three places. You see, I didn't want to get all my lot into Olympia, or else many of the others wouldn't have had much room. Besides, my systematic reduction scheme wouldn't have given Vauxhall's a fair chance.—Cox (below).

OVER £2,300 Reductions reached this (eighth) week under my systematic reduction scheme. Let me again explain it. I reduce my prices by £250 per week, not less than 10 cars being reduced every week. This week 23 prices reduced by £270.—Cox (below).

MOTOR Cycles.—1920 Wooler flat twin countershaft lightweight, list price £103, shop-soiled only, £80; 4h.p. 1918¾ Douglas coachbuilt combination, 3-speed, kick starter, clutch, £85; 6h.p. 1914 A.J.S. coachbuilt combination, 3-speed countershaft, kick starter, hood, screen, £115; and an absolutely posh 1918 Harley-Davidson super-sporting combination, dynamo lighting, low Zeppelin-shaped coachbuilt sidecar, it, £175.—Cox (below).

SYSTEMATIC Reduction Scheme pays you and satisfies me. (It may be an expensive way of obtaining money, but, anyway, it's better than not getting it at all.) 10-12h.p. Darracq 2-seater, originally £95, mag., live axle, runs splendidly, £40; 6h.p. De Dion parcels van, mag., £55; 18h.p. Dennis van, worm drive, Zenith, Bosch, smart, fine lot, reduced from £135, gift, £85; landaulet body, cord, £85; 15h.p. Bayard roomy van, Zenith, fine lot, reduced from £165, clear £95; 20-25h.p. Iris chassis, Zenith, gate, live axle, fine lot, £135; 12h.p. Sizaire-Naudin sporting 2-seater, discs, fast, smart, £135; 20h.p. Leon Bollee chassis, live axle, enclosed valves, £150; 14h.p. Wolseley 4-5-seater, live axle, gate, Zenith, £165; 8-10h.p. Crescent streamline 2-seater, Blumfield V twin water-cooled engine, 3-speed, smart, £165; 30h.p. worm drive landaulet, cantilever springs, luxurious body, 4-speed, gate, Zenith, absurd bargain now, £185; 8-10h.p. Warne light car, steamline 2-seater, dynamo lighting, discs, live axle, gate, £185; smart little 8-10h.p. 1913 Globe coupe light car, Claudel, gate, £195; 12-16h.p. 4-cyl. Decauville super sporting 4-seater, low, absolutely streamline, bulbous back torpedo, bargain, £195; 30h.p. worm drive landaulet, cantilever springs, luxurious body, 4-speed gate, Zenith, absurd bargain now, £195; Unic 15-cwt. van, sump lubrication, monobloc, detachables, originally £350, now £225; 1920 Bleriot Whippet cycle car, 8-10h.p., detachable wheels, £235; 16h.p. Bell landaulet, enclosed valves, gate, sump, £235; exceptionally nice camouflaged Ford 4-seater, C.A.V. dynamo lighting, pointed bull-nosed brass radiator, detachable rims, oversize tyres, saxe blue, extras alone cost £100, bargain, £245. —Cox (below).

SYSTEMATIC Reduction Scheme. Almost produces bargains by mass production: Sporting Delage streamline 2-seater, bulbous back, dynamo lighting, 10h.p. monobloc, fast, £245; G.W.K., detachable wheels, £250; particularly smart 12-14h.p. Unic torpedo 5-seater, monobloc, sump, £275; 18h.p. 6-cyl. streamline torpedo, £285; smart 15.9h.p. 1912 Darracq, sleeve valve, roomy torpedo, worm drive, 4-speed gate, Zenith, £385 originally, £285; nice 11h.p. 1915 Lagonda light car coupe, 2-seater, bull-nosed radiator, detachable wheels, streamline, £295; 1-ton 1916 Clydesdale lorry, £295; 12-15h.p. Opel landaulet, monobloc, gate, cord, Zenith, £295; 10h.p. 1920 H.F.G. 3-seater, dickey, opposed twin, C.A.V. dynamo, detachable wheels, starter, £325; 15-20h.p. Chevrolet 3-seater, English coachwork dickey, dynamo, starter, smart, £335; 15.9h.p. Knight-Daimler 4-seater, worm drive, detachable wheels, smart, bargain, £350; 12-15h.p. Crossley 3-seater, dickey, monobloc, enclosed valves, detachable wheels, £350; smart 12-15h.p. 1913¾ Sizaire-Naudin streamline 5-seater, monobloc, detachable wheels, £365; 15.9h.p. Arrol-Johnston 3-seater, dickey, enclosed valves, detachable wheels, smart, £365; particularly posh 11.9h.p. 1913¾ Humber streamline 4-seater, enclosed valves, detachable wheels, £375; 12-15h.p. 1913 valveless Darracq streamline torpedo, detachable wheels, 4-speed, smart, £385; exceptionally smart 1915 Bedford-Buick 3-seater, 15-18 h.p., double dickey, English coachwork, C.A.V. dynamo lighting, Zenith, gate, detachables, £385; 9.5h.p. 1915 Standard light car, C.A.V. dynamo lighting, £385; particularly posh 12-18h.p. Benz streamline torpedo, enclosed valves, 4-speed, £385; smart 15.9h.p. Gregoire 2-seater, C.A.V. dynamo, enclosed valves, detachable wheels, £395.—Cox (below).

SYSTEMATIC Reduction Scheme also applies to all other cars in stock, but cars over £385 not advertised here. Full list in "The Autocar" and "The Motor," including cars up to four figures, some of the finest super-autos obtainable anywhere, also light and heavy commercials, 1-5-ton lorries, 3 chars-a-bancs, and all types. 60 cars actually in stock. Full printed list free on application. Send P.C. right away, immediately, forthwith, at once, straightaway, now.—Cox (below).

Sound Progress.

THE outstanding difference between the Car Shows of 1919 and 1920 lies in the fact that there is less evidence of experimental designs. A similar state of affairs is likely to be revealed at the Motor Cycle Show which opens at Olympia on the 29th. At both car and motor cycle shows last year there were many exhibits which the makers had hurriedly put through the first stages without that testing for roadworthiness or efficiency so essential for a vehicle to be a commercial success. Further, in many cases no arrangements had been made for production, the combined result being that these machines did not appear on the market.

The present Automobile Show includes many of these cars, with the great difference that they have passed all tests and have been produced with the proper jigs and tools instead of in an experimental department.

Sound progress embodying much that was learned during the war is revealed to all who understand mechanics, and the British automobile industry can again be regarded as leading the nations on points of refinement, quality of workmanship, and design. It is the greatest motor show that has ever been held, and the interest displayed by the public is such that it leads one to expect a prosperous period in 1921.

At the Motor Cycle Show also we shall see more restraint than last year, when new machines were exploited before they were ready for production. Whatever progress is revealed will be real and based on more than theory.

From our knowledge of conditions prevailing at the present time, we may say that those who expect any revolution in design, or even many drastic alterations, will be disappointed. Last year's lesson has been thoroughly digested by those manufacturers who have entirely new models. Many of these have passed through the experimental stage, and few, if any, machines will be exhibited which their makers are not in a position to deliver. There will also be less of that pre-war policy of changing merely for changing sake, which is all to the good. Improvements will be embodied in almost every machine which is staged, but they will be chiefly details which have been thoroughly tested before their inclusion in production models. The time has gone when motor cyclists were content to prove the merit or demerit of an untested design.

A Taxation Query.

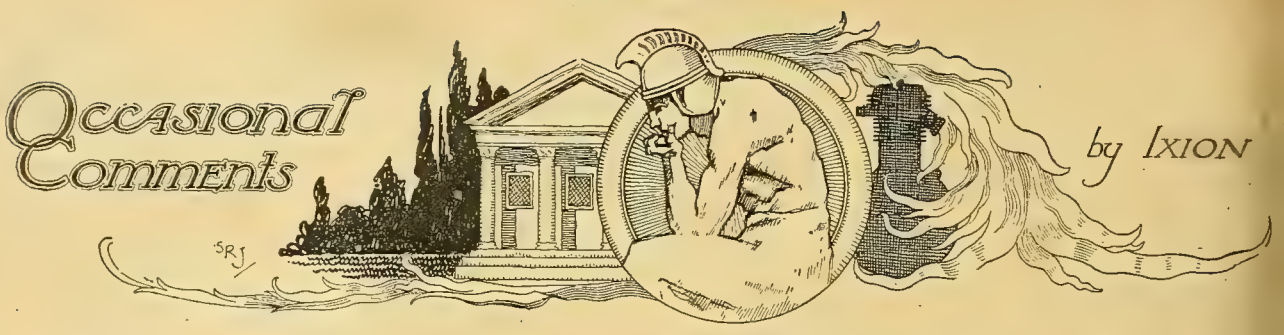
FROM January 1st, 1921, the authorities will require to know the weight of a motor cycle before accepting the annual tax. If one claims that a machine is over 200 lb. in weight, and therefore subject to a £3 or a £4 tax, the statement is not likely to be doubted; but in those cases where a machine weighs under 200 lb. one is contrained to ask what arrangements are being made to ascertain the correctness of the figures.

There are obviously many convenient ways in which this may be done, but whatever the authorities decide, the same rule should apply all over the country. Yet we hear of local authorities discussing the matter with a manufacturer and formulating plans for that locality.

Only about six weeks remain before the new taxation comes into force, and so far no official announcement has been made as to weighing machines. Are the authorities collecting weight figures from the manufacturers? We think not, but if they are, this would cover only new machines of standard patterns. What of the thousands of machines now on the road? Are their owners expected to have them weighed at the local weighbridge? If so, who will see that half the machine has not been removed for the purpose of reducing weight? Does the taxable weight include accessories, and, if so, what is an accessory?

These are some of the questions we are being asked daily by owners of lightweights. It is time the Treasury Department made known its requirements.

An Index to the advertisements in this issue will be found on the page facing the back cover.



A Corollary.

ANY correspondent who puts in a long life record claim for a naked chain ought to specify the make of the chain and the shock absorber employed. Tell it not in Gath, but not so very long ago I smashed three rollers on a newish *enclosed* chain. It wasn't a very good chain, and as for the shock absorber—. . . . ! Chains vary in quality almost as much as belts used to do; one of my colleagues on *The Autocar* has a silent chain on his 'bus; it is partially enclosed, well lubricated, and takes a light load—but it doesn't last him a season, nor yet half a season. Similarly, some shock absorbers make the chain feel as if it were being tickled with a feather, whilst others make it dream of being entangled in the propellers of the s.s. *Imperator*. These factors explain many divergences.

Naked Chains.

"SIMPLICITAS," and those who think with him, will ultimately compel me to buy a microscope, a micrometer, and a Röntgen ray set. Various kind friends are always telling me that if only I would boil my chains in tallow, I should get just as many miles from them naked as enclosed. It may be true. The last time I boiled my chains in tallow, our invaluable cook gave notice, and my wife talked of a divorce. Not only had I innocently commandeered the best aluminium saucepan, waked the baby with my oaths, made a nauseous smell which hung round for weeks, and spilt boiling fat everywhere I shouldn't, but also burnt my fingers most—[Clergy of all denominations read the *M.C.*—ED.] So nowadays I merely soak naked chains in engine oil. It may be that boiled tallow seals the chain bearings against the ingress of abrasive dirt; but soaking them in oil seems to have a capillary effect on grit, and positively drags the abrasive into the bushes. Will not Messrs. Renold or Coventry Chain intervene? They have doubtless tested chains to destruction under a variety of conditions, and know the facts. I remain sceptical about the tallow boiling business, but for obvious reasons am unable to conduct further experiments. Oil-soaking is *na poo*. So—pending expert advice—I am all for enclosed chains at present.

First Cost and Upkeep.

NOW that the Ford car and numerous cycle cars are obtainable at a first cost which does not exceed the figures asked for sundry motor cycle combinations *de luxe*, the wealthier members of our fraternity will have to clear their minds about the contrasts in upkeep. It is true that if you have £250 or thereabouts to spend, you may choose between a 20 h.p. four-seated car and a sidecar outfit. You may buy which you please. It does not follow that you can afford to maintain either of them. I have known quite shrewd motor cyclists overlook the fact that a four-wheeler has four wheels, each of which costs nearly £10 to tyre for, say, 4,000 miles. One audacious fool of my acquaintance, who subsists on a weekly wage of none too princely a character, has recently bought a left-hand steering Ford on the ground that it was better value than a Harley sidecar at £225. So it was. But he cannot afford *(a)* to retyre it; *(b)* to pay the £22 10s. tax with which it may be debited on January 1st, 1921; and finally *(c)* he cannot even afford to sell it at the present time, since he dare not face a loss on the price he paid.

To name another aspect, so long as petrol remains at well over 3s. per gallon, the contrast between the fuel consumption of a bicycle and a car is colossal. The other day I got in ten cans, and expected them to last me for quite a bit, since my usual mount approach 100 m.p.g. A pal brought down a 30 m.p.g. car for August week, and he used up my store in less than seven days. In this case the contrast was 600 miles compared with 2,000. His holiday cost him about £6 for petrol, whereas if he had taken it on a big sidecar outfit he would have spent no more than £3 in fuel at the outside. Other costs are roughly in proportion.

Concentric Wiring for Electric Lamps.

IT would be interesting to hear electrical experts on the subject of the best wiring for motor cycle lighting outfits. Some firms use wiring which might be described as "concentric," *i.e.*, the current travels out from the battery to the lamps along the core of the cable, and returns along a tubular lead encircling the core and insulated therefrom. It is obvious that this type of cable hardly permits of roadside repair, and that nothing short of a most extensive "service" system would enable us to get replacements anywhere and everywhere. No matter how sturdy cables may be, some of their runs on a motor cycle are remarkably vulnerable to accidental damage—burning, abrasion, pulls, and so forth. I have been hung up once or twice this year with internal shorts in this type of cabling, which present very awkward problems by the roadside on a dark night; whatever "service" system may be elaborated, the obtaining of spares is rather a gamble as yet. No doubt there are excellent reasons for the policy, but some of us would like the matter ventilated before next winter comes round. A single-pole wiring system with earth return might be more liable to serious shorts, but at least is easier to "fettle up." Or again, do not two parallel wires inside a casing lend themselves to repair better than the "concentric" type?

Haggard Faces.

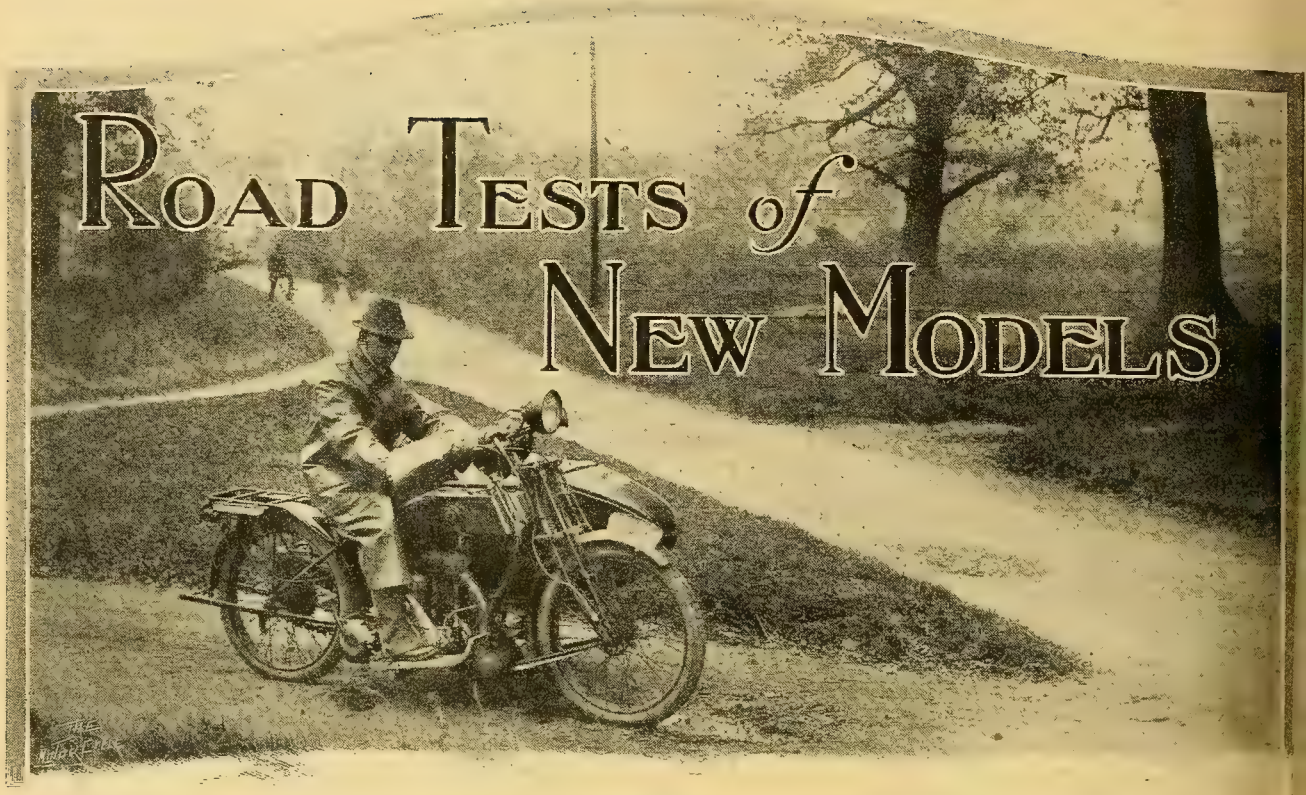
OUR roads are not quite so bad as some scribes imply, but although long stretches are excellent, occasional patches are really too frightful or words. In fact, isolated bits are almost intolerble, even when one's anatomy is insulated by 3in. ires and a spring frame. During a recent run I equently dismounted in sheer despair, and I caught ith sympathy the expression of mute agony which ie atrocious surface had imprinted on the faces not nly of motor cyclists, but also of the crews of quite g cars. One or two men who were bestriding rigid-amed solo 'buses or "combinations" with empty side-rs dismounted and confessed that the gilt was off e gingerbread. I interviewed more than one road rveyor, and all of them had a threefold lament—thorities hard pressed for funds, labour disinclined produce output, and fast, heavyweight traffic knock-g a road to pieces as fast as it was restored to order. ney admitted that they would never again be able to t topsides with their job until a revolution in road nstruction was joined to unlimited financial re-arces. From our point of view I implored them ver to confront us with *long* stretches of continu-sly bad road. We can just stomach a mile of awful t-holes or ripples at a time, if a succeeding stretch two or three miles lets the vibration evaporate out our jawbones; but fifteen successive miles of rotten ng, such as I struck in one seemingly endless patch t week, is enough to make the keenest motorist take ballooning for a change. In the meantime, the elopment of the lightweight is getting held up, so as long-distance, cross-country riders are concerned. are making up our minds to tolerate dead weight so long as we can have walloping big tyres, plus a fully sprung frame. I met one innocent who was near completing a 300 mile trip over a route which includes an unusual percentage of bad patches. His mount was a particularly dithery featherweight, and his language resembled a two-stroke exhaust in which the proportions of the petroil have been accidentally reversed. As I had been trying various pressures in my 3in. tyres, the state of the road can be better imagined than described. Luckily it recovered ten miles further on.

Umbrella Coats.

DUNHILLS inform me that for some years past it has been impossible to obtain the moulded rubber necks essential for "umbrella" coats, and that the short life of these garments always militated against the sales. They consider that their poncho neck coat is an efficient substitute, especially as most customers expect a mackintosh coat to last four or five years. In this connection perhaps somebody will tell us if there is such a thing as a waterproof coat which doesn't want dry cleaning at short intervals. I have several which are structurally and atmospherically perfect, but after about three months' wear they all contract a general grubbiness which is most repulsive. I am not alluding to the stains of lubricating oil or rubber solution with which most motor cyclists sooner or later disfigure their attire, but to a uniform deposit of grey smuttiness. The average waterproof seems to have a most magnetic effort on any circumambient dirt; and dry-cleaning has become very expensive; moreover, some dry-cleaners remove the proofing along with the dirt.

EXPLORING OLD-WORLD VILLAGES WITH AN A.J.S.

These quaint old cottages, among many which still survive in Warwickshire, are in Stoneleigh village, one of the prettiest little hamlets in the county.



THE 1921 ARIEL "BIG SINGLE" SIDECAR OUTFIT.

ONE may say that there are two distinct types of sidecar outfits. One is the lighter machine with sidecar *attached* which gives the impression that the motor cycle is pulling the sidecar, and the other the larger type which seems to move along as one complete vehicle.

The new big single Ariel is in the latter class—a machine in which no attempt has been made to make it serve a dual purpose.

Designed from the first to the last detail as a sidecar machine, it is larger, heavier, and stronger than the usual double-purpose mount. Its tank has a capacity for 2½ gallons of petrol. The wheels are 28 × 3in., and the forks are wider than those on the majority of big sidecar machines. We will, however, deal with these details at a later date, when we are able to describe the machine as it will be marketed next year. Our present purpose is to give our experience of the machine on the road.

A Sturdy Outfit.

Our first impression was one which inspired the first paragraph, for immediately one bestrides the machine one feels that "heftyness" which characterises American big twins and some of the larger British machines. This first impression leads one to expect more than a 580 c.c. single can give, and from force of habit, when getting under way, the gear lever is snicked over into second and top within a few yards after the manner adopted with the largest machine.

The willing engine, protesting against such ill-treatment, gives a gentle reminder that it is only a single and not a 1,000 c.c. twin, and one remembers the to give it time to pick up before changing up.

A single-cylinder sidecarist would not notice this, and the big twin rider soon schools himself not to be led astray by the size and comfort of the machine.

On this latter point we may say that the comfor obtained by the large wheels, the splendid sprin forks, and the Ariel saddle suspension is such tha is rarely experienced, except on a spring fram machine. The steering, too, is perfect, it bein possible to take the hands off the handle-bar withou the wheel setting up that uncomfortable wobble s pronounced with lighter sidecar machines.

The Price of Comfort.

As regards its general performance, one may com pare it with a well-tuned 3½ h.p. machine fitted wit a sporting sidecar, the extra power developed b the engine over the smaller type apparently being use to propel its extra weight, and the full touring sidecar which, as a rule, is only a practicable proposition on big twin. Thus we may say that the new Ariel is a ful sized outfit with a single-cylinder engine, and has a the "liveliness" of the Ariel 3½ with a sportin sidecar plus the comforts of the big twin.

The engine has mechanical lubrication, and th machine we tested had a Magdyno fitted, which optional equipment for 1921.

ad Tests.—

The sidecar was ell loaded, and ne of our longest ns was in the rk over strange ads, when optical lusions as to adients usually ll for a great deal gear changing th a single-inder outfit. The headlight ve a powerful m, and, on the el, day-time eeds could be de, but there are es when climbing ill—say, up short p rises to the w of a bridge—n the projected ht points sky-rds, and it is ossible to see ch way the road ntinues. This ns a finger con-ntly on the ttle lever, eyes rt, and an gination distort-possibilities. It e hardest con-n under which an overloaded "single" can be d, but we found no undue necessity to use the lever, and, therefore, there is no impression that engine is overloaded.

e also took the machine up Beacon Hill—a test frequently in Midland competitions. With a nger in the sidecar the greater part of the hill negotiated in "second," and such was the reserve wer that it was possible to pick one's way rather the more usual method with a single-cylinder ar on such hills when the throttle is opened wide confidence placed in a kindly providence that will be no necessity to close it.

spite the all-chain transmission, the drive is ularly sweet, except at the lowest speeds in top ge. The engine is very flexible, and the

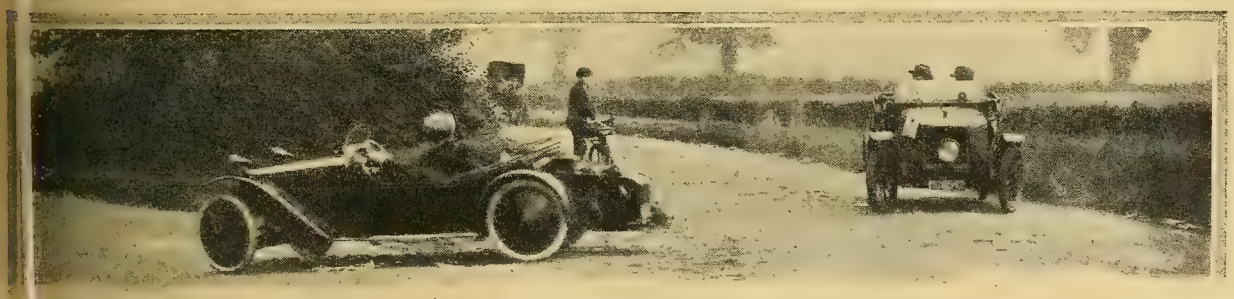
THE 4½ H.P. ARIEL ON THE ROAD.

With a camera and sidecar among the falling leaves. Equipped with handle-bar muffs and adequate clothing, there are worse ways of spending a late autumn afternoon than on a good machine.

semi-automatic carburetter reduces the control to that of a single lever. The machine was handed to us equipped with a pair of large handle-bar muffs, which to anyone strange to a machine are somewhat disconcerting, since all levers are out of sight, but at no time was it necessary to find the magneto lever to retard it, and only on the steepest of the top gear hills was the air lever drawn back a little.

As is the case with the well-known Ariel "3½," the new engine is fitted with a decompressor for easy starting, no exhaust lifter being fitted. The lever controlling the decompressor is now placed in a forward position near the clutch pedal, and immediately below it is a small lever regulating the flow of the mechanical lubricator. We found that a stranger, in "feeling" for the clutch pedal in the dark, may inadvertently move either or both of these levers, and, if the decompressor is put into action, there will be a falling off of power, quite mysterious until the truth is realised.

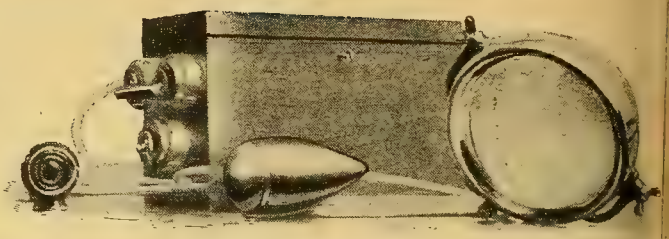
On the road the machine, although not exceptionally fast—by which we mean speeds over 40 m.p.h.—proved capable of maintaining similar averages to those secured with larger engines. This means that it can work up to its maximum and maintain it for miles on end, and any owner will find that it is a sidecar outfit with which he need not hesitate to take anywhere without choosing the easiest route. Thus the new Ariel gives most of the advantages of the big twin with the comparative simplicity of the single.



his issue are described the four-wheeled cycle cars at Olympia and the White City which are of interest to motor cyclists. Here are two of them on the road—the little A.V. Bicar and the Crouch.

Accumulator Lighting for Sidecars.

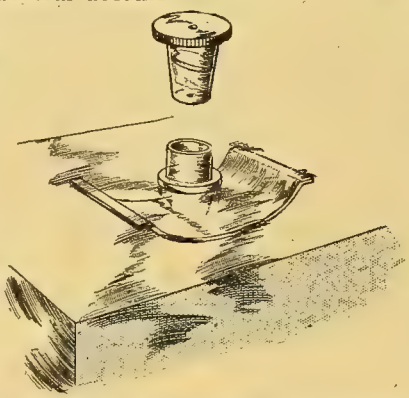
Directions for the Amateur as to the Best Method of installing a Lighting Set.



The accumulator lighting set complete.

MANY motor cyclists declare emphatically that they would never fit an accumulator lighting set, on the score that the cells require too much expert attention, and that the acid is too "messy." Yet the attention required by a cell is practically negligible if it is given at the right time, and the trouble due to the acid can be guarded against quite easily if, in the first case, one buys cells with properly fitted splashguards and vent plugs, and if the box carrying the cells is so secured that it cannot be overturned.

The writer has designed and fitted several accumulator lighting sets, which have given satisfaction in every way, and the last two sets fitted are the outcome of much thought on the subject. Attention has been paid to details, and it is hoped that these notes, based on experience, may not only help, but encourage, others to carry out little schemes to make night riding a pleasure.



Type of splashguard and vent plug found to be effective against splashing of acid from cells.

In general, a good head light is essential to night riding, and for this reason an eight-volt set is preferable to a four-volt set. As the side and tail lights need not be so powerful, four-volt bulbs are quite sufficient. The outfit was based on these lines. It will be seen from the diagrams that the four-volt side and tail lamps are not in series. The disadvantages of having these lights in series are that it is not always possible to get the bulbs in pairs, as is necessary for this system, and that in the case of the breakdown of one of the four-volt cells, all lamps can be run in parallel of the other cell.

Choosing the Batteries.

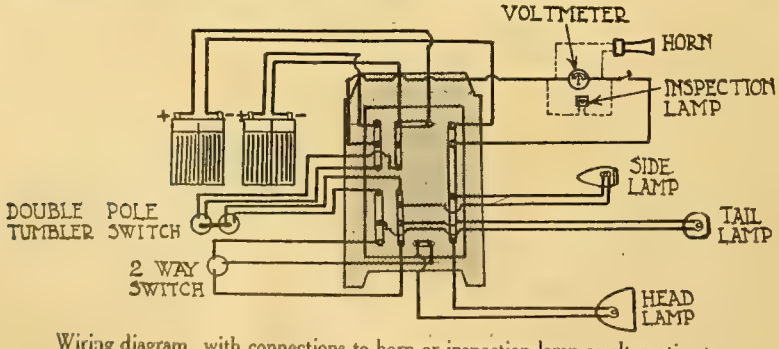
Care was taken in the choice of the writer's equipment, which included two four-volt 40 amp.-hour accumulators. A strong celluloid case is as essential as sturdy, well-formed plates, and the perforated insulation between the plates was examined by holding up the cell to a strong light. This method of inspection shows up any flakes that may have fallen and caused an internal short-circuit. Great attention should be paid to the splash-preventing device fitted and to the vent plugs. The writer favours the device illustrated, which have been found very suitable indeed. Specially fitted "non-spillable" types of cell were found no more efficient than ordinary cells fitted with these features, and a "non-spillable" ce must be very carefully selected, as a careless designer is prone to seal the exit for acid so well that the ga evolved during the charging process so effectively trapped that it eventu ally finds a way out—through hitherto sound joint!

The cells should be filled wit acid, given their first charge, di charged, and again re-charge exactly in accordance with th maker's instructions found on the sid of the case.

The Accumulator Box.

All joints of the accumulator b should be dovetailed, carefully fitte glued, and screwed with brass screw A small flush lock should be a final additio The cells chosen in this case were 4in. wi by 4¼in. long, and 7in. high to the top of t terminal screws. The front, back, sides, to and ends, were made of ½in. material, whilst th bottom was so shaped to keep the top of the ca properly level, as in most sidecars the floor slopes fro the nose to the front edge of the seat. This slo should be measured and allowed for on the width f the box. The cells should be a good fit on thr lengths, which run with the length of the bo but should be rather an easier fit on their width, p manent partitions were of ⅜in. teak, al were shaped to fit the box. These we also slotted at the top to take the ca from the cells to the junction board; t metallic armouring, of course, being tak off the cable from those portions com inside the box.

The fixed partition nearest to the junctio board takes two cables, one over the oth The junction board was also of ½ teak, and slid easily into the grooves in t box. To add a touch of smartness a 5 × 3½in. piece of ⅛in. thick black fi was obtained to go under the .250 × .018 bright annealed copper busbars.



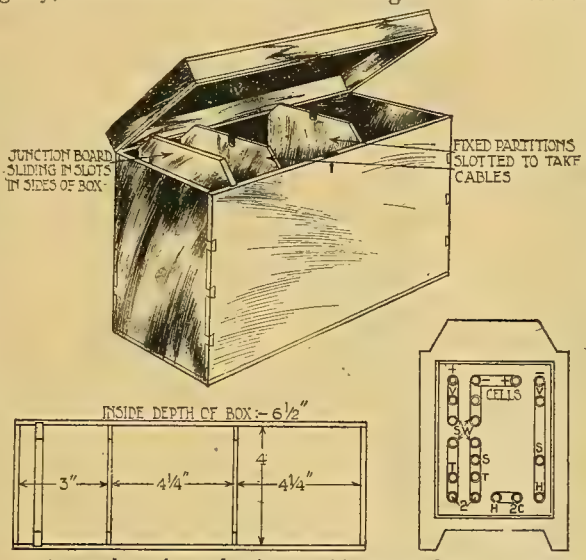
Wiring diagram, with connections to horn or inspection lamp as alternative to voltmeter.

Accumulator Lighting for Sidecars.—

In measuring up the copper strip (eighteen inches is all that will be required), care was taken to ensure that the terminals were equally spaced, and exactly opposite to each other. The ends of the strip were cut to the radius of the bottom diameter of the terminals, and holes drilled in the strip to receive the terminals, of the same diameter as the top of the wood screw on the terminals. The holes were then marked with letters shown in the diagram, to facilitate the wiring.

The switches required are: a five-amp. double-pole tumbler-switch, and a five-amp. single-pole two-way switch. Each switch was fitted on a ⅛in. rubber disc, cut to the same size as the switch-base, and cut out to take the leads. In fitting the double-pole tumbler switch, the switch was put into the "on" position before screwing up tightly, as these switches have sometimes proved refractory if fitted on in the "off" position. The double-pole switch is placed so that when the switch bar is down the switches are off, so that the bar must be lifted to switch current on.

Perhaps this is the moment to explain the use of the two-way switch. When riding in well-lit town streets, or when leaving the machine standing outside a house whilst paying a visit, the powerful head light is not necessary, and by switching over this two-way switch a four-volt e.m.f. is put on to the eight-volt filament, and this produces a light quite sufficient for the purpose. This, of course, is a great current saver, besides being useful for another purpose, viz., should the eight-volt bulb break, a spare four-volt bulb can be put in, and the four-volt side of the switch used, thus providing a satisfactory stand-by.



Accumulator box, showing partitions and slots for cables. On the right is shown the junction board. The concentric circles represent terminals. The letters are stamped where possible on the copper strip.

Minor Accessories.

The three terminals marked "V" were primarily intended for use with either a four-volt or an eight-volt inspection lamp, which has a turn switch incorporated in the lamp. This is not run off the main lighting switches for obvious reasons. However, as some of the present-day head lamps allow of the bulb and bulb-holder being extracted and used as an inspection lamp, these terminals may be used for a flush-type voltmeter let into the lid of the box, in series with a midget "press" switch. The voltmeter should be checked for accuracy, the point 7.2 volts (*i.e.*, 1.8 × 4) being specially marked as the lowest discharge point of the battery of cells. As another alternative, these terminals may be used for connecting up an electric horn, an accessory which will provide a method of using the cells during the summer months.

The box was fastened down to the floor of the sidecar by two bolts with round heads. These heads were countersunk into the bottom of the box, and the accumulators each rested on two pieces of ⅛in. thick rubber sheet. About 4ft. of 1in. wide white cotton tape was made into a ring, and this ring was lowered into the cell compartment, leaving a loop overhanging on each side of the box, and the cell put into place. The cell can now be readily lifted out for re-charging, without pulling at the terminals. A tape ring was made for each cell. This is the reason, of course, for allowing a little space at the sides of the cell compartments.

The Wiring System.

Either brass or aluminium armoured cable can be obtained, and one of the conductors is usually bound with red cotton. This is useful in wiring up from the cells to the junction-board, as it saves "tapping through." The accumulator ends should have slotted lugs soldered on for good clean contacts, and for quick attachment or detachment. The leads from the double-pole switch can be the ordinary silk, or glazed, cotton-covered, twin flexible wires. For the two-way switch, similar material can be used, but, in addition, a piece of the single wire may be stripped, leaving only the rubber, then the pair unstranded and restranded, adding the plain rubber-covered wire, and serving the ends up with white cotton. The plain rubber-covered wire is a very well marked common wire for the two-way switch. All wires terminating at the junction board should have soldered ends, which should not be bared beyond ¼in.—just enough, in fact, to pass well under the terminal screws. The ends of the insulation should be bound with white cotton, as well as all take-offs of the single wires from the cable, and all ends of armouring. The cotton serving should then be lightly smeared with seccotine. One should be careful to allow no armoured wire to go into the junction box.

The cable is best fastened to the frame members by means of the soft aluminium clips sold for the purpose. Allow in length of cable for the turning of the handle-bars, and for the springing of the sidecar body, and see that it will not interfere with the taking off of any nuts on the frame or chassis and their connections.

The lamps required will be: one 12 c.p. eight-volt for the head light; one four-volt (candle-power as required) for the sidecar; and one four-volt 2 c.p. for the tail lamp—all with the same size of bayonet sockets, of course.

A neat diagram should be made on thin card, and finished in drawing ink, showing all wiring. This can be fastened to the inside of the box lid with drawing pins.

F. WOODFIELD.

AN EASILY FITTED SPRING SEAT-PILLAR.

IN view of the state of the roads at present, it is not surprising that auxiliary springing is very much to the fore, and an efficient spring seat-pillar readily adaptable to existing machines and varying weights is sure to satisfy a growing demand.

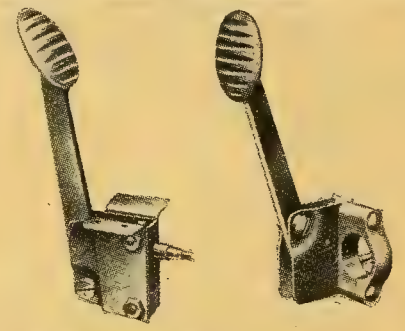
The Mabon Motor Works, of Woodside Gardens, Bruce Grove, Tottenham, are therefore producing a fitment which will make its appeal on the lines indicated.

A seat-pillar such as the Mabon, here fitted to a Triumph machine, does much to insulate the rider from the shocks of the all too numerous pot-holed roads of to-day

The photograph makes the action quite clear, and, having recently tested one, we find that it is just as efficient in action as it is strong and well finished in appearance. In fact, so excellent is the suspension afforded on the most atrocious surfaces that we were apt to forget that the machine was not similarly insulated. In conjunction with the T.T. bars of the solo machine on which we tested the pillar, it made the riding position somewhat awkward, being necessarily some 4in. higher than standard. This, however, should not be a serious fault if touring bars were used, or on a machine to which a sidecar is attached.

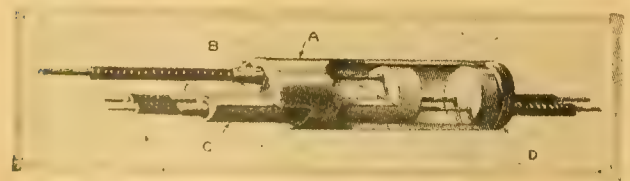
BOWDEN NOVELTIES FOR 1921.

ONE of the chief novelties to be exhibited by Messrs. Bowden Wire, Ltd., Victoria Road, Willesden Junction, London, N.W.10, is an ingenious form of belt rim brake which may be fitted to either the front or back wheel of a motor bicycle. Naturally, if the brake is to be fitted to the front wheel or to a chain-driven mount, a dummy belt rim must be provided. The brake has an absolutely parallel motion, and is provided with two strong take-off springs. The clips, by means of which it is attached either to the fork member or the chain stay, are capable of being adjusted so as to suit themselves to the curve of either. Two screws are also provided for the lateral adjustment of the brake shoe. This brake, we are informed, has excellent stopping powers without actually locking the wheel.



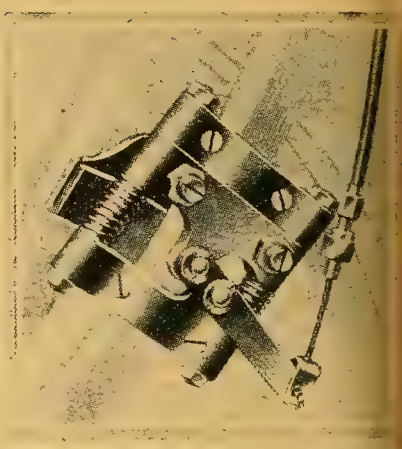
Two patterns of brake pedals for attachment to foot-boards or frame tube.

Quite a novelty for the coming season is the Bowden Master control, which may be used in two ways on a motor cycle. One method of using it is by fitting a small trigger-like lever to the handle-bar and connecting to the moving portion of the device, through which the two wires pass leading from the throttle and air levers on the handle-bars to the throttle and air slides on the carburetter. The small lever on the handle-bar can then be used as an accelerator, and, if it is operated, it will open the throttle fully on it being given quite a small amount of movement without altering the relationship between the throttle and air levers in their original setting. The second method in which the device may be used is in connection with the clutch control, and by its means it is quite simple to arrange for the clutch to be actuated either by hand or by foot.



The Bowden master control. (A) Outer casing. (B) Wire to accelerator lever. (C) Moving plunger to which B is attached, and through which the wire to levers and throttle and air sleeves pass

Two improvements have been carried out in the design of brake and clutch pedals; one of these, working in a quadrant which limits its range of action, is provided with a toggle which gives a straight pull on the wir thus considerably adding to its life. Th other pedal is light and simple in desig It may be supplied either with round cli or oval clips, or can be made easily attac able to the under part of the footboard



The new Bowden brake for front or rear wheels.

A WEATHERPROOFING IDEA FROM ABROAD.

THE Henderson, by reason of its lar four-cylinder engine, is already pr bably the nearest approach to t much-discussed, if rather mythical, tw wheeled car. However, Mr. V. Ingve son, of Helsingborg, Sweden, has go further to making the statement a fac

The photographs show a combined wi and mudshield which he has designed f his mount, and which appears to gi ample protection from the elements. T upper, or "dash," part of the shie

A Swedish reader's device for weatherproofing his Henderson.

may be raised or lowered, while the fo part forms a roomy compartment storing spares or supplies. Mr. Ingv son states that the cooling is more e cient than before, as the wings on bo sides of the front wheel direct the a forcibly against the cylinders. Th machine can be upset without the scr touching the ground at any point.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters must be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

TRUE TO HIS FIRST LOVE.

Sir,—I have taken over a new 8 h.p. Rover light car and parted with my old 1913 P. and M., but I find I cannot give up *The Motor Cycle*. My respects to "Ixion," be he myth or flesh. H.G.S.
Carlisle.

UNDER DIFFICULTIES.

Sir,—I find every issue full of good things and thoroughly interesting—in fact, to enjoy motor cycling in the poorest spot on earth (the Persian Gulf) with *no* roads and *no* motor cycle, buy *The Motor Cycle*. C. H. ST. JOHN.
Jask, Persian Gulf.

BENZOLE-PARAFFIN RESULTS.

Sir,—I have noticed of late riders obtaining fairly good results with a mixture of petrol and paraffin. I wonder if my rider can beat my results. The machine, a 1920 Triumph, using a mixture of 50% benzole and 50% paraffin, regularly does 95 m.p.g. and 50 m.p.h. These figures are not approximations but actual results. DC1654.
Bromley.

THE UMBRELLA COAT.

Sir,—Referring to Capt. Summer's letter *re* "Umbrella" coat, I believe he would find the "Poncho" coat, manufactured by Messrs. J. Barbour and Sons, South Shields, to his requirements.

This oilskin coat is about 150in. round the skirt, has no buttons or openings—the coat being slipped over the head and fitted with stormproof gusset at neck. Prices, I believe, range from 32s. 6d. to 40s.

In conclusion I would add that I have no connection whatever with the firm mentioned, except that of a very satisfied user of their garments. ROBERT G. E. KNOX.

TWINS MAGNETO.

Sir,—Having taken much interest in this discussion it may be of some interest to readers of your paper to know that it is a recognised fact to the testers of a well-known make of two-stroke stationary engine (up to 8 b.h.p.) that these engines will run on light load for an indefinite period after about two minutes start from cold, with the high-tension wire removed from the plug.

It is necessary that the load remain constant, then each explosion has equal force; the combustion in the cylinder is more complete before the next charge of gas enters.

Owing to the mixture being weak this allows the piston to pass top dead centre before the force of the explosion is felt. Furthermore, these engines run on paraffin.
RIPPLER BROS.

MISFIRING ON TWO-STROKES.

Sir,—As a student of the two-stroke principle may I be allowed to give a few hints to users, and especially in regard to "Ixion's" recent summary of "Weaknesses."

(1) Most two-strokes misfire at low engine speeds. The cause of this is that the suction is then greater, more petrol is taken, and therefore the mixture is too rich and is almost non-explosive until further weakened by air, when the motor fires strokes. I suggest a remedy later on.

(2) Most two-strokes misfire at high engine speeds under light load (*e.g.*, downhill). I am glad "Ixion" says "downhill" because that is where the four-stroking generally occurs. The cause of this is just the opposite to the low speed one. The suction is low, but there is more of it.

The remedy I find for both the above troubles is the fitting of an extra air ($\frac{3}{16}$) hole on the inlet, and if this is opened at slow speed, and also at high speed downhill, the engine will continue to two-stroke.

Another point that makes for four-stroking is the excess of oil. In the petroil system never more than half a pint to a gallon of petrol should be used, and where an oiling system is part of the outfit great care must be taken against too much oil being given. A little extra is required on ascending hills, but very little extra. With the petroil system the oiling is practically automatic, inasmuch as the oil keeps equal to the speed. JULY.
London, E.C.1.

SIGNPOSTING IN TOWNS.

Sir,—I should like to point out the need for more efficient signposting in the majority of large provincial towns. I have undertaken several long journeys during his season, and on each occasion before starting have thoroughly plotted out my route. Invariably, I have found that, so long as I was on country roads and passing through small towns, the signposts gave all the information I required, but immediately I reached towns of any size, signposts were conspicuous by their absence, and it has always been necessary to stop two or three times in each town to enquire my way. A few examples of towns in which I have experienced great difficulty are Leicester, Northampton, and Winchester. If this matter was taken up by the motoring associations and by the various town councils a great improvement, to the benefit of motorists and the public, could be made at an almost negligible expense.

Every motorist knows that in passing through traffic it is necessary for him to concentrate his mind on the control of his machine and observation of the movements of other vehicles, whereas, if he has to look out for possible signposts at the same time (which generally are in the centre of the town at the most congested point of traffic, and are usually unreadable from the saddle, he can very easily be involved in an accident. CYRIL C. TWISS.

EVERY-DAY RIDERS' WANTS.

Sir,—As a reader of your valuable paper for two years, may I give my opinion of motor cycles in general.

I am a motor cyclist, but not an engineer, and so speak from the average cyclist's point of view.

Present-day motor cycles have too small tanks; freak gears; under-sized wheels and tyres; bad appearance, although American machines are more compact; spring forks, which quickly develop sideplay and rattle; useless front brakes (an extra back brake is much preferable); poor controls often fitted as if an after-thought; and inadequate mudguard and fork clearance (with danger of torn covers).

I consider that engines are very good; but I prefer plain bushes to ball bearings on account of the ease with which they may be replaced.

The service of spares is disgusting. In Glasgow, recently, I was quite unable to obtain a spare valve for a well-known machine. No dealer should be an agent unless he carries a reasonable stock of spares. I pity the Colonials.

In conclusion, my idea of the perfect specification is: American frame, tank, wheels, and control; J.A.P. engine; Sunbeam gear box (final drive on right side more accessible with sidecar); M-L magneto; and no spring frame.

I suggest this motto to manufacturers, "Look after the motor cyclist, and the bank balance will look after itself."
FED UP AND DISGUSTED.

SALVAGING OIL.

Sir,—At the risk of "teaching one's grandmother," I would like to pass on a tip for economising in oil. When a tin is apparently drained, there exists quite a lot on the sides. This slowly descends again to the bottom, but, on attempting to pour it out, it again spreads over the interior of the tin, and none comes out. The tip in question is to let it collect on the bottom by warming the tin by the fire. Then punch a hole through the bottom corner. It is amazing how much comes out, which otherwise would be thrown away. I recently found a dozen so-called "empties" in a friend's garage, and by means of this dodge I salvaged for him quite a nice addition to his tank. I may add that when a tin contains only a couple of inches or so I always empty it by this method; there is less waste, and the process is quicker. ECONOMY.

Northampton.

A GOOD SAMARITAN.

Sir,—May I through the medium of your paper, express the gratitude of my brother and myself towards an unknown motor cyclist, who rendered us most valuable aid whilst on a journey to Cornwall.

We were held up on a very desolate part of Dartmoor, with the magneto broken adrift, and unless help were forthcoming it looked like a night on the moor.

The good Samaritan in question, after having left us, called at several places through which he passed, until he was able to send back from Princetown a car and mechanic, who repaired the damages sufficiently to enable us to reach a garage at Yelverton.

Not only this, but in the kindness of his heart placed in the car two bottles of liquid refreshment to keep our spirits up. Could a sportsman do more?

I would like to take this opportunity of placing on record our appreciation of his help and courtesy, and, not knowing his name, hope that this letter will reach his eye. C.C.

Bromley, Kent.

A LONG TOUR.

Sir,—I took delivery of a new 3½ h.p. Sunbeam in June this year, and about three weeks later started my holiday in Scotland. Beginning at Bristol I made Chester the first day; Windermere was my second stop, about ten miles from which I changed gear for the first time. After that my route was Ullswater (including a visit to Kirkstone Pass, which was accomplished in pouring rain), Penrith, Carlisle, Gretna, Dumfries, Ayr, Glasgow, Oban, Fort William, Fort Augustus, Inverness, Nairn, Elgin, Aberdeen, and Edinburgh, through Yorkshire, and on to London, back to Bristol *via* Dorset and Somerset, a distance of something like 2,500-3,000 miles. About 1,000 were over Scottish roads, which I will not describe, as anyone who has been there will not care to be reminded of them.

The only place the toolbags were opened was near Ballachulish, where I had a puncture, otherwise the machine was not touched, and it is just as well it did not require adjustment, as I am an absolute novice, and have only been riding a year or so. SUNBEAM.

Bristol.

TORQUE AND COMFORT.

Sir,—It would be interesting, to say the least of it, to know how your correspondent, Mr. A. Newsham, has succeeded in overcoming the difficulties attendant on a double-acting internal combustion engine.

If his engine is on the four-cycle principle, doubtless all engineers will want to know how he has increased his cylinder cooling by 100% on existing practice, also how he has designed a heat and flame-proof stuffing-box and packing for his piston rod, and where he houses and how he drives his four valves per cylinder, and places his two sparking plugs.

If his engine is a two-cycle one, he has presumably dispensed with the four valves, and fitted a separate compressing plant.

As an engineer myself, I should like to know what superiority he claims for either of the foregoing over the existing twin-cylinder single-acting two-stroke, *e.g.*, the Scott, and, if any, how it is that our Diesel and semi-Diesel engine manufacturers have not been able to produce a satisfactory engine of this kind? J.S.P.

London, W.C.1.

STAMPED STEEL FRAMES

Sir,—Regarding "J.A.'s" article on suggested pressed or drop-forged motor cycle frames.

In the first place, it is not clear whether he proposes to use pressed steel (sheet metal) or stamped or drop-forged metal.

He writes of pressed steel, but illustrates a structure that could not possibly be produced from sheet metal by pressing. It is unnecessary to point out where the suggested "design" is bad, and, from the point of view of "economy in manufacture," it is even worse, when the size of the steel sheet required is considered, and the amount of waste involved.

Pressed sheet metal can be used to very great advantage on frames of the Unibus type, but on those of orthodox design it is another matter.

Tubular frames can and should be welded instead of brazed, and, considering the complex stresses to which motor cycle frames are subjected, it is doubtful if the tubular construction can be beaten as long as the present general type is maintained. C. C. HANCOCK.

SPEED AND LIGHTING OF TRAMWAY CARS.

Sir,—Is it within reason for us to expect a prosecution by the police against the L.C.C. tramways, for contravention of the lighting regulations?

To quote an instance of contravention: some weeks since, whilst proceeding along South Side, Clapham Common, I noticed all tramway cars proceeding towards London were travelling minus warning lamps—presumably through some mechanical defect.

Under similar circumstances, we all know that any case brought against a motorist would be settled only by the payment of a big fine, and, possibly, an endorsement of the motorist's driving licence.

I should also like to draw attention to the non-enforcement of the speed limit with reference to tramway cars.

To quote an instance of this. On one occasion whilst driving along the Victoria Embankment, a tramway car was proceeding in the same direction. For some distance on a clear road, my speedometer, which I have every reason to believe accurate, was showing *30 m.p.h.*, and the tramway car was *dead level* with me. Whilst not of necessity constituting a dangerous speed for a motor cycle driven near the centre of a broad road, surely 30 m.p.h. constitutes a dangerous speed for so unwieldy a vehicle as the tramway car driven close into the pavement—and incapable of any method of avoiding any absent-minded pedestrian who steps from the pavement into the road.

I should suggest that the advocates of an extension of the tramway service should be compelled to drive a solo motor cycle across London daily, in all weathers.

Victoria Street, S.W.1. C.F.M.

Geoffrey Hill, a Northern competition rider, sends the above photograph with the laconic message, "Nearly 'pegged out' to-day on this Pass. A monk of St. Bernard found me, and I am staying at the monastery shown." Hill has been travelling through Holland, Belgium, France, and Switzerland, and was 8,000ft. up on one of the passes with his Scott when the rarefied air affected the running of his machine.

PETROL CONSUMPTION TESTS!

Sir,—I am encouraged by your correspondents who all get over two hundred miles to the gallon to do two things: First, to ask them why they always specify one single occasion on which they do this, as if the matter were a feat of endurance, only to be undertaken with due preparation; and, secondly, to give my own experiences:

Normal mileage when touring.—90 m.p.g.

When I left the drain cock on.—4 m.p.g. (before I found this out.)

Driving in Essex (fifty-six right-angle bends in flat country in ten miles).—Oh! say about fifteen to the gallon and a new clutch lining.

Proceeding (by train) to Birmingham.—Consumption, *nil.*

My best show was when I boarded the Isle of Wight ferry with *no* petrol in my tank (I had to satisfy the authorities I had none before I could board the lugger). Then, when I disembarked at the other side, I drove fifteen miles with three lunch stops without refilling.

As this may be a record, perhaps I had better say I used a 1902 Minerva, flat tyres, round belt, tube ignition made by my plumber (Mr. Roarer, a very estimable man), American petrol, American oil, and American hot air inlet heater. Usual disclaimer, intensified as regards last three items.

. . . . . .

A friend has just called to say that while employed as Deputy Acting Inspector of False Teeth in the Great War, he drove his machine at a cost of nothing at all for a distance of some 10,000 miles. *And* got the O.B.E., so there now.

Gidea Park. HK 601.

CHAIN DRIVE ON SPRING FRAME MACHINE.

Sir,—I shall be glad if you will allow me space in which o reply to your correspondent, "C.E.P.," as he has referred o my letter relating to the above matter.

If "C.E.P." again turns to my letter he will see that I tated that two other points, in addition to the fulcrum of he rear spring being coincident with the centre of transission (C.S.), were necessary to maintain the transmission ension constant during wheel movement.

One of these two points is radial motion from a common entre of the rear wheel, and this is one of the principal eatures of my design.

Whilst naturally agreeing that all radii of a circle being qual there can be no variation of the chain or belt tension, can be seen, in most rear spring designs of to-day, that ain or belt tension does vary, during wheel movement. he reason is obvious. In practice, the centres of the spring ulcrum, countershaft spindle, and arc of wheel spindle movement are not common. In my design all these three movements are struck from one common centre, *i.e.*, the countershaft sprocket spindle.

I have now disclosed one of the two points mentioned in y letter, the other I do not yet wish to disclose.

Referring to "C.E.P.'s" design, one would not imagine at the use of a jockey sprocket was an improvement on esent design, nor to my mind is it necessary, for in my stem it is possible to move both gear box and rear wheel r chain adjustment, and yet retain the common centre for movement.

Furthermore, the use of a rear frame which is pivoted at e C.S. spindle centre does not constitute an improvement, whilst pivoted at the correct position, it should not be cessary to use any hinge or pivot to obtain radial motion wheel movement.

May I ask where the springs in "C.E.P.'s" design are uated?

G. HAROLD DURSTON.

ECTRIC LIGHTING.

Sir,—*Apropos* the question of lighting, which most motor clists discuss at this season of the year, I have had box made to fit the bulbous back of the sidecar ich takes two 4 volt 40 ampère accumulators, thus, wiring off the two extremes, I get an 8 volt head ht of either 16 c.p., or half watt (32 c.p.), whichr I care to use. For the side and tail, I wire off h accumulator separately, using 4 volt 2 ampère screw bs, giving quite sufficient light for the purpose. The umulators cost 21s. 9d. each, my side and tail lamps T.W.R. aluminium, and the head lamp an F.R.S. 50s. pacity of accumulators (20 hours light) is quite enough the average rider for one month. I have the accumulators charged once monthly at a cost of 8d. I have bought *two* sets of accumulators, and can have one set kept fully charged all the time at the shop ready for use. What trouble is it simply to motor up to the shop, slip your wires off, put the new accumulators in, slip the wires on again, pass *8d.* across the counter, and slip home again? I don't think carbide can compare with this in price, cleanliness, or speed. Bear in mind that the accumulators must be charged once a month, whether in use or not; but what of it! Think of the pleasure of watching the man who passed you at about 50 m.p.h. (when you thought you were going fast yourself), tinkering about with his lamps at dusk, looking for water, and blowing through rubber tubes, just for the sake of doing about thirty minutes ride home after lighting up time, and having to use enough carbide to last for two hours (*that* is one of the great drawbacks to carbide, in my opinion). While all I have to do is to unlock the bulbous back, switch on the three lights, and I am at home by the time he gets going. It is in these short rides that electric light scores for speed, and in the long ones for reliability.

In respect to solo riding with accumulators, I say nothing. In fact, I don't think I would risk it, for I maintain that the accumulators *must* be sprung.

ONE WHO IS *NOT* GOING BACK TO ACETYLENE.

Derby.

COURTESY ON THE ROAD.

Sir,—I should like to draw your attention to two cases of courtesy on the road.

Some weeks ago a motor cyclist pushed his motor cycle, a two-stroke two-speed (Union engine), into the yard of a motor cab company at Brixton, and, scenting trouble, I offered my help.

He did not know what was the matter, but, by the process of elimination, I found there was insufficient petrol in the tank. He asked if anyone could give him some to carry him back to Westminster. I offered to get him some. I had to go to the office and get a ticket for one gallon, which I paid for, and when I told him he said he had no money with the exception of a few coppers, and the machine was not his: he had borrowed it from a friend in the office. I offered to trust him, but I have not heard of him since.

The other case is a different picture.

My son was returning from a holiday in North Wales, and when nearing Oxford he had the misfortune to break the fork springs of his two-stroke. A rider of an Indian and sidecar containing a lady stopped and offered to tow him into Oxford, but this would have been dangerous, as the steering was affected, so he offered to wait in Oxford while the machine was put on rail and my son could ride on the carrier to London. He then rode on. A little distance further on my son came up with them again, helping someone else. He then suggested binding the forks up solid, which they did, and so made the machine rideable.

If this should meet the eye of both riders, I should like to thank the one, and hope that the other will never be in want of a drop of petrol again.

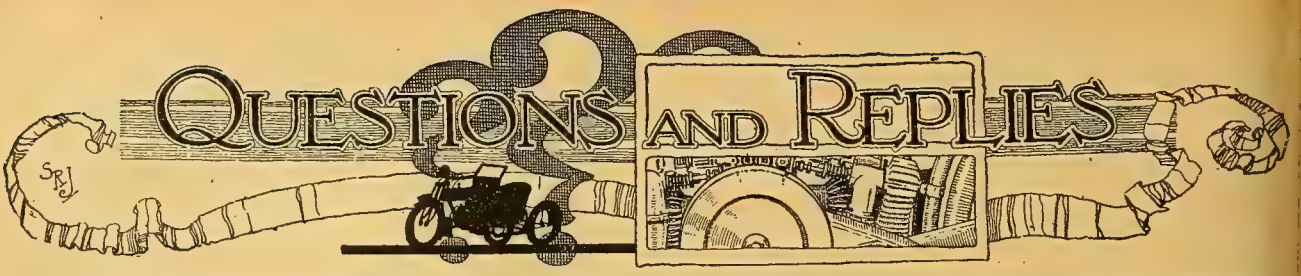
S. CLARK.

BOOKS AND MAPS FOR MOTOR CYCLISTS

Issued in conjunction with *The Motor Cycle.*

	Price net.	By post.
"MOTOR CYCLES AND HOW TO MANAGE THEM." The standard handbook on the motor cycle. Covers every subject relating to all types of motor cycles, their management and care. Twenty-first Edition. Just published	2/6	2/10
"HINTS AND TIPS FOR MOTOR CYCLISTS." Containing over 400 useful "wrinkles" and helpful hints in regard to motor cycles. Seventh Edition.	2/-	2/3
"TRACING MOTOR CYCLE TROUBLES." A reliable system for tracing motor cycle faults and of remedying any trouble when found. Fourth Edition.	2/-	2/3
"THE MOTOR CYCLE" ROAD MAPS **England and Wales, Scotland, London** (showing roads into and out of London and avoiding London). Mounted on linen. Set of three, complete in case.	5/6	5/10
"THE MOTOR CYCLE" ROUTE BOOK. With 32 pages of Road Maps of England and Wales, Scotland, and the London District. New Edition. Just published	5/-	5/4

Obtainable by post (remittance with order) from ILIFFE & SONS Ltd., 20, Tudor Street, London, E.C.4, or of leading Booksellers and Railway Bookstalls



A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C.4, and whether intended for publication or not **must be accompanied by a 2d. stamped addressed envelope for reply.** Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Flickering Electric Lights.

I use accumulator lighting for my outfit, and I have two batteries, which I use alternately. One is now newly charged by an electrical firm, but from both I get a flickering light, even when the machine is standing. The light fluctuates all the time, and varies from a flicker to a 50% reduction. I bought the second battery because I thought my old one must be defective to cause this variation in power of light, but the very first time I used the new one it was the same. I thought it was not fully charged, so had it on charge until overcharged at low charging rate, but it still flickers.—D.W.G.

The flickering of your electric light must be caused mechanically, and the trouble can no doubt be traced either to a defective lamp-holder or to a fault in the wiring. You should overhaul the system carefully, and replace with new wires if necessary.

Twin Two-stroke Adjustment.

I should be much obliged to you for the following particulars *re* a Scott motor cycle that I bought and have never yet had running. (1.) Does the deflector part of the piston come to the inlet ports? (2.) Is the magneto timing correct, $\frac{3}{32}$in. from top dead centre, with magneto lever fully retarded? (3.) Should a B. and B. carburetter with a variable jet suit the engine? I have just fitted this. (4.) What size hole should be in the nipple that screws into the crank case for lubrication, as one side of the crank case seems to get too much oil?—A.V.C.

(1.) The deflector on the piston head should be at the back nearest the transfer port. (2.) Your magneto timing is too much retarded. Connect the magneto when the fibre heel of the contact-breaker rocker arm is on the centre of the cam segments when the piston is on top dead centre; the control being fully retarded. (3.) You do not state which type of variable jet B. and B. carburetter you have fitted; if it is the one with the variable jet automatically controlled by a needle on the throttle, it can be tuned satisfactorily for your engine. A one lever automatic carburetter would be better, however. (4.) If the crank case on one side receives too much oil, gradually close up the nipple in the oil pipe union until the supply is equalised. It would be better, however, to bring the lubrication system up to date by fitting one of the latest oil pumps with double sight feed.

Overheating.

Could you, in any way, advise me how to stop the overheating which takes place in the cylinder of my 1914 4¼ h.p. outfit? From eight to ten miles are sufficient on either gear to cause such heat that I lose compression and often stop suddenly, as though the engine had seized, but it will start away again with one or two kicks of the starter after I have flooded the carburetter. The cylinder rings and valves are all in good order, and timing seems all right. I have a 36 jet in the carburetter.—J.W.

The overheating of which you complain is no doubt caused by some defect which you will have to trace before it can be cured. In all probability under lubrication is the chief cause, but other troubles having a similar effect are a weak mixture, or ignition too much retarded. Try also the effect of cleaning the carburetter (especially the jet), and also raise the level very slightly.

IMPORTANT DATES.

Jan. 28th to Feb. 5th, 1921—
Scottish Motor Exhibition, Kelvin Hall Glasgow.

Trapping, Warning, and Obstruction.

I should like to know if it is an offence to inform anyone that there is a police "control" in the vicinity, and if it is deemed an offence, could the following arguments be used successfully as a defence? That it is not an offence to advise anyone not to commit an infringement of the laws of the country, but a commendable action? Again if one stopped motorists in the centre of a control and asked them the time, or some other similar question, could one be charged under the Motor Car Act, or any other Act?—H.A.B.

The sole point is, as to whether what is being done is with a view to helping the police or thwarting them. It has been decided that where cars are warned of a police trap and are at that time being driven at an illegal speed the person may be convicted of obstruction, but simply to give drivers of motor cars notice of a police trap was held not to be obstructing the constables in the course of their duty. You will therefore see that you must not warn people who are committing an offence at the time. With regard to the latter part of your letter we should imagine that no offence could be committed if a car is stopped for the purpose stated, but the sole point is as to what is the object of such action.

Effect of Plug Position.

I own a 3½ h.p. o.h.v. N.S.U., and the plug is placed in a recess between the heads of the inlet and exhaust valves, so that the points are in a pocket §in. deep. (1.) Would this make starting difficult? (2.) Would the petrol consumption be lower if the plug were placed in the head of the cylinder, which I had thought of doing by building it up sufficiently to bore and screw? (3.) Is this advisable? (4.) Would it make the machine faster?—C.B.

(1.) It is quite likely that difficult starting may be due in part to the pocketing of the sparking plug. (2.) It is doubtful whether the petrol consumption would be appreciably decreased merely by an alteration in the position of the plug. (3.) An easier solution of the difficulty would be the fitting of a special long reach plug. (These can be obtained from most of the leading plug manufacturers.) (4.) The machine would no doubt be a little faster.

Police Retention of a Machine.

About two months ago I lent my motor cycle to a friend for the day, and as a result of a serious accident was involved in an Assize case. The police inspector took charge of my motor cycle immediately after the accident, and refused to permit me to remove it until the case is finally dealt with, saying it must be produced before the court. Can I take action (1) to compel him to let me have the machine or (2) claim compensation for the loss of the machine?—J.H.

The police are entitled to use their own discretion as to whether they return any property found on a prisoner back to him, or to such other person as he shall direct, or as may be the owner, or they may detain such property if, in their opinion, it will be of any use in the case. Under these circumstances you will have to wait till after the trial, nor can you claim compensation.

A Slipping Clutch.

I have a 1913 3½ h.p. B.S.A. with a free engine clutch, and I should be glad if you would answer the following: When I push the clutch pedal down to free the engine in traffic and come to a standstill, the clutch always slips back and the machine jumps forward. What is the cause?—E.W.J.

The clutch would no doubt remain in the neutral position if you increased the friction on the bearing of the operating pedal; you could do this by fitting a spring washer behind the nut which secures it on its spindle, so that the pedal itself works stiffly.

Two-stroke v. Flat Twin.

(1.) In what respect does a 2¾ h.p. flat twin compare with a 2¾ h.p. two-stroke as regards balance, freedom from vibration, power and liability to carbonisation? (2.) Why does a single require more frequent decarbonising than a flat twin? (3.) Are the valves in a flat twin subjected to the same amount of work and heat as a single? Also is there any valve made of unbreakable steel? (4.) Has a flat twin more power on hills than a single, and is it as reliable?—B.S.

(1.) The horizontal twin engines are most perfectly balanced, and are particularly free from vibration. Single cylinder two-strokes, on the other hand, owing to the rather heavy piston, are somewhat difficult to balance properly, and the vibration is more noticeable than in other types. Probably the latter machine is a little more powerful for its size, but it certainly may need more frequent decarbonisation. (2.) This is chiefly due to over lubrication. (3.) This question cannot be answered without full details of the designs which are being compared. Valves made of stainless steel are practically unbreakable, but these are very difficult to obtain. (4.) The two types are about equally reliable, although the single may be slightly more powerful.

A Damaged Hub Gear.

My machine is a 6 h.p. Roc (about 1911). The gears jumped occasionally, so I dismantled the hub from the back forks, but during the process three small balls fell out. On putting the gear together I could find no place for them, as the three ball races were all right. I packed the gear up without them and all went well for about two miles, when I stopped for petrol. On starting up again all was well in free, but when I tried to engage the low gear, there was a grinding crash, and the belt broke. I took off the gear again and found most of the teeth broken off the three small pinions. I have had three others made and would be thankful for your advice before I try to put the gear together again, as I'm afraid the same thing may happen again.—T.F.

We are not at all clear as to the advice which you require, and from the details you give we are unable to tell you definitely what caused the trouble. Provided the three new pinions are correctly made, and that the rest of the gear is properly assembled, you should not have any further trouble with it, although it would be as well to examine all parts which are likely to come loose. Presumably, the damage was done by some stray part getting amongst the gear-wheels. It is quite likely, of course, that some of the ball bearings from the hub got amongst the gears, and a broken ball race might allow this to happen.

READERS' REPLIES.

A Starting Difficulty.

Regarding "E.N.E.'s" query of the 28th ult., I have had the same experience with my 3½ h.p. P. and M. (R.A.F. model). I have been able to overcome this difficulty, however, in the following manner: After priming the engine, and bringing the decompressor into action, advance the ignition, and then place the hand tightly over the wire gauze air inlet of the carburetter—mine is a B. and B.—while depressing the kick-starter. Even this method requires some "knack," but I find it impossible to use the kick-starter without doing this.—F. Hugh Worters.

Contact Breaker Troubles.

Re W.P.'s trouble with U.H. magneto points in your issue of October 28th. It may be of use to him to know that in this type of magneto as the central hexagon headed bolt of the contact breaker is the means of adjusting the points it is never really tightened up. A small locking spring is therefore fitted over the bolt head, which, if not in position or missing, would allow the bolt to move and so cause the trouble.—J. Coleman.

EXPERIENCES WANTED.

A.J.C.F. (Littlehampton).—6 h.p. twin B.S.A. outfit; consumption, ease of starting, springing of sidecar and front wheel, reliability, speed on hills.

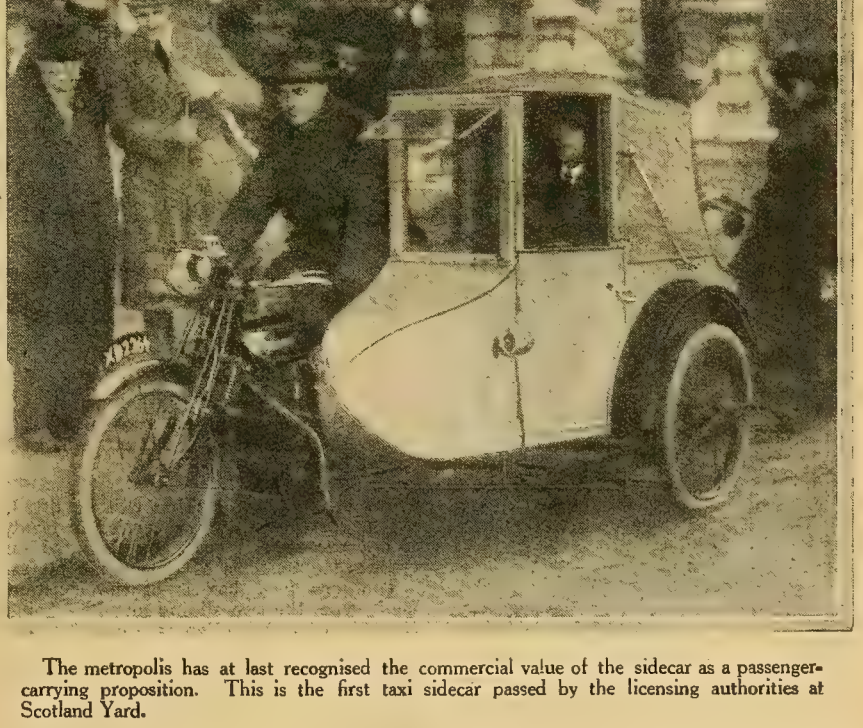
RECOMMENDED ROUTES.

Newport to Hastingleigh.—R.E.

Newport, Chepstow, Gloucester, Cirencester, Faringdon, Wantage, Didcot, Reading, Wokingham, Bracknell, Staines, Kingston, Sutton, Croydon, Westerham, Sevenoaks, Maidstone, Ashford, Hastingleigh.

Birmingham to Borth.—E.J.T.

Erdington, Chester Road for New Oscott, Brownhills, Bridgetown, Four Crosses, Gailey, Ivetsey Bank, Weston, St. Georges, Weklington, Norton, Atcham, Shrewsbury, Bicton Heath, Cardeston, Middletown, Buttington, Welshpool, Garthmyl, Newtown, Llandinam, Llanidloes, Dyffryn, Castell Inn, Pont-erwd, Aberystwyth, Borth.



The metropolis has at last recognised the commercial value of the sidecar as a passenger-carrying proposition. This is the first taxi sidecar passed by the licensing authorities at Scotland Yard.

BG

NEW MODELS.

A Lea-Francis Sidecar Outfit.

Two Three-speed Machines to be shown at Olympia. New Model has 5 h.p. M.A.G. Engine and New Type Gear Box.

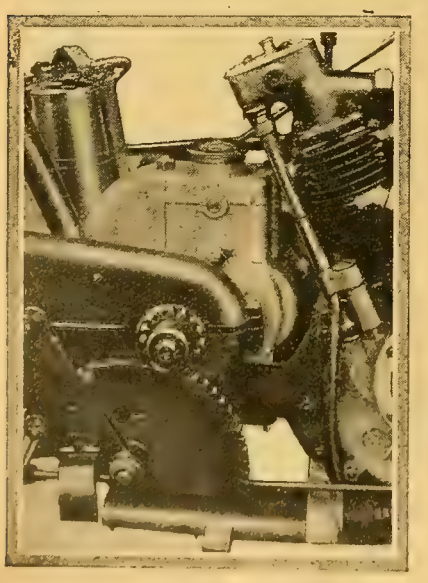
LEA-FRANCIS motor cycles for some time past have been fitted with the 3½ h.p. M.A.G. engine and two-speed countershaft gears. This type has become so well-known and justly popular that it is hardly necessary to give a detailed description.

For 1921 only one outstanding feature has been changed, this alteration being the provision of an additional gear ratio. The new three-speed gear remains housed in the large circular bottom bracket, as was the case with the two-speed—in fact, externally it resembles an earlier type of three-speed box fitted to a few Lea-Francis machines. The details have, however, been redesigned and stiffened up, and the box has successfully withstood long distance road tests.

Smooth Gear Change.

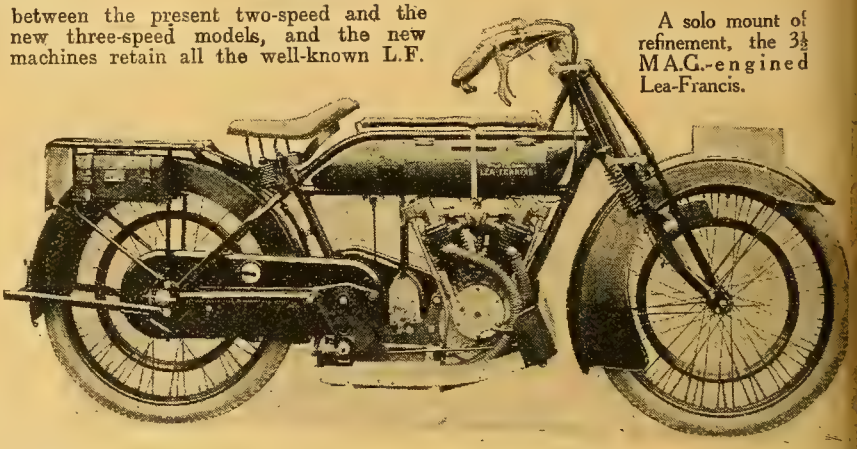
One sliding member only is used, top and bottom ratios being engaged by dogs, while the middle gear wheels are made with heavier pitch teeth, so as to withstand the meshing of the wheels. An excellent feature of the gear is the easy "change," and on an experimental machine without the final "gate" we found that one could slip from top to bottom and bottom to top without noise or jar as the middle gear was passed.

A new carrier and the change-speed gate are the only visible signs of difference between the present two-speed and the new three-speed models, and the new machines retain all the well-known L.F. features, including, of course, a superb finish.



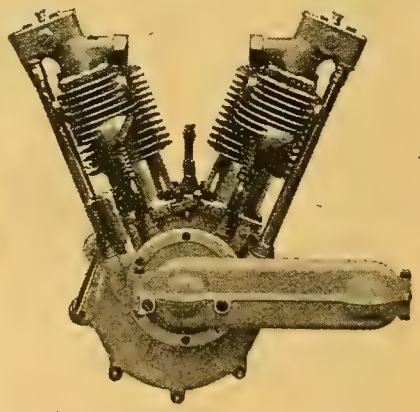
The new three-speed gear box fitted to the 5 h.p. model.

A solo mount of refinement, the 3½ M.A.G.-engined Lea-Francis.



An Enlarged Edition.

Quite a departure has been made by the Lea-Francis Co. in producing a sidecar machine. Although the general features follow the lines of existing L.-F. models,



On the 1921 Lea-Francis 5 h.p. machines this M.A.G. engine of 592 c.c. will be used.

the 5 h.p. M.A.G. engine will be fitted, the magneto or Magdyno carried in front, and a three-speed gear box mounted on rearward extensions of the engine plates.

The new gear box is of the constant mesh type, the two sliding members being controlled by the action of a cam through the medium of two striking forks. All the selecting mechanism is mounted above the box, and the whole is surmounted by a large and accessible oil filler.

A positive adjustment for the chai tension is provided, and as the kick-starte is mounted on the clamping bracket an movement of the gear box leaves the star ing quadrant in correct adjustment.

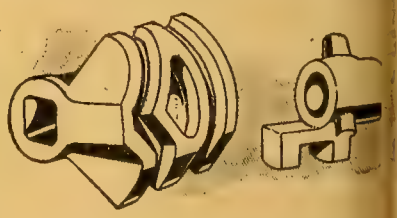
most unusual and desirable feature is th fact that the multiplate clutch is mounte on the engine-shaft, in which position it possible to use either lighter plates o a lighter spring.

Aluminium Chain Cases.

Both the front and rear chain cases ar of cast aluminium and particularly easy t dismount. The rear chain is, of cours brought over to the side remote from th sidecar, and by the use of a speci cranked lug in the rear end of the chai stay, a sound chain case, split horizontall is rendered easy.

It is probable that 26in. × 3in. tyres wi be fitted, and the machine should pro to be admirably adapted to sidecar work

It is yet too early to give details the new Lea Francis sidecar, though w understand that it is to be in keeping wi the motor cycle, and will be attached, course, to lugs incorporated in the fram of the machine.

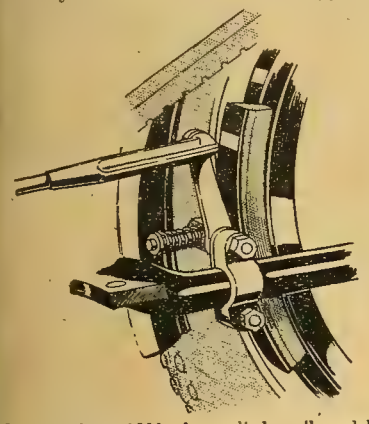


The cam and one of the striking forks of the new Lea-Francis gear box.

A 5-6 h.p. Coventry Eagle for 1921.

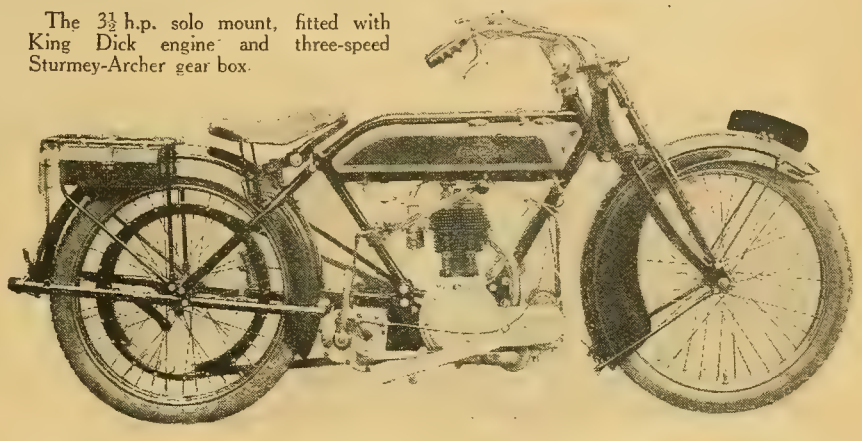
Mediumweight Twin for Solo or Sidecar use. Rigid or Spring Frame at Option.

A REPUTATION for sound work and pleasing appearance has been built up by both the 3½ h.p. and lightweight models of the Coventry Eagle motor cycles. For 1921 a new type has been added to the existing range, and this appears likely to sustain the reputation of this Coventry firm. Fitted with a



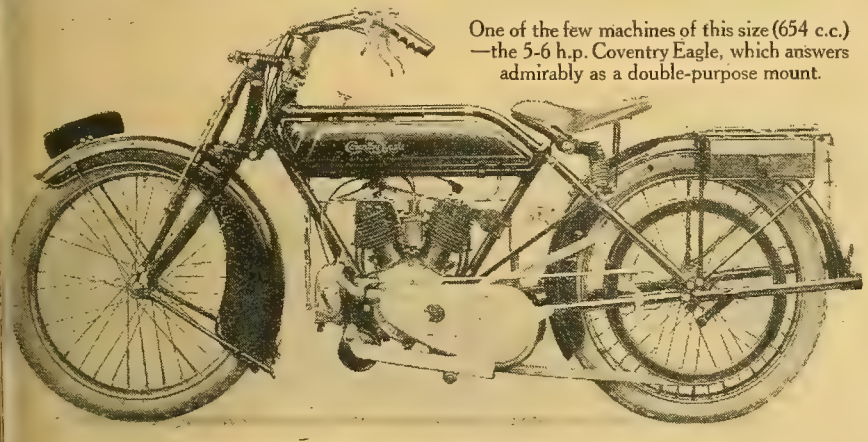
The new internal V brake applied to all models.

The 3½ h.p. solo mount, fitted with King Dick engine and three-speed Sturmey-Archer gear box.



In addition to this, the usual Coventry Eagle belt rim brake has been replaced by a new type acting on the inside of the V, so as not to interfere with the detachability of the wheel. This brake is progressive in action, the lower part of the shoe being arranged to come into engagement with the rim before the remainder of the braking surface which is delayed by the action of a light spring.

Brampton Biflex forks, excellent mudguards, and sensible footboards are included in the specification, and the general appearance is extremely pleasing.

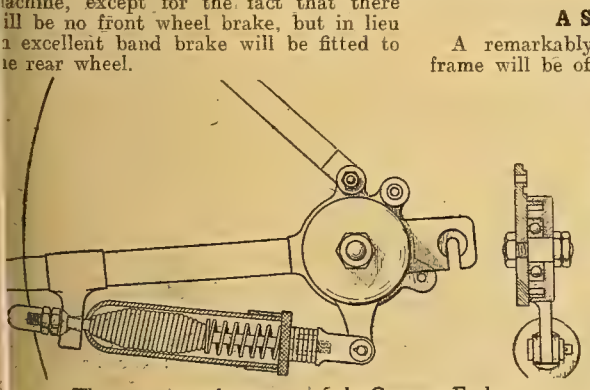


One of the few machines of this size (654 c.c.) —the 5-6 h.p. Coventry Eagle, which answers admirably as a double-purpose mount.

win-cylinder 5-6 h.p. J.A.P. engine of) mm. and 85 mm. bore and stroke reectively, the transmission is by chain nd belt through a three-speed Sturmeyrcher countershaft gear. There are no ery startling innovations on the standard achine, except for the fact that there ill be no front wheel brake, but in lieu a excellent band brake will be fitted to ie rear wheel.

A Spring Frame.

A remarkably simple form of spring frame will be offered as an alternative to the rigid frame on all the larger Coventry Eagle models. Carried on the rear portion of the frame is a pair of substantial bell cranks mounted on ball bearings. The levers carrying the rear wheel normally form extensions to the chain stays, while the remaining levers of the cranks hang downwards in an approximately vertical position.

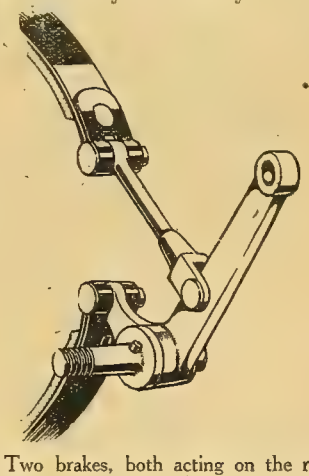


The rear suspension system of the Coventry Eagle.

These vertical levers are attached to an enclosed tension spring anchored at the front to the foremost part of the chain stays, and two "buffer" springs are interposed—one inside the spring case and one outside. One or other of these buffers is always in compression, and, consequently, helps to damp any violent shocks.

Enclosed Pivot Bearings.

It should be pointed out that the ball bearings on which the bell cranks pivot are entirely enclosed and packed with grease to prevent the ingress of water or dust. This spring frame has already undergone extensive road tests, and has proved eminently satisfactory. We are informed that the alteration of belt tension due to the action of the wheel has no appreciable effect either on belt slip or wear, and we are looking forward to a road test at an early opportunity.

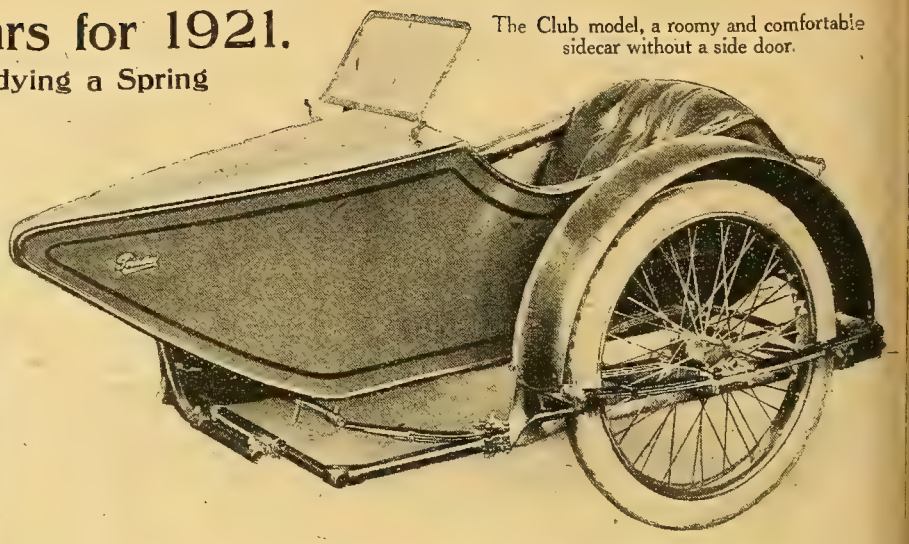


Two brakes, both acting on the rear wheel, are a feature of the new design. The sketch shows the toggle mechanism of the new band brake.

In addition to the 5-6 h.p. model, the manufactures will retain the 3½ h.p. King Dick, 2¾ h.p. J.A.P., and 2½ h.p. Villiers-engined models, which will be fitted with brakes as described above. With these exceptions, only detail alterations have taken place, as existing types have proved so satisfactory.

Grindlay Sidecars for 1921.

Several New Models Embodying a Spring Wheel Chassis.



The Club model, a roomy and comfortable sidecar without a side door.

AMONG the outstanding propositions introduced since the revival of the motor cycle industry at the conclusion of the war, the Grindlay double-sprung sidecar has certainly proved to be one of the most successful. Its spring wheel chassis and cantilever body suspension are now well known among motor cyclists, and it is only necessary to remind our readers that the wheel is carried between two semi-elliptic springs supported at each end on arms extending from the side of the side member of the chassis, the rear ends being shackled. The frame itself is rectangular, and supports, in slides, the rear ends of the cantilever springs upon which the body is carried. These springs are pivoted on the body at their centre, and at the fore end move in slides fixed to the body.

Touring and Sporting Models.

In addition to a model similar to that known this year as the *De Luxe*, the double-sprung chassis is being embodied in two new models. The first of these is a full tourist type with bulbous back containing a large locker. At the fore end upswept quarter-elliptic springs are fitted, which complete a springing equipment suitable for the most exacting of passengers.

The body is roomy, well made and finished, and has a glove locker in the dash. As an extra, a folding child's dickey seat will be fitted in the rear locker.

Another new model embodying the double-sprung chassis has a doorless body on sporting lines, but having a larger amount of room than is usual with this type of attachment. The dash is brought well back, and has a neat adjustable windscreen, which enhances its appearance, and provides extra comfort for the passenger.

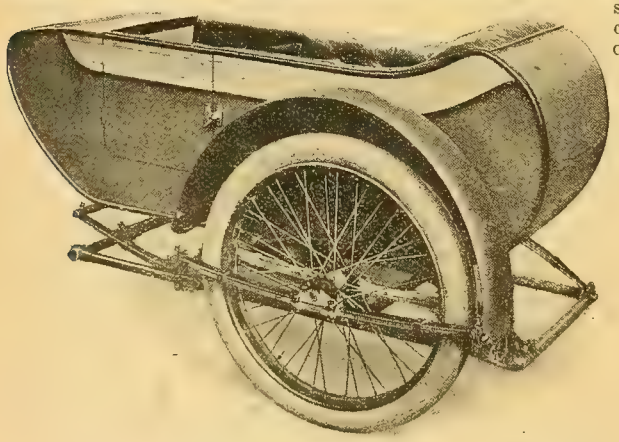
At the rear of the body there is a large locker, upon the lid of which is secured a light grid to carry a spare petrol can.

The third new model is of the pure sporting type—small, light, low, and fitted with a leather hammock seat behind the back rest of which there is a locker of useful capacity. This model has been designed for the larger type of lightweights and the spring frame A.B.C.

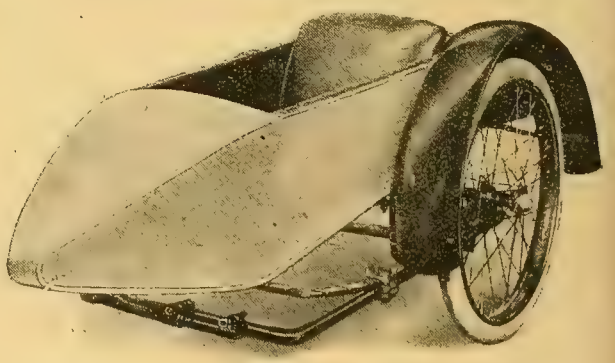
Mudguard Springing with the Body.

In all cases the mudguards are of round section and secured to the body. A full tandem sidecar is also under consideration, and may be completed in time for the firm's exhibit at Olympia.

The makers are Messrs. Grindlay, Ltd., Melbourne Works, Spon End, Coventry.



A new tourist body on the Grindlay spring wheel chassis. The bulbous back can be used as a spacious locker or a child's dickey seat.



A light sporting model fitted with a leather hammock seat. Quarter-elliptic springing fore and aft is adopted on this lightweight chassis.

THE TRIUMPH PROGRAMME FOR 1921.

All Chain and Chain-cum-belt 4 h.p. Models for Solo, Sidecar, and Sidecarrier work.

FOR next year the Triumph Cycle Co., Ltd., will offer seven models of solo and sidecar machines. Only detail alterations have been made; but the frame has been materially strengthened to withstand the additional strain thrown upon it when used with a sidecar. Permanent lugs for the sidecar fittings are incorporated in the frame. A new front guard will be fitted which provides greatly improved protection as compared with the 1920 pattern. The following are the models which will be offered to the public during the year 1921:

MODEL H.—4 h.p., chain-cum-belt transmission, Sturmey-Archer gear, new type front mudguard. Price, £127 10s.

MODEL H.C.—The same machine with Gloria spring wheel sidecar. Price, £182 10s.

MODEL S.D.—4 h.p., all chain transmission, Triumph three-speed gear box, multi-plate clutch running in oil, improved spring forks. Price, £140.

MODEL S.D.C.—The same machine with Gloria spring wheel sidecar. Price, £195.

MODEL H.C. COMMERCIAL.—The chain-cum-belt machine fitted with a box sidecarrier. Price, £173 10s.

MODEL S.D. COMMERCIAL.—The all-chain drive model fitted with a box sidecarrier. Price, £185.

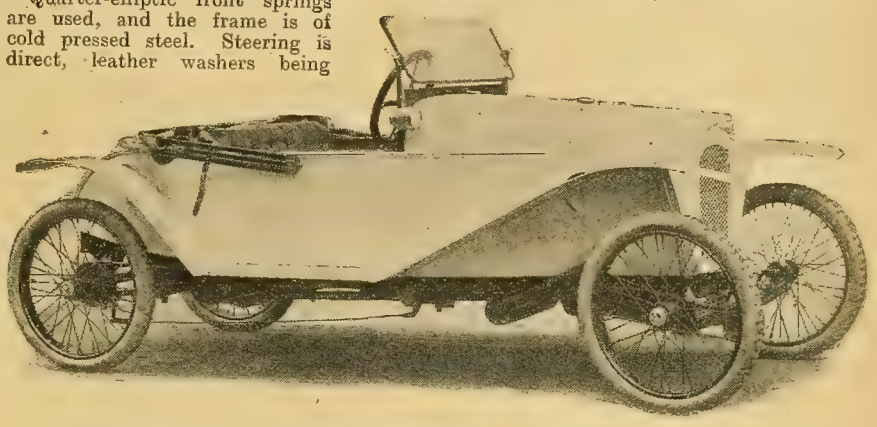
MODEL L.W.—The well-known two-stroke lightweight with all controls, including gear change on the handle-bar. Price, £75.

A Low-priced French Cycle Car.

The Two-cylinder, Anzani-engined, Air-cooled de Marcay; a Light and Simple Four-wheeler.

A FRENCH cycle car of pleasing design, the de Marcay, recently imported into England, should prove of interest to motor cyclists. This little car is propelled by a two-cylinder air-cooled Anzani engine, the bore and stroke of which are 85 mm. and 87 mm. respectively, the capacity being 998 c.c.

The cylinders are of the L head type, the valves being so arranged that the inlet port is directly in line with the centre of the cylinder head, the exhaust port being somewhat offset. The engine is lubricated by drip feed, a practical feature in connection with which is the special two-way oil cock, situated on the dashboard. This enables the oil to be delivered to the working parts, even if the glass case of the visible drip feed is smashed. The engine is arranged across the frame, cooling being assisted by a small four-blade fan mounted on ball bearings in front of each cylinder and driven from the mainshaft by a leather belt.



The de Marcay cycle car—a French production, to be marketed in this country. It has an Anzani air-cooled engine and shaft-drive, and its price will be similar to that of a de luxe sidecar outfit.

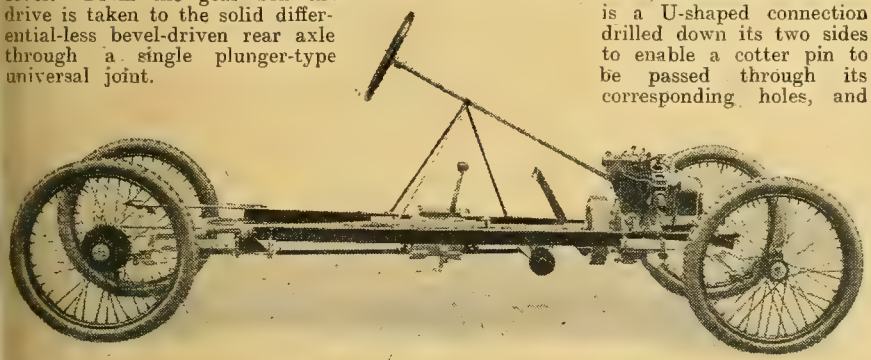
Two Speeds and Shaft Drive.

A Zenith carburetter is used, and for the ignition a high-tension magneto. The drive is taken from the engine through a cone clutch with a self-contained thrust device to a two-speed and reverse gear box, a noticeable feature here being the lid, on the near side of which are notches for the various positions of the gear lever, and on the right those for the brake lever. From the gear box the drive is taken to the solid differential-less bevel-driven rear axle through a single plunger-type universal joint.

Quarter-elliptic front springs are used, and the frame is of cold pressed steel. Steering is direct, leather washers being fitted to the connections to prevent rattling.

Another good feature on the car is the simple braking system and the ease with which it is adjusted. The foot-operated brake acts directly upon the near side wheel, and the hand-operated brake upon the off-side wheel. The connection between the lever and the expanding member, in both cases, is a substantial steel cable, attached to which is a U-shaped connection drilled down its two sides to enable a cotter pin to be passed through its corresponding holes, and through the hole on the lever attached to the expanding shoe, thus enabling an adjustment to be made when wear takes place.

During a short run through the more crowded streets of London we found that the little vehicle was extremely quiet, controllable, and quite comfortable, the leg room provided being more than sufficient.



The chassis of the air-cooled de Marcay cycle car is of particularly clean design and light construction.

Sold with Complete Equipment.

One minor point of criticism which might be levelled at the car is the mudguarding, which does not seem to be quite adequate at the rear, as the tops of the back wheels are only just covered, while the guards themselves appear to be insufficiently supported at the front.

The equipment includes five detachable wire wheels, acetylene side lamps, hood, screen, and a complete set of tools which, by the way, are attached to the back of the seats. It is hoped that the price of the car on the English market will be £260 complete.

The car is handled by the well-known ex-racing motor cyclist, Mr. C. C. Pullin, under the name of de Marcay Cars, England, with premises at 26, Long Acre, London, W.C.1.

UNCONTROLLED AIR INLETS.

IT is a high principle that the rider should have full control over all air inlets, and should rigidly exclude the uninvited guest. It means care, and perhaps trouble; possibly preliminary expense. But it results in a longer life for the wearing parts, economy in fuel and power, and, above all, a truly docile engine at all speeds.

There are only two serious causes of uneven firing. One is uneven sparking, and we are here presuming it non-existent. The other is this *bête-noire* of the conscientious, which is nothing more or less than "atmospheric interference." And, like other forms of interference, it thoroughly annoys the average man.

First, it is due to leaks at the induction pipe or carburetter joints. Easily cured by a spanner, or, if that fails, some packing or a length of homely insulating tape. But far more often the cause is worn inlet valve stems and guides.

Righting a Designer's Omissions.

To begin with, the manufacturer (*i.e.*, his designer) should provide a means of lubricating the valve stems. Incidentally, the present Precision big twin is fitted with simple sleeve-like cups, packed with oil-soaked material, and held in position by the valve springs. Most engines, however, do not have such provision for lubrication at this important point.

A new engine should be fitted immediately on receipt with one or other of the several excellent valve stem lubricating sleeves now on the market, requiring subsequently a drop of thin oil whenever the owner is going round his machine on the weekly overhaul with spanner and oilcan.

What of the second-hand machine with valves already far gone in the guides? If it can be afforded, new valve guides (if not valve gear complete) should be fitted, and the above-mentioned valve stem lubricators added to the inlet guides before taking the road again.

Lightweights.

Next week. The Lightweight Number of *The Motor Cycle*.

Prince Loses his Motor Cycle.

The stealing of motor bicycles is not confined to this country only. The other day H.R.H. Prince Olaf left his machine outside the Theatre Restaurant, Christiania, when it was promptly stolen. It bore the registration mark A.45.

Golf Ball v. Motor Cycle.

The other day we heard of a golf "pro." who was anxious to match a driven ball against a well-known Wolverhampton racing man over a 250 yards course, the latter to take a flying start and the former to strike as the machine was level with the tee. Would the golf ball or the motor-cyclist win?

Reference Issues.

To-morrow's issue of *The Autocar* includes a full illustrated report of the motor car exhibits at Olympia and the White City, to which over forty pages were devoted in last week's issue. The Show issues of *The Autocar*, like those of *The Motor Cycle*, are retained as reference books, and in use throughout the year by all interested in the respective branches of the automobile industry.

The A.C.U. in New South Wales.

An agreement has been completed between the Auto-Cycle Union and the Motor Cycle Club, of New South Wales, by which the latter institution is recognised as the governing body of motor cycling in the State named. The agreement provides for the mutual assurance of many benefits advantageous to motor cycling interests in this country and in New South Wales. The New South Wales Club will have the right to announce its affiliation to the A.C.U., and the English governing body will accord the Overseas Club advice and assistance in the promotion and carrying out of competitions. Members of the New South Wales M.C.C. may display the A.C.U. badge. The bodies will mutually recognise the registration, suspension, and disqualification of licensed competition riders, and the benefits of membership of each body will be mutually enjoyed by members temporarily resident in each other's country.

A Year's Progress in Automobile Design.

In addition to the usual features and a most complete stand-to-stand report of the car exhibits at Olympia and the White City, to-morrow's issue of *The Autocar* contains a comprehensive review of the year's progress in automobile design. Everyone interested in mechanics, whether he be car owner, motor cyclist, or designer of either types of vehicle, will find this survey of the trend of design of great value. The Show Number of *The Autocar* is a really remarkable issue, not only in size but in the quality of its contents.

Petrol Consumption.

Are four-cylinder engines more efficient than those on motor cycles? In a recent fuel consumption test in France, under official observation, a 50×85 mm. four-cylinder Peugeot covered ninety-nine miles on 1.1 gal. of benzole, equalling 90 m.p.g. The little car weighed 1,201 lb., and was equipped with a Zenith carburetter. A two-cylinder car of 1,206 lb. weight, using the same carburetter, only covered forty-six miles to the gallon of petrol, while the two-stroke Major, weighing 1,368 lb., gave 58.1 m.p.g. on petrol, a better performance than many four-stroke cars of approximately the same weight. Our special Continental correspondent reports that elaborate precautions were made against fraud, and that the course was at Le Mans, consisting of a 10½ miles circuit.

Special Features.

ACCUMULATOR LIGHTING FOR SIDECARS.
NEW MODELS.
CYCLE CARS AT THE CAR SHOW.

Where the Miniature Machines are.

It has occasionally been asked where the scooters are, since so few are seen on the road, but during a few days in the environs of Manchester we saw quite a number (of the seat type) evidently being used in the daily business trips of their owners. A traveller was also noticed with a workmanlike equipment of sample cases arranged upon a J.E.S. lightweight. This form of motorised bicycle looked eminently serviceable, and well worthy of greater development.

Preparing for the start of the French fuel consumption test. In the foreground is the two-stroke Major cycle car. On the left is the little Peugeot, the consumption of which worked out at 90 m.p.g. over a distance of ninety-nine miles.

3½ h.p. Lightweight.

Light solo 3½ h.p. machines are now being considered by several manufacturers. Weight reduction has always been urged by *The Motor Cycle*.

Preventing a Misapprehension.

There seems to be a misapprehension regarding the Sopwith firm, which is in voluntary liquidation. We are informed that the liquidators are still supplying A.B.C. motor cycles—now fitted with a kick starter. The repairs department is also in a position to deal with repairs and the supply of spare parts.

A Main Road Trial.

Following upon our recent article on "Trials for Man or Machine?" it is interesting to know that the Sutton Coldfield and N. Birmingham A.C. are organising a closed trial on November 20th to demonstrate how machines have improved since 1912. The course is to be over main roads, and will include Sunrising (not to be confounded with Gamble's Lane, known as Rising Sun, near Cheltenham). Apparently the trial will be on similar lines to Colmore Cup event of 1912, and the organisers appear to be out to show how many machines can succeed in obtaining awards instead of endeavouring to eliminate the majority by the introduction of tests which have little, if any, bearing upon the question of reliability.

Smart Capture.

On Monday morning, October 25th, a representative of Messrs. Cashmore Brothers delivered a 3½ h.p. two-stroke Decto motor bicycle to a customer in East Molesey. This customer complained that the timing was incorrect, and after had been remedied, before settling up for the machine, he asked leave to try . He then disappeared round the nearest corner and was seen no more. After waiting a quarter of an hour Messrs. Cashmore's representative communicated with the police, who acted so quickly that the same evening the prospective purchaser and a companion were caught at Undle, a small village near Northampton, by the village constable. Considering that the police had no indication of the route by which the thief had left town, it speaks well for the wonderful organisation of the force. This exceedingly smart capture should have beneficial effects upon those who think that stealing a motor bicycle is an easy matter.

FIRST WESTERN (A.C.U.) TRIAL.

F. A. Simpson (4 Douglas) who put up the best mileage of the second team (Bristol M.C.C.). He is shown ascending the worst portion of Quarhouse Lane. Note the cross gulley.

Test of Puncture-proofed Tubes.

The R.A.C. recently made a test of inner tubes made by Puncture-proofed Tubes, Ltd. Fitted to a heavy car, which was first required to cover 41.13 miles at 42.5 m.p.h., the tubes were each punctured in from six to eleven places, and the car then covered a similar distance, at the conclusion of which the pressures proved to have lost from 1 lb to 2 lb. per square inch only.

No Reduction of Prices in Sight.

We learn from a reliable source that motor cycle manufacturers trading in this country, both British and American, have been closely considering the general trade outlook, especially as to the possibility of a general reduction in retail prices. The industry is still suffering from the effects of under-production, at a time when the demand was so great. This under-production was accompanied by an increase in direct expenditure on wages and material, and was mainly responsible for an abnormal advance in the ratio of overhead and establishment expenses to output. Under these circumstances it is impossible to foresee any reduction in prices until conditions favour increased and cheaper production, and is accompanied by a fall in price of component parts and raw materials.

News from Advertisements.

£50 reward is being offered by the owner of an A.J.S. sidecar (engine No. 12545, registered DK 2536), which was stolen from outside his residence, "The Gables," Constable Road, Ipswich.

Competitions in Japan.

At the moment of going to press we hear that a British machine—a Triumph—has won the championship of Japan.

The A.C.U. at Olympia.

As in previous years, the Auto Cycle Union has reserved the exclusive use of the Prince's Rooms at Olympia for its members attending the Motor Cycle Show to be held from November 29th to December 4th. In these commodious apartments A.C.U. members may enjoy the advantages of a lounge, facilities for correspondence, a special refreshment service, and reserved cloakrooms. A.C.U. members desiring to use the Prince's Rooms are required to take their membership cards to the Show as a means to admittance.

To Assist Visitors from Overseas.

The services of the British Cycle and Motor Cycle Manufacturers and Traders Union, Ltd., are placed at the disposal of foreign buyers visiting this country. From the 25th November to 7th December enquiries should be made at the offices of the Exhibition Manager, Olympia, and at other times to the offices of the Union, "The Towers," Warwick Road, Coventry. Arrangements are in progress for an "interpreter" service during the show.

The London-Exeter Run.

The Motor Cycling Club has decided to include Peak Hill, Sidmouth, in this year's London-Exeter run. The outward route will be left at Honiton. It is a somewhat stiff hill which will have to be taken in the dark, but it will not be officially observed.

LIGHTWEIGHTS FOR ALL—First Show Number of THE MOTOR CYCLE

Next week's issue of "The Motor Cycle," dated November 18th, will be devoted to Lightweights.

Of great interest to all motor cyclists, and to solo riders particularly, next week's enlarged issue—the first of the four Olympia Show Numbers—will contain much informative matter relating to the lighter types of motor cycles.

Many special articles are in course of preparation including :

LIGHTWEIGHTS AT OLYMPIA. LIGHTWEIGHTS FOR ALL. THE DEVELOPMENT OF THE LIGHTWEIGHT. ROAD TESTS OF NEW MODELS. LIGHTWEIGHTS IN 1920 COMPETITIONS. WHICH TYPE OF MINIATURE—MOTOR CYCLE OR SCOOTER?

An Amazing Trial Result.

Five Teams of Four Riders Fail to Produce a Single Non-stop Performance in the First Western Centre A.C.U. Event.

The first Western Centre A.C.U. Team Trial brought many spectators to the observed hills; the illustration shows C. H. Dickins, (3½ h.p. Dene), of the Cheltenham M.C.C., climbing Quarhouse Lane, near Stroud.

THE Western Centre of the A.C.U. was inaugurated on October 1st, and with praiseworthy promptitude held its first inter-club competition on Saturday last (November 6th).

A short course of 15.8 miles was selected by officials of the Stroud M.C.C., and it included the three hills known as Quarhouse Lane, Bussage, and The Knapp, which were first made known to trials riders in the Redditch open event of 1919 These three hills are very steep, and two of them are crossed by difficult projecting gulleys, but they are eminently fair. Four machines constituted a team, made up of one passenger and three solo mounts.

A Choice of Average Speed.

Three circuits of the course had to be covered, and in view of its difficult nature the competitors were given a choice of speed from 15 to 20 m.p.h.

As events proved, not a single sidecar machine survived the first circuit, while the only soloists who entered the second circuit were four in number, and of these only two carried on to the third circuit, where both met their Waterloo early, one skidding and the other running out of petrol.

Just over a mile from the start (at Stroud) was Quarhouse Lane, the first hill, which accounted for no failures, with the one exception of T. Bailey (3½ Sunbeam), who wobbled and charged the bank. The local riders made excellent performances, their knowledge of the place serving them in good stead; this is specially so of D. Goddard and L. Ratcliffe (4 Triumphs), who undoubtedly put up the finest show of the day

The fun commenced at Bussage, about three miles from the start. Approached by a somewhat loose and muddy lane, the hill ascends steeply and straight for some distance, after which comes a slightly easier stretch, in turn giving place to a few hundred yards of gradient, culminating in a section of quite 1 in 4.

The whole surface of the hill is of a hard, stony nature, and, as it had been covered during the morning with hoar frost, the growing power of the sun converted this into a thin coating of moisture which became a film of slime.

Much of the difficulty of the hill can be appreciated when it is mentioned that riders such as E. Williams (on his o.h.v. 2¾ h.p. A.J.S.) and E. Kickham (on the new chain drive 3½ h.p. Douglas) both came to a standstill on the first circuit with their rear wheels spinning hopelessly. In all, this hill accounted for the entire Stourbridge team, three of the Worcester, two each of the Bristol and Cheltenham, and one of the Stroud team.

Results (maximum team mileage possible, 189.6):

1. STROUD M.C.C.

	Mileage.
L. Blick (7-9 Harley sc.)	2.9
D. Goddard (4 Triumph)	34.5
G. Jellyman (4¼ Juno)	18.7
L Ratcliffe (4 Triumph)	34.4
	90.5

2. BRISTOL M.C.C.

A. King-Smith (7-9 Harley sc.) ...	15.8
P. Grout (4 Douglas)	2.9
E. Kickham (3½ Douglas)	2.9
F. A. Simpson (4 Douglas)	18.7
	40.3

3. WORCESTER M.C.C.

B. Bladder (8 New Imperial sc.) ...	2.9
F. Drew (3½ N.U.T.)	2.9
B. Kershaw (2¾ Verus)	18.7
E. Williams (2¾ A.J.S.)	2.9
	27.4

4. CHELTENHAM M.C.C.

N. Hathaway (8 Sunbeam sc.)	2.9
T. Bailey (3½ Sunbeam)	1.2
C. H. Dickins (3½ Dene)	12.2
L. Painter (3½ Norton)	2.9
	19.2

5. STOURBRIDGE M.C.C.

Reserve rider (8 Enfield sc.)	2.9
F. Barnes (2¾ Marloe)	2.9
R. Fellows (4 Triumph)	2.9
F. Jew (4 Norton)	2.9
	11.6

At the foot of Bussage Hill. L. Ratcliffe (4 h.p. Triumph), who made a fine performance until he ran out of petrol at this point on the last circuit; he was in the winning team. (Stroud M.C.C.)

A Stiff Open Trial in Kent and Surrey.

The Matchless Cup falls to a consistent Single-Cylinder Solo Performance.

A DENSE yellow fog greeted the thirty-six riders who competed in the late autumn trial, organised by the Woolwich, Plumstead and District Motor Club, on Saturday last. The first competitor was scheduled to start at 9 a.m., from the Rose and Crown, Green Street Green, Orpington, and this hour necessitated an early start from London; the dense fog prevailing was the cause of a few late starters.

The competitors had not only to surmount the many difficulties provided by well-known competition hills, but were subjected to a restarting and an acceleration test en route. The latter was carried out at the start, an excellent scheme, as it ensured a good get away. A slight misunderstanding, however, accounted for a few poor results.

W. Brandish (4½ h.p. Humber) made the best performance, and covered the measured distance in 4⅘s., whilst F. G. Edmond (4 h.p. Triumph) took but ⅕s. longer.

Other competitors whose deft handling of the clutch and throttle levers, brought them within the 6s. limit were:

Minnie Grenfell (10 Reading-Standard)	5⅘s.
R. B. Whiffen (8 Blackburne sc.) ..	5⅘s.
A. H. Ilsley (6 Matchless sc.)	5⅘s.
H. O. Hayes (3½ Sunbeam)	5⅘s.
J. T. Bashall (6 Martinsyde sc.).. ..	5⅘s.
H. Green (4 Triumph)	5⅕s.
A. F. Selby (3½ Sunbeam)..	5⅕s.
S. L. Greening (3½ Sunbeam)	5⅘s.

Crossing the Westerham main road, the route lay past Titsey Church, a well-known spot, representative of the beautiful country which abounds on this area, to Tatsfield Green and Polesteeple. This latter provided much excitement, was termed the Colonial section, and proved to be a slippery grass track.

On Whitecross Hill. C. Crosthwaite (James sc) negotiating the steep portion of the hill.

A sharp turn left and the grass path narrowed into a stony track which led up to the famous Crown Ash (Salt Box) hill.

A rough stony surface characterised this ascent, and covered with sodden copper-coloured leaves, which gave no indication of the state of the road beneath, it proved too great an obstacle for many riders. The sidecars were, of course, the victims of wheel spin, whilst the solo enthusiasts found difficulty in negotiating the loose boulders.

A sharp turn to the right at the summit led to Cudham Church and thence to Brasted Hill, on the steepest part of which the restarting test was imposed.

The best time figure was recorded against A. F. Selby (3½ Sunbeam), whilst Minnie Grenfell (10 Reading-Standard) also displayed clever clutch handling. This heavy solo mount was, however, too much for her, and she, with it, crashed to the ground. H. F. Edwards (3½ B.S.A.), who had ridden consistently and well throughout the trial, also made a creditable performance.

The route thence included a stiff ascent, Whitecross Hill, to the slimy surface of which more riders succumbed. Then came a cross route to the lunch stop at Knockholt.

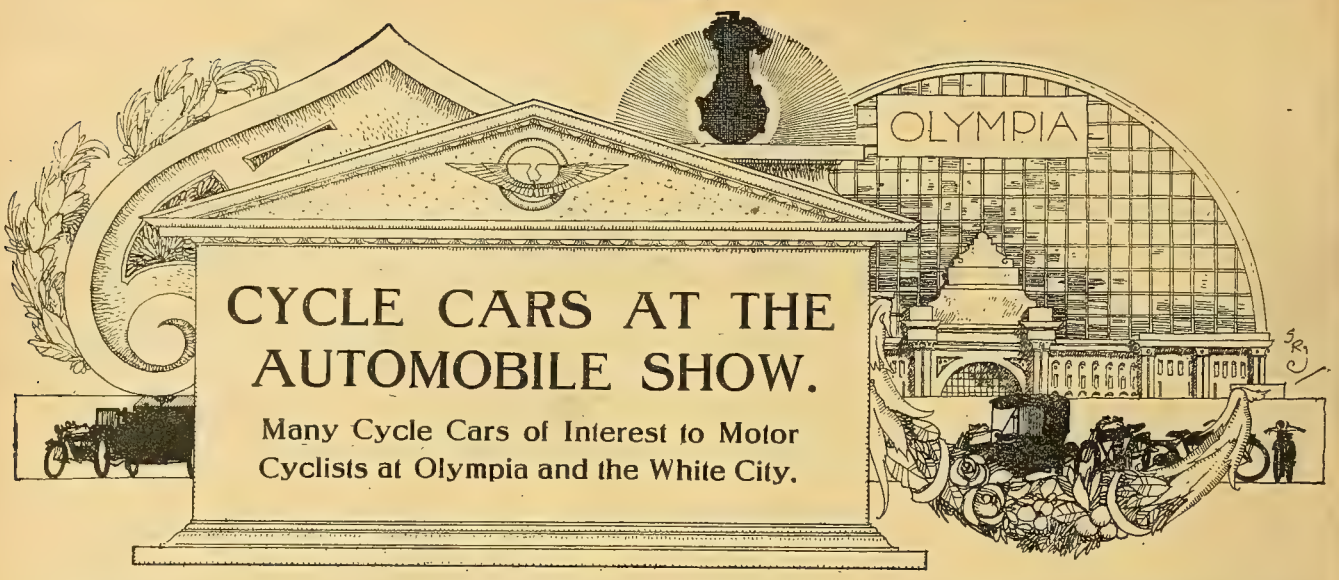
Since ten riders had retired, twenty-six machines only faced the starter at 2.30. Returning to Crown Ash (Salt Box) hill, a good climb was again made by H. F. Edwards (B.S.A.), whilst Baxter, riding his little Radco (the low gear of which, when the throttle was fully open, propelled the machine so slowly that balancing was difficult), also climbed well. Many more stops during the afternoon reduced the eligible riders to a very small number, and at the finish, there was one rider only, H. F. Edwards (B.S.A.), who retained sufficient marks to enable the officiating secretary, Mr. F. J. Ellis, to announce the winner of the premier award. The results are as follows:

MATCHLESS CUP AND GOLD MEDAL.—H. F. Edwards (3½ B.S.A.).

GOLD MEDALS.—Mrs. Hardee (8 Matchless sc.); R. H. Baxter (2½ Radco); B. Walker (3½ Rover); A. F. Selby (3½ Sunbeam); C. Greening (3½ Sunbeam).

SILVER MEDALS.—C. Bourlet (3½ Ariel sc.); H. Bashall (6 Martinsyde); A. H. Ilsley (8 Matchless sc.); W. C. Hemy (6 A.J.S.); J. Wainwright (6 Matchless).

Midst the falling leaves. A few spectators watched the competitors on Yorks Hill. Here is shown J. Wainwright (Matchless sc.) on this typical Kentish byway.



CYCLE CARS AT THE AUTOMOBILE SHOW.

Many Cycle Cars of Interest to Motor Cyclists at Olympia and the White City.

AMONGST a maze of large and expensive automobiles, there are staged at Olympia and the White City several small machines which are of interest to motor cyclists. They are sold, in some cases, at prices lower than many sidecar outfits, and include features which have been developed from successful motor cycle practice.

Unfortunately, these little machines are not all staged in one building, and the prospective purchaser must search Olympia and two halls of the White City before making a considered decision, and even then he will have missed the Carden, the lowest priced, and one of the most interesting exhibits, which is in a third hall of the White City amongst the coachbuilders' exhibits. Accessories also are divided between the two buildings, though tyres are grouped in one hall, and are the first things to be seen on entering the White City.

There is, undoubtedly, a serious effort being made to cope with the demand for a four-wheeled vehicle, which lies in the intermediate stage between the motor cycle and the light car proper, and it is particularly interesting to see how various manufacturers have tackled the problems attaching to such a production. These methods range from simple and ingenious units attached to a combined frame and body to pressed steel frames, water-cooled engines, three-speed and reverse gear boxes, and complete shaft drives with differential back axle. Indeed, it is a difficult matter to decide where the cycle car ends and the light car proper begins, such excellent little machines as the Douglas and Kingsbury being on the dividing line. Mention must be made of the two-cylinder two-stroke Major, a French production having an engine of about 750 c.c. Friction drive is used; but though the machine forms the nucleus of a promising cycle car, the price is necessarily raised by import duties, etc., to a rather high level. Coachbuilders, as a rule, have not specialised in bodies for the lighter types, but visitors to the Show should not miss the exhibits of Messrs. Grose, Ltd., of Northampton, who are showing, in the Annexe of Olympia, very attractive bodies on G.N. and Rover chassis.

A detailed review of these interesting exhibits follows:

A.V. *Stand 410, Wh. City.*

Designed originally as a monocar, the A.V. has now a larger brother, known as the A.V. Bicar. This machine is propelled by an 8 h.p. J.A.P. engine placed at the extreme rear of the body, and drives the solid rear axle through an epicyclic two-speed gear and chain. The rear axle is held in radius rods, which are attached to quarter-elliptic springs. As the engine is somewhat shielded from draught, a blower, driven from the timing side of the engine, is arranged to force air past the cylinders. This short description is sufficient to convey the salient features of one of the simplest forms of drive which has yet been produced. The two-seated body, with staggered seats, forms the frame, and the front axle is centrally pivoted and suspended on a combination of coil and quarter-elliptic springs. Naturally the monocar has not been dropped, but the description of the bicar stands in this case, except for the seating arrangements and the fact that either the 5, 6, or 8 h.p. J.A.P. engines may be fitted. Prices: Monocar, 5 h.p. £171, 6 h.p. £179; 8 h.p. £185; Bicar, £235.

BLERIOT WHIPPET.

Stand 37, Olympia.

But few alterations have taken place in this simple chassis since it was last described in these pages. An 8 h.p. air-cooled Blackburne engine provides the power unit, and incorporated in the flywheel is a single plate clutch. The friction surfaces of this clutch are composed of a series of circular Ferodo inserts, which take the place of the more usual cork inserts. One of the advantages of this plan is that even an amateur is capable of replacing the inserts in the case of wear. We are told, moreover, that a very smooth but efficient drive is afforded. Transmission is by chain to an expanding pulley mounted on a countershaft, the whole countershaft swinging to maintain belt tension as the pulley expands. A jockey sprocket is used to take up chain slack.

In the latest models Hoffmann ball thrust races are fitted to the pulley gear, and the countershaft is splined instead of keyed. The chassis is of wood, and quarter-elliptic springs are fitted front and back. An interesting hand starter is used, and the engine can be rotated from the driver's seat by means of a long lever, carried outside the body, and connected to a toothed quadrant meshing with a pinion on the crankshaft. The ground clearance has been somewhat increased in the latest type. Fitted with hood, screen, and a body of comfortable width, the Bleriot Whippet sells at £250.

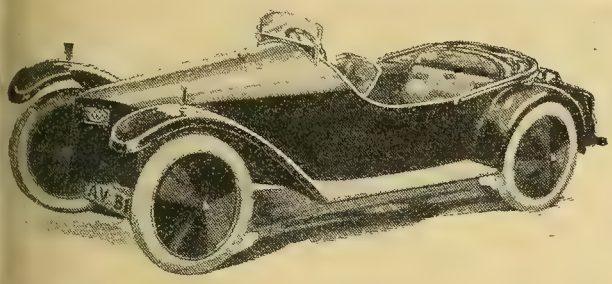
CARDEN. *Stand 476, Wh. City.*

Undoubtedly one of the centres of attraction is the new Carden. For years the £100 car has been an object which manufacturers have striven to attain, and yet this desirable object has been achieved in 1920 in spite of the high prices now ruling.

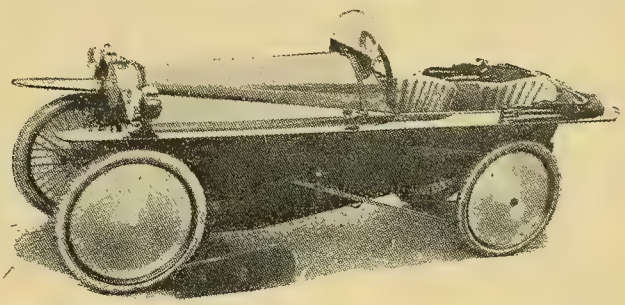
How is it done? By clever design and the elimination of the unnecessary! The whole power unit, both engine, gears and mechanical lubrication are combined with the rear axle, and this unit can be en-

EXAMPLES OF FOUR-WHEELED CYCLE CARS OF INTEREST TO MOTOR CYCLISTS.

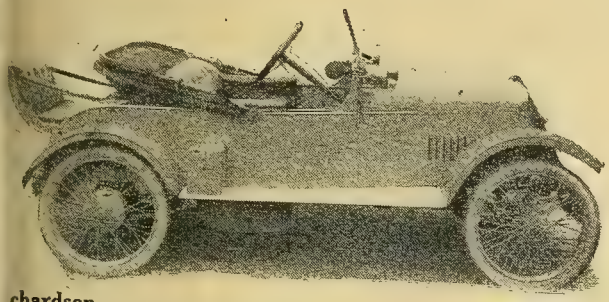
Air-cooled V and Flat Twin Engines Predominant in 1921 Cycle Car Design.



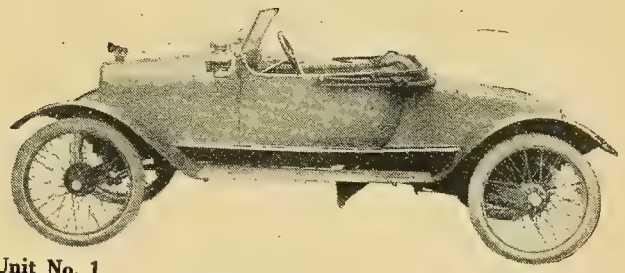
A.V. Bicar. **£235 0 0**
8 h.p. air-cooled twin J.A.P. engine, epicyclic two-speed gear, chain transmission.



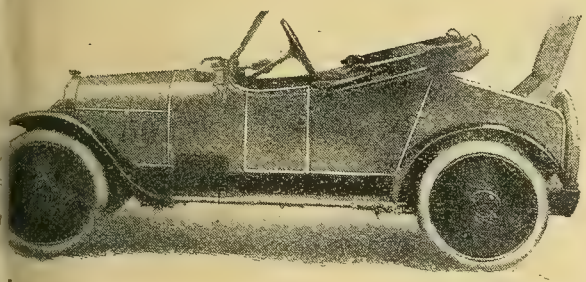
Tamplin. **£165 0 0**
8 h.p. air-cooled J.A.P. engine, Sturmey-Archer three-speed gear, chain-cum-belt transmission.



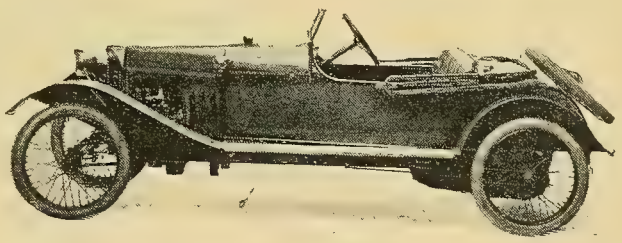
chardson. **£262 10 0**
8 h.p. J.A.P. or 10 h.p. Precision air-cooled engines, friction and chain transmission.



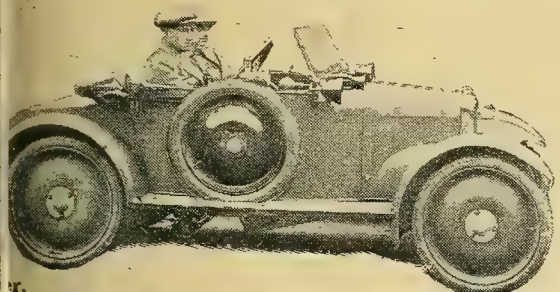
Unit No. 1. **£275 0 0**
8 h.p. air-cooled flat-twin engine, friction and chain transmission.



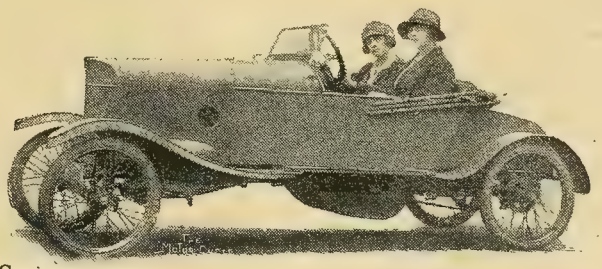
l. **£285 0 0**
8 h.p. water-cooled J.A.P. engine, three speeds and reverse, chain transmission.



G.N. **£241 17 6**
10 h.p. air-cooled twin engine, shaft-cum-chain transmission, three-speeds and reverse.



er. **£300 0 0**
h.p. air-cooled flat-twin engine, shaft transmission, worm drive rear axle.



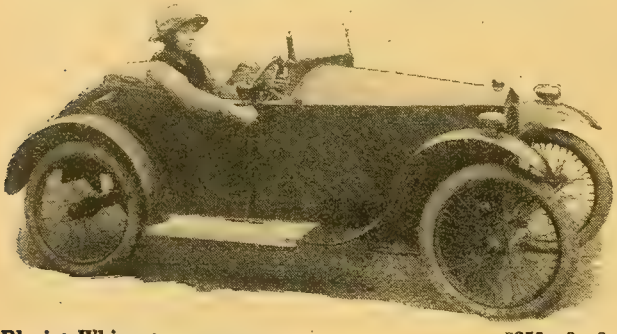
Grahame White. **£245 0 0**
5-6 h.p. wa[illegible]-cooled flat twin Coventry-Victor engine, friction and chain transmission.

tirely removed in a very short space of time.

One cannot expect luxuries at the price, and yet all that is possible has been done in this direction. A two-cylinder air-cooled two-stroke engine of 75×80 mm. bore and stroke drives a two-speed gear through a large gear wheel meshing with a small pinion on the crankshaft, the driven shaft forming part of the rear axle. A five-plate clutch is interposed, and, in spite of the low price, a two-cylinder combined plunger and oscillating oil pump running at 1-256th engine speed forces fresh oil to the pistons. Roller big ends are employed, and the whole unit is insulated from the body by coil springs.

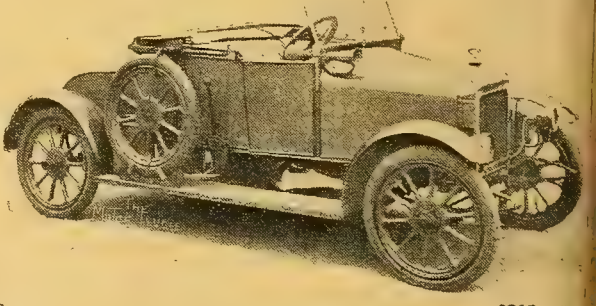
Since the unit is combined with the rear axle, no frame is required, and the body serves a double purpose. The front axle, also, is suspended on coil springs, and the machine has a very presentable appearance. 26×2¼ tyres are fitted, and hood and screen are listed as extras. It should be added that a simple kick-starter, operated from the driver's seat, is included in the specification. We hope later to deal more fully with this interesting design, which permits a practicable two-seater being produced at a price which is little in excess of that of a lightweight motor cycle.

Incidentally, we noticed that the Carden exhibited was fully equipped with very smart accessories supplied by Messrs. Gratze.



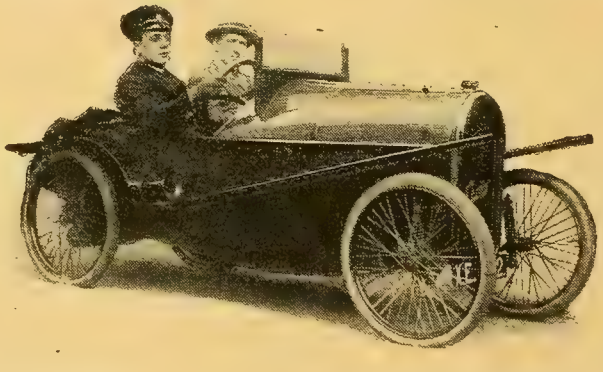
Bleriot-Whippet. **£250 0 0**

8 h.p. air-cooled twin Blackburne engine, variable gear, by expanding pulleys, chain and belt transmission.



Crouch. **£315 0**

8 h.p. water-cooled twin engine, epicyclic three-speed and reverse gear, chain transmission.



Carden. **£100**

8 h.p. air-cooled two-cylinder two-stroke engine. gear drive to live back axle.

CROUCH. *Stand 439, Wh. City.*

Engined with a water-cooled 60° V twin, the Crouch combines a unit engine and gear box set across the frame, with a final chain drive—a combination which, though unusual, has proved eminently satisfactory on road and track. In the latter connection, it will be remembered that this little car recently averaged 62 m.p.h. for three hours on Brooklands, and lapped at 68 m.p.h. for some time. A three-speed and reverse gear is provided, and the unit is slung from a channel steel frame.

Suspension differs from the usual cycle car practice, in that full elliptic springs are used in front. Rack and pinion steering is employed, and the starting handle is geared up. Since the engine lies behind the seats and the radiator is in front of the car in a normal position, a simple gear type water pump is used to ensure adequate water circulation. The wheels are detachable and interchangeable, and are of the artillery type, while a fifth wheel is included in the specification. 650×65 mm. tyres are fitted. Price, 300 guineas.

G.N. *Stand 425, Wh. City.*

One of the earliest true cycle cars which has survived the test of time, and has increased considerably in popularity, is the G.N. Peculiar interest attaches to this make since Capt. Nash set up the wonderful speed record of 87.5 m.p.h. on his racing machine Kim II. This machine, with its inclined overhead valves and single-seated racing body, forms a centre of attraction on the G.N. stand.

Several types are shown, but, as they differ only in detail, the standard touring machine will serve as a model. An 8 h.p. 90° V twin engine serves as a power plant, and in itself contains many interesting features. The inlet valves are placed directly over the exhaust, the rocker gear being enclosed. An overhung crank with long plain bearings is employed, and a single-plate clutch is combined with the large outside flywheel. Thence power is transmitted by shaft to a bevel-driven countershaft, and, finally, three speeds and reverse are provided by means of four chains and a pair of gear wheels.

The final transmission is protected by an ample shield, and the whole is carried in a simple frame which is constructed of channel steel.

Quarter-elliptic springs are used at the front and rear, and a parallel motion for the axles is ensured by a simple system of tie-rods. Steering is by bevel gear, and internal expanding brakes are used. Price £241 17s. 6d. complete, but £33 15s. extra for dynamo lighting.

GRAHAME-WHITE. *Stand 25, Olympia.*

Two types of runabouts are staged on this stand. The smaller is propelled by a 350 c.c. Precision two-stroke engine, and is the acme of simplicity. A long chain conveys the power to a sprocket gripped to the countershaft by a co insert clutch. Two gear ratios are o tained by the use of chains to the re axle, the front sprockets being locked the countershaft, as desired, by means dog clutches.

Suspension is by quarter-elliptic sprin attached to an ash frame, and, since t rear axle is solid, a contracting bra band is fitted to each rear wheel, c operated by foot and the other by ha The price is £160, or with hood, scre and accumulator lighting, £174.

The larger model is engined with a 5-6 h.p. Coventry Victor flat twin, wh propels the machine by means of sha friction gear, and a short chain to solid axle.

Springing and brake gear are similar design to those on the lighter machi but the frame is constructed of tape pressings arranged with the ribs of channel pointing outwards.

In future models all wheels will detachable and interchangeable. price is £245, or with hood, screen, accumulator lightin, £265.

L.M. *Stand 332, Wh. C*

The L.M. is no newcomer to the c car ranks, and, in essentials, the la type resembles its forerunners. An 8 water-cooled J.A.P. engine with extra l flywheels, is placed in the front of frame, and each cylinder is cooled se ately on the thermo-syphon princip

A chain drives the main shaft solidly constructed three-speed and verse gear box situated amidships, a further chain conveys the power to rear axle. It is very noticeable that

cellent arrangements have been made for the adjustment of these chains, a positive sliding motion being provided for the gear box by a conveniently placed adjusting screw, while the rear axle may be moved bodily in slotted radius rods.

Both internal expanding and external contracting brakes are fitted to each rear wheel, and quarter-elliptic springing is employed throughout, the front springs being assisted by coils between the axle and the frame members. Steering is direct. The price, complete with hood, screen, and accumulator lighting, is £285.

NORTH STAR AND EDMOND. *Stand 471, Wh. City.*

A machine is shown having a 4 h.p. Blackburne engine, chain drive to a countershaft, and final belt drive through a special Grado gear. The frame is of the buckboard type, but quarter-elliptic springs are added.

RICHARDSON. *Stand 408, Wh. City.*

Amongst the cycle cars which have been in evidence in many competitions during the year is the 8 h.p. Richardson. The layout is particularly simple, and, briefly, it may be described as having an 8 h.p. J.A.P. or 10 h.p. Precision engine, driving through shaft, friction gear, and chain to a solid rear axle. The engine and transmission are mounted in a combined wood and steel frame, and the buckboard type, but quarter-elliptic springs.

Since the rear axle is solid, the brakes—one on each wheel—are operated one by hand and the other by foot; each is of the internally expanding type. The starting handle is geared up so that the engine may be "swung." The driven gear is of compressed cork. The standard equipment includes 650×65 mm. Dunlop tyres, hood, screen, and accumulator lighting. In addition to this a dickey seat is part and parcel of the neat bodywork. Price, complete, £262 10s.

ROVER. *Stand 57, Olympia.*

One of the most popular light machines on the road is the 8 h.p. Rover, which has already done much to allay the public prejudice against air-cooling, since the silence and reliability of its 85×88 mm. flat twin engine have been proved.

There is nothing startling in the design, which is a sensible straightforward proposition throughout. Cast iron cylinders with detachable heads and side-by-side valves, mechanical oil pump feeding into the base of one cylinder through a sight feed, and roller bearing big ends are the main features of the engine.

Transmission, which is purely on car lines, is through a three-speed and reverse gear box and propeller-shaft to a worm-driven rear axle. Quarter-elliptic springs are bolted to the channel steel frame, and Sankey steel wheels are used as standard.

Another 2in. of leg room has been provided in the body, and the spare wheel has been brought round to the side of the body, so as to leave more room for spares and luggage in the boot. Electric lighting is a standard fitting, and the complete car sells at £300.

TAMPLIN. *Stand 433, Wh. City.*

Amongst the lower priced two-seaters the Tamplin holds a high position. Its transmission follows motor cycle lines, closer perhaps than that of any other cycle car. An 8 h.p. J.A.P. engine drives a Sturmey-Archer gear box by means of a primary chain, and thence a long belt running over large pulleys is used to drive the solid rear axles. The actual drive is outside the body in an accessible position, but the engine, gear box, and kick-starter are inside and well protected from the elements.

Properly speaking, there is no chassis, since the body, suitably stiffened, forms the frame. Coil springs in front and quarter-elliptics at the back provide adequate suspension, and all springs are adjustable for the weight carried. By climbing the worst of the Midlands' and Southern Counties' hills, the Tamplin has proved its capabilities, and with its deeply staggered seats it has a sporting, though unusual appearance. Price £165.

UNIT NO. 1. *Stand 333, Wh. City.*

One of the most interesting exhibits in the Show is the Unit No. 1, which may be said to consist of two parts, (1) a front axle, ash and flitch plate frame, and an ingenious cable rack steering gear easily and instantly adjustable, and (2) a rear axle, friction gear, and engine unit carried on a steel frame, attached to No. 1 by quarter-elliptic springs, and a flexible connection placed amidships. The engine is an air-cooled Bovier flat twin of 85×88 mm. bore and stroke respectively, having steel cylinders, cast iron detachable heads, with side-by-side valves and an ingenious system of forced lubrication, by which oil is fed to a well above the tappets and distributed to the cylinders by the tappets themselves.

Behind the engine lies a simple friction gear, consisting of a driving disc fitted with four blades on its outer periphery, and a driven disc behind a large cork disc held between two plates. This cork is easily and quickly replaced in case of need.

The driving disc may be moved by a quick thread screw in order to provide a clutch, and an extra tension device is supplied for emergencies.

The countershaft is provided with a gear reduction to avoid the necessity of large sprockets, and a short chain is used for the final drive. Both brakes are carried on the axleshaft, and it should be mentioned that the weight is taken by extension of the sub-frame so that the axle transmits power only. This unit lies, of course, behind the occupants of the car. The seats are of the hammock type, carefully padded, and a large locker is placed behind the dummy radiator. The price complete is £275, and a water-cooled model can be supplied at £297.

RECORDS AT BROOKLANDS.

ON Thursday, the 4th inst., several new records were created at Brooklands by H. Le Vack on an Indian, and also by Capt. M. C. Breese on a Coulson B.

Le Vack's times in the Class E records were as follows:

miles	39m. 33s.	...	75.85 m.p.h.
miles	1h. 23m. 8⅘s.	...	72.17 m.p.h.
miles	2h. 2m. 28⅘s.	...	73.48 m.p.h.
miles	2h. 45m. 5⅕s.	...	72.69 m.p.h.
hour	73 ml. 1,229 yd.	...	73.69 m.p.h.
hours	146 ml. 1,514 yd.	...	73.47 m.p.h.
hours	218 ml. 697 yd.	...	72.79 m.p.h.

Between the 50 and 100 miles, Le Vack had a broken chain, which accounts for the slower speed accomplished in the 100 miles. After riding for three hours, he had to stop on account of the fog.

The machine used for these records was a standard Indian Powerplus model, 1,100 mm. (997 c.c.). The equipment of the machine consisted of Dunlop tyres, Lucas magneto, Renolds chain, Wakefield's Castrol, and K.L.G. plugs.

On the same day, Capt. Maurice Breese gained seven Class F records, his times and speeds being as follows:

50 miles	1h. 13m. 14⅘s.	...	40.95 m.p.h.
150 miles	3h. 51m. 18⅘s.	...	38.89 m.p.h.
200 miles	5h. 11m. 31⅘s.	...	38.52 m.p.h.
2 hours	79 ml. 441 yd.	...	39.62 m.p.h.
4 hours	154 ml. 1,596 yd.	...	38.72 m.p.h.
5 hours	192 ml. 549 yd.	...	38.45 m.p.h.
6 hours	230 ml. 245 yd.	...	38.35 m.p.h.

The equipment of the machine consisted of Flexi carburetter, E.I.C. magneto, Wood-Milne tyres, John Bull belt, Wakefield's oil, and Shell Aviation spirit.

The previous best performances were Class E: 50 miles, A. J. Moorhouse (Indian), 40m. 59.2s. (73.11 m.p.h.); 100 miles, J. L. Emerson (A.B.C.), 1h. 26m. 13.6s. (69.58 m.p.h.); 150 miles, A. J. Moorhouse (Indian), 2h. 16m. 18s. (66.03 m.p.h.); 200 miles, A. J. Moorhouse (Indian), 3h. 1m. 54.4s. (65.96 m.p.h.); 1 hour, V. E. Horsman (Norton), 71 ml. 1,173 yd. (71.84 m.p.h.); 2 hours, V. E. Horsman (Norton), 138 ml. 1,258 yd. (69.36 m.p.h.); 3 hours, A. J. Moorhouse (Indian), 197 ml. 1,271 yd. (65.90 m.p.h.)

The previous best figures in Class F were as follows 50 miles, Capt. M. C. Breese (Coulson-B.), 1h. 14m. 30s. (40.26 m.p.h.); 2 hours, Capt. M. C. Breese (Coulson-B.), 79 ml. 122 yd. (39.53 m.p.h.)

FUEL AND TAXES.

EVIDENCE of the unpopularity of the new taxes which come into force on January 1st is contained in copies of the correspondence between one of our readers and Sir Henry P. Maybury, K.C.M.G., C.B., Ministry of Transport. The motor cyclist in question, Mr. H. V. P. Smith, of Wood Green, N., in letters dated from April until October, has well presented the case of the average motor cyclist in making a plea for a tax on fuel, but his efforts have brought no better results than those of our motoring organisations, ourselves, and the Motor Legislation Committee. On this point the Government has been adamant all along, and the new taxes were based on recommendations considered as the best alternative to a fuel tax.

EX-D.R. REUNION.

DURING Show week ex-despatch riders of the Third Army Headquarters Signal Company, R.E., are holding their second annual dinner at the Florence Restaurant, Rupert Street, W. December 3rd has been fixed as the date, and any D.R. who was at any time attached to the Third Army in France, and has not received an invitation, is invited to communicate with Cyril F. Earl, 3, Kildowan Road, Goodmayes, Essex.

CLUB NEWS.

Doncaster and District M.C.

The Motor Cycle Motor Cup has been won this season by Mr. F. Leach.

Ilkeston and District M.C.C.

The closing run was held on October 31st. About seventy-five members met at headquarters at ten o'clock and journeyed to Sheffield, where an excellent dinner was provided. The members returned by Worksop and Mansfield to Chesterfield for tea, arriving back at headquarters about 7.15 p.m.

Market Harborough and District M.C.C.

The first competitive event organised by the Market Harborough and District Motor Cycle Club took place on October 31st, when a timed club hill-climb was held on Slawston Hill, near Harborough. A good entry was received, and the first and second prizes were won (on formula) by J. Addison (6 James) and R. Corbett (3½ Sunbeam). The club has already held several social runs, and now numbers nearly fifty members.

Wimbledon M.C.C.

A cordial invitation is extended to motor cyclists and light car owners residing in Wimbledon and district to become members of the above club, which has been in existence over eight years. The Committee are arranging an attractive programme for 1921, and they would be pleased to receive applications from intending members as early as possible, so that preliminary arrangements can be decided upon. Further particulars can be obtained from the hon. sec., 48, Princes Road, Wimbledon, S.W.19.

North London M.C.C.

In accordance with club rules, the officers for the past season resigned *en bloc* at the recent annual dinner at the Holborn Restaurant. The executive for the ensuing season is as follows: President, Mr. Kennedy Jones, M.P.; vice-presidents, Messrs. G. Goffrie Higgs and J. F. Hull; chairman, Mr. G. W. Townsend; captain, Mr. R. W. Greaves; treasurer, Mr. B. Staley; hon. secretary, Lt. Alan W. Day, Lynton, Park Crescent, Finchley, N.3, who will be pleased to welcome new members.

North Wales M.C.C

Although only recently formed, this club is already affiliated to the A.C.U., and has a very strong membership, thanks being due to the energetic president. On October 28th and 30th there was a very successful entry for the petrol consumption test, which was to be won on formula. At the start a pint of petrol was measured out to each competitor and each machine and rider weighed.

The club gold, silver, and bronze medals are awarded the first, second, and third best performances: 1, W. Edwards (2¾ New Imperial); 2, R. M. Johns (2¾ New Imperial); 3, E. Hughes (4 Triumph); 4, Glynne Jones (3½ Lea-Francis).

The last official event of the season is being held on Thursday, November 18th, when a half-day reliability trial will be run. A start will be made from the garage, Denbigh, at 3 p.m., the course being about forty-five miles in length, and will not include any freak hills.

Bradford M.C. and L.C.C.

On Thursday, November 25th, the above club has arranged a very interesting evening. A series of lantern slides will be shown, together with a private view of the Scott Trial films for both 1919 and 1920 (kindly lent by the Scott Co.). The following items in the programme of this live club are a one day trial, Dec. 12th, and the annual dinner, Dec. 17th.

Week-end Club Events.

Nov. 14.—Leicester and District M.C.C. Winter Reliability Trial.
Nov. 14.—Sheffield and Hallamshire M.C.C. Club Trophy Trial.

Leicester and District M.C.C.

The annual winter reliability trial for the Paskell Cup will be held on November 14th. It is a closed event, but would-be entrants who are not members may enter for the trial on payment of 10s. 6d., and they will be made honorary members for one day. The other entry fee for club members is 5s. 6d., and for teams, whether composed of club members or not, one guinea.

The trial will also include an acceleration test on *The Motor Cycle* formula $\frac{C \times T^2}{W}$. The rider who comes out with the best figure of merit in this test will be awarded the Lunt Cup.

Entries close on Thursday, November 11th. Full particulars can be obtained from the hon. sec., Mr. R. A. Spittall, 30, Princess Road, Leicester.

A Yorkshire Centre A.C.U.

The development of motor cycling in Yorkshire has led to the formation of a Yorkshire centre of the A.C.U., subject, of course, to the sanction of the Union being obtained. This means that the Yorkshire Centre will be carved out of the area which has hitherto been covered by the East Midlands Centre. The idea of forming a Yorkshire centre was discussed in an informal way at York last May, but it came up in the form of a definite scheme at a meeting of Yorkshire motor cyclists arranged by the Ilkley Motor Cycle and Light Car Club at Leeds on Saturday, October 30th.

Twelve different Yorkshire clubs were represented. Of these, Ilkley, Keighley, Dewsbury, Bradford, York, Wombwell, Leeds, and Doncaster signified their willingness to join the new centre. The representatives of Harrogate, Scarborough, and Hull Clubs said they had not come with power to join the centre, but would need to report to their respective committees before they could finally commit their clubs. The Sheffield and Hallamshire Club representatives explained that their club was in a somewhat peculiar position. They were on the borderline between the East Midlands Centre and the proposed new centre, and a considerable proportion of their membership was drawn from Derbyshire. In consequence it had been decided to call a special meeting of the members of the club and submit the decision to their vote as soon as possible.

Mr. J. N. Longfield, the president of the Ilkley Club, and an A.C.U. consul, has been temporarily elected president of the new centre, with Mr. F. A. Scriver (Bradford) and Mr. A. Walton (Leeds) vice-presidents, and Mr. F. Dovener as hon. secretary.

Mr. Longfield pointed out that the great advantage of forming such a centre would be that all the clubs in the district would be working together. If the could get such a centre formed many of the grievances which the clubs had against the A.C.U.—and there were always grievances against a ruling body—could be pressed much more effectively.

Scene at the start of the N.M.C.F.U. (Portsmouth Branch) Petrol Consumption Trial. Portsdown Hill was the venue.

Choose the Tread hat Suits the Roads you Ride on.

NO matter what roads you ride on, whether sandy, gravelly, or "clayey," ou can get

Bates

MOTOR CYCLE TYRES

th just the right tread to suit them.

r Sandy or Flinty Roads—

You need a good plain tread, to withstand sharp edges without the necessity for very much "grip."
BATES NO. 1 PATTERN
gives you all the grip you need with a saving of friction which considerably lengthens the life of your tyre. The side ridges prevent skids when "cornering."

Greasy or "Clayey" Roads—

A tread that will bite into the road without skidding or "forward slipping" when climbing hills.
BATES NO. 2 PATTERN
gets a grip on the greasiest road with no undue friction or wear on the tread.

Heavy Combinations—

A tread that will give you the additional "grip" required and yet withstand the extra wear and tear.
BATES ALL-WEATHER PATTERN
Made in 650×65, 3in., for 650×65, 26×3, and 700×80.

Send for Interesting Booklet.

NOW READY *A book that will interest the old-timer, the designer, and all motor cyclists.*

MOTOR CYCLE REMINISCENCES

By "IXION" *of* "The Motor Cycle"

This new book will rank as one of the best things "IXION" has ever done. It not only gives an amusing record of the author's own motor cycling experiences and misadventures, which began nearly twenty years ago, but it contains also a great deal of very interesting motor cycle history, covering, as it does, all the great rides of the early days, from the first End-to-End ride in 1902, and all the important French races.

The writer has drawn upon a well-stocked memory to good purpose, and produced a work which will appeal strongly to all motor cycle enthusiasts. None can read it without laughter, yet under the author's whimsical style there will be found a mass of instructive facts, bringing into sharp relief the wonderful progress that has taken place in motor cycle design.

The book is appropriately illustrated, and in addition to a unique collection of photographic reproductions of early machines, events and rides, it also contains 14 specially prepared drawings of a humorous character.

ANNOUNCEMENT BY BOWDEN WIRE LTD., LONDON.

OLYMPIA STAND 254

POWER and ECONOMY

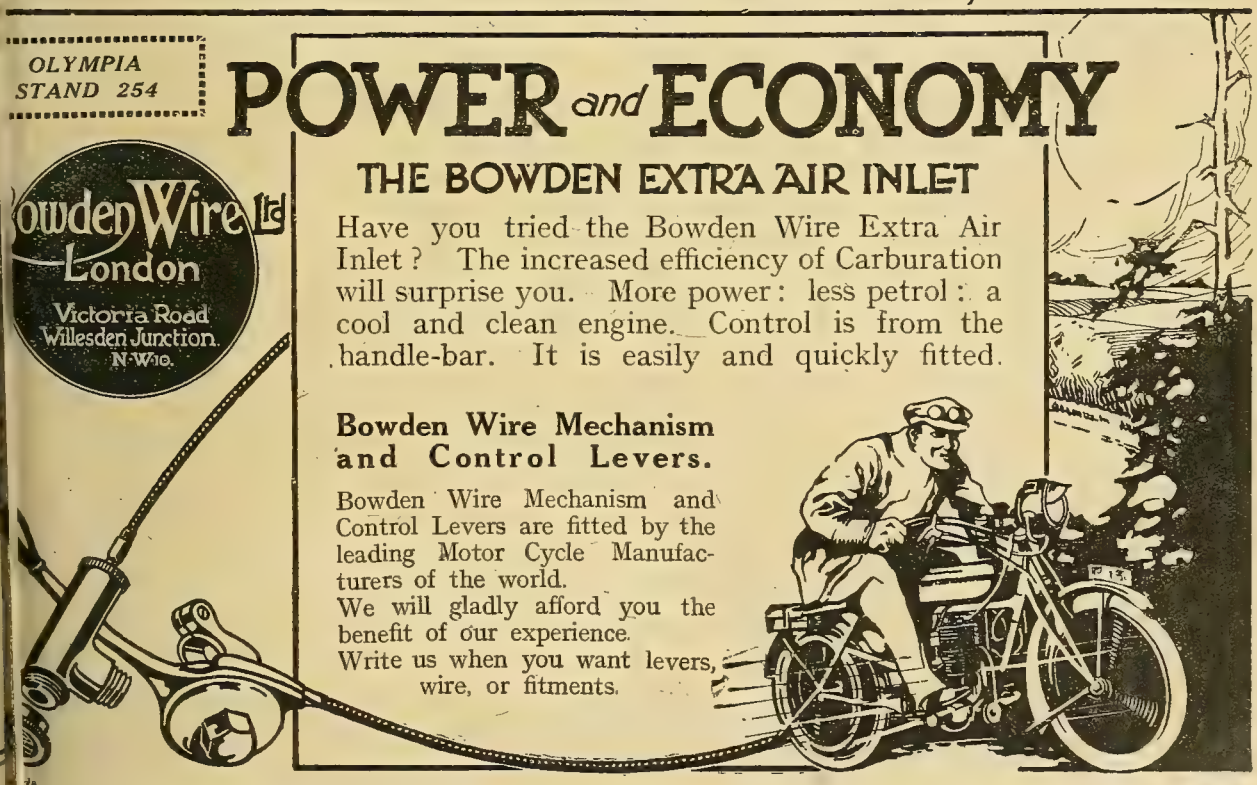
THE BOWDEN EXTRA AIR INLET

Have you tried the Bowden Wire Extra Air Inlet? The increased efficiency of Carburation will surprise you. More power: less petrol: a cool and clean engine. Control is from the handle-bar. It is easily and quickly fitted.

Bowden Wire Ltd London Victoria Road Willesden Junction N.W.10.

Bowden Wire Mechanism and Control Levers.

Bowden Wire Mechanism and Control Levers are fitted by the leading Motor Cycle Manufacturers of the world.
We will gladly afford you the benefit of our experience.
Write us when you want levers, wire, or fitments.



Economical

ENGINE POWER

is provided by

The Quadrupull Belt.

This powerful belt-grip transforms every ounce of engine power into speed because it cannot slip. Look closely at the illustration: these deeply-driven stitches will never come apart, therefore the belt cannot break. In spite of its great strength the "Quadrupull" is easily adjusted and will run on the smallest pulley.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns —First 12 words 3/—, and 3d. for every additional word. Paragraphs of under 8 words are charged double rate. Each paragraph is charged separately. Name and address must be counted. Series discounts, conditions, and special terms to regular trade advertisers will be quoted on application.

Postal Orders and Cheques sent in payment for advertisements should be made payable o ILIFFE & SONS Ltd., and crossed & Co. Treasury Notes, being untraceable if lost in transit, should not be sent as remittances.

All advertisements in this section should be accompanied with remittance, and be addressed o the offices of "The Motor Cycle," 20, Tudor treet, London, E.C.4, or 19, Hertford Street, oventry. To ensure insertion letters should e posted in time to reach the offices of "The lotor Cycle," by the first post on Friday orning previous to the day of issue.

All letters relating to advertisements should ote the number which is printed at the end of ch advertisement, and the date of the issue which it appeared.

The proprietors are not responsible for clerical printers' errors, although every care is taken avoid mistakes.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be ressed to numbers at "The Motor Cycle" Office. en this is desired, the sum of 6d. to defray the cost of istration and to cover postage on replies must be added the advertisement charge, which must include the ds Box ooo, c/o "The Motor Cycle." Only the number appear in the advertisement. All replies should be ressed No. ooo, c/o "Motor Cycle," 20, Tudor Street, .4. *Replies to Box Number advertisements containing illances should be sent by registered post, but in all such s it is advisable to make use of the Deposit System.*

the case of motor cycles offered for sale under a box iber, as it is unusual for these to be sold without first g inspected by the intending purchaser, advertisers will litate business by embodying in their advertisements e mention of the district in which the machine ed may be seen and tried.

DEPOSIT SYSTEM.

rsons who hesitate to send money to unknown persons deal in perfect safety by availing themselves of our sit System. If the money be deposited with "The r Cycle," both parties are advised of this receipt. e time allowed for a decision after receipt of the s is three days, and if a sale is effected we remit the unt to the seller, but, if not, we return the amount e depositor, and each party to the transaction pays ge one way. For all transactions up to £10, a sit fee of 1/- is charged; on transactions over £10 under £50, the fee is 2/6; over £50 and under £75, 5/-; £75 and under £100, 7/6; and on all transactions £100, ¼ %. All deposit matters are dealt with at ldor Street, London, E.C.4, and cheques and money s should be made payable to Iliffe & Sons Limited. e letter "D" at the end of an advertisement is an tion that the advertiser is willing to avail himself of eposit System. Other advertisers may be equally us, but have not advised us to that effect.

SPECIAL NOTE.

eaders who reply to advertisements and receive no r to their enquiries are requested to regard the s as an indication that the goods advertised have y been disposed of. Advertisers often receive so enquiries that it is quite impossible to reply to ne by post.

2¾h.p. 1920 Wooler, 6 speeds, McNab's record breaker; £85.—Wauchope's, 9, Shoe Lane, London. [8593

WHAT Offers for new Wooler twin lightweight, just delivered, cost £103?—Maranatha, York Rd., S.E.27. [7728

WOOLER, 1920, lamps, Cowey horn, quantity of spares, small mileage; bargain, £85.—Coles and Shirley, Chepstow. 'Phone: 48. [0313

1920 Wooler, mileage 395, Smith's trip speedometer, lamps, horn, spare belt, valves, etc.; £95, or best offer.—Windle, Manora, Hollington Park, St. Leonard's. [7908

1920 Wooller, footboards, Cowey horn, speedometer, lamps, 130 m.p.g.; cost £116; perfect, 600 miles; £90 for immediate sale.—159, Victoria Rd., Cambridge. [8272

WOOLER, as makers' specifications, shop-soiled; at greatly reduced price; now is the time to buy.—Mebes, 154-156, Gt. Portland St., W.1. 'Phone: 3426 Mayfair. [7197

1920 Wooler, T.T. model, flat twin, variable gear, as new, all lamps, horn, etc.; £80; exchanges or easy payments.—2, Nightingale Rd., Lower Clapton, London, N.E. [7673

Zenith.

5h.p. Zenith, countershaft model; £55.—Wauchope's, 9, Shoe Lane, London. [8594

DAN GUY, Weymouth.—Sole agent for Zenith motor cycles; early delivery 1921 models. [5965

1920 Zenith 4-5h.p. Sports, fitted cut-out, shop-soiled only, snip; £110.—Dunn, 326, Euston Rd., London. [7703

MOTOR CYCLES FOR SALE.

Zenith.

WAUCHOPE'S, 9, Shoe Lane, London, E.C.4.—4-5h.p. Zenith, 1920, countershaft, clutch and K.S.; £97/10. [8603

1920 Zenith 8h.p., C.S., kick start model, lamps, horn, knee-grips, new; £135.—Dunn, 326, Euston Rd., London. Museum 5391. [8535

1920 Zenith 6h.p. Sports, slightly used for demonstration, as new; 110 gns.—Julian, 84, Broad St., Reading. 'Phone: 1024. [7747

1920 8h.p. Zenith and Henderson De Luxe Sidecar, very little used, fully equipped; £145.—Tuck, 154, Blackhorse Rd., Walthamstow, E.17. [8381

1919 6h.p. Zenith Clutch Combination, Sandum sidecar, kick starter, engine as new, smart turnout; £120; any trial.—Parrott, Oving, Bucks. [7944

ZENITH, 1920, 8h.p., countershaft, smart coachbuilt sidecar, all on, condition as new, very little used; £180.—Brown Bear Hotel, Richmond, Surrey. [7914

ZENITH 8h.p., 1920, Model H, shop-soiled; in stock at greatly reduced price; now is the time to buy.—Mebes, 154-156, Gt. Portland St., W.1. 'Phone: 3426 Mayfair. [7193

ZENITH 8h.p. Sporting Model in stock; £139.—Vivian Hardie and Lane, Ltd., 24, Woodstock St. (off Oxford St.), Bond St., London, W.1. 'Phone: Mayfair 6559. [0319

1920 Zenith 8h.p. Clutch Model, small mileage, complete, speedometer, electric light, spares, perfect; £130.—Victor, Fairmead, Woodside Av., N. Finchley. Tel.: Finchley 2364. [7823

ZENITH 1920 5-6h.p. Twin, sporting model, splendid condition, carefully used, nicely run in, all accessories; £135, no offers.—A.G.B., Amos barber, Ltd., Downham Market, Norfolk. (D) [8297

F.O.C.H. for 1921 Zeniths; very early deliveries; book your order now.—5, Heath St., Hampstead (nr. Hampstead Tube Station). 'Phone: Hampstead 3752. Hours 9-7, including Saturdays. [8039

1920 Zenith, 8h.p., clutch model, Zenith sidecar, Easting, accessories; also Thor 8h.p. combination, very fast; offers; owner going abroad.—Write Capt. Kemp-Small, 64, Paddington St., W.1. [7855

ZENITH 1920 6h.p. Combination, Lucas head, rear, and sidecar lamps, Cowey speedometer, knee-grips, Ace disc wheels, and luggage grid, indistinguishable from new; £170.—Parker's, Bradshawgate, Bolton. [X6395

F.O.C.H. have a 1919 6h.p. Zenith, T.T. bars, accessories, grand condition; cheap.—5, Heath St., Hampstead (near Hampstead Tube Station). 'Phone: Hampstead 3752. Hours 9-7, including Saturdays. [8035

1920 Zenith 8h.p. Sports Model, only 3 months old, fitted with Flying Middleton sidecar, all lamps, horn, etc.; £127/10; exchanges or easy payments.—2, Nightingale Rd., Lower Clapton, London, N.E. [7672

NEW 8h.p. Zenith Model H Combination; £204, or on deferred payments; one-fifth deposit, balance by 12 monthly instalments, a small extra charge being made for credit terms.—Harrods, Ltd., 118, Brompton Rd., London. [8565

SPECIAL Red Zenith 1917 8h.p., direct drive, 2¼ to 1 top, Cox-Atmos, every accessory, tune, condition perfect, over 75 m.p.g., starts instantly, smiles at 60, a trial will prove this, fascinating appearance, photograph; offers or exchange A.B.C.—Advertiser, c/o Mineards, 1, Royal Terrace, Northampton. [7896

Miscellaneous.

IF you want a good privately owned motor cycle or car, apply Kwiksale Private Motor Registry, 35, Long Acre, W.C. Gerrard 2392. [0138

BOOTH'S Motories, Halifax.—1914 Enfield combination, £89/15; 1916 3½h.p. Brough, opposed cyls., 3-speed countershaft, and sporting sidecar, £81/10.

BOOTH'S Motories, Halifax.—1919 P. and M., with new sidecar, £110/10; 7-9h.p. Indian, with torpedo sidecar, £60/10.

BOOTH'S Motories, Halifax.—Six 1915 Douglases, £49/10; two 1918 4h.p. Douglases, £85/10.

BOOTH'S Motories, Halifax.—1920 5-6h.p. Rudge Multi, with Rudge sidecar and accessories, cost £170; price £127/10.

BOOTH'S Motories, Halifax.—3½h.p. N.S.U., mag. Grade gear, £15/15; 3½h.p. Ariel, £25/10.

BOOTH'S Motories, Halifax.—1915 Harley-Davidson combination, £97/10; 1920 Harley-Davidson and sidecar, £199/10; 1920 O.K. lightweight, nearly new, £44/10; O.K. lightweight, 2-speed, £34/10; 1920 Omega, 2-speed, £71/10; new 1920 6h.p. Ariel combination; 4½h.p. Quadrant; 4h.p. Douglas with new sidecar, £105; exchanges entertained. — Booth's Motories, Portland Place, Halifax. [2909

1920 Enfield, 1920 Verus, 1918 (late) 4h.p. Douglas; best offers, private; must sell. Knock twice. 43, Uxbridge Rd., Shepherd's Bush, London. [7847

DOUGLAS S. COX, the A.S.M.M., West Norwood, has several real bargains in motor cycles and combinations in his long advertisement under Cars. [7727

MOTOR Cycles, good second-hand, £15, £20; magnetos, belts, tyres; best red rubber tubes, 5/9; spares, accessories.—Flanagan, 86, Copenhagen St., Islington, London. [8572

Lightweights and the Future.

OF all the many types of motor cycle at present in existence, the lightweight has perhaps the rosiest future. So far an element of sport has pervaded the atmosphere which surrounds the motor cycling fraternity, but, though it is neither desirable nor likely that this feeling should drop out, the time will come, and indeed is almost with us, when a far more commercial spirit will prevail. The motor cycle has already proved its reliability in daily use, and the need for a multitude of reliability trials to prove this no longer exists. The motor cycle, therefore, may soon become the standard means of locomotion for all who can afford the necessary outlay.

It behoves us to study the requirements of the public who will form the largest proportion of buyers in the near future. Of what is this public composed? Chiefly of city workers, who by choice or necessity live some distance from their work. Such people do not require fast heavy machines, nor do the majority need passenger accommodation. A light, reliable machine, capable of a maximum speed of 30 m.p.h., would satisfy their requirements, but, above all, it must be quiet, and must protect the rider from mud splashes and oil.

The future demand for the proper lightweight at a reasonable price is enormous. What is wanted is a machine that will convey the rider to and from business with the utmost reliability, and be ready for a trip to the golf course, or a spin in the country at week-ends; a machine that will not only replace the pedal cycle, but also give a larger radius of action without effort to the rider. Such will be the machine of the future, and its forerunners already exist and give considerable satisfaction in the present day.

Our readers are aware that *The Motor Cycle* has carefully fostered the development of the lightweight, and our offer of a trophy for a lightweight race in the Isle of Man provided an opportunity for machines of 250 c.c. and under to astonish the world with a wonderful display of reliability and speed.

In a few days many prospective purchasers will be wending their way to Olympia, in order to examine the progress made in that type of motor cycle which most interests them, and the many excellent lightweights displayed will come in for a large share of attention.

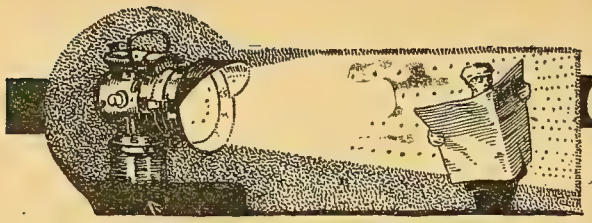
In the current issue will be found, in addition to our usual features, articles dealing with the lightweight movement from every point of view. These pages will form a most complete summary of the present position of the movement, and a perusal of the various articles and descriptions should do much to convince all that the present-day lightweight motor cycle is no longer in the experimental stage.

Lightweight Sidecars.

NEXT year there will be many lightweight sidecar outfits offered to the public, which will be engined with the same power plants as similar machines sold this year as solo mounts. We are constrained to remind our readers that a machine to be suitable for duty with a sidecar requires a strengthened frame, and that it does not follow because a 1920 model resembles its 1921 successor the same gauge of tubing has been used in its construction. Before fitting sidecars to existing light machines it will be advisable to ask the makers if the frame is suitable.

Since the gear ratio of a light sidecar machine is also a very important point, full satisfaction cannot reasonably be expected if ratios are used which have been adopted for a solo machine. This adds emphasis to the fact that adaptations may cause disappointment. We would urge manufacturers who contemplate marketing light machines for both purposes not to overburden the solo mount to make it suitable for two purposes. It will be unfortunate if there is a repetition of the earlier history of the sidecar machine.

An Index to the advertisements in this issue will be found on the page facing the back cover.



Occasional Comments

"By Ixion"

Lubrication Systems.

I SUPPOSE I feel the crudities of current motor cycle lubrication systems more keenly than most folk because journalists ride too many machines. The happy amateur who keeps his 'bus for two or three years, learns to understand it after the fashion of those mothers who can interpret every grimace and every inarticulate gurgle of their messy-faced offspring. But we poor dilettante testers are perpetually confronted with strange 'buses, and when we have at last learnt to oil them just so, they pass into other hands. Nevertheless, I am convinced there are many private owners who sigh for a motor cycle which only asks for a pint of oil to be put in its sump once a month, car fashion, and then lubricates itself unerringly and uncomplainingly for 500 miles or so. Will any genuinely automatic lubrication system grace any motor cycle at this year's Show?

3in. Tyres on Baby Two-stroke.

ANOTHER brain-wave from Dixieland. The Cleveland two-stroke is shod with—what tyres do you think?—26in. × 3in., gentlemen, no less! I am far from suggesting that the prices of all babies should be increased by fitting tyres which in extreme cases would stick £10 on to the catalogue figure. But there are enthusiasts who use the babies for long distance work, and 3in. tyres undoubtedly would go far to rule out the vibration which results from driving a little fellow too far and too fast. Will some reader who has comparative experience of the big-tyred Cleveland and small-tyred English lightweights let the Editor know how the innovation appeals to him? I am rather tickled with the notion of putting 3in. Palmer cords on a Douglas. These walloping tyres make such an addition to the comfort of a 500 c.c. 'bus that their effect on a lightweight should be quite interesting. But is it necessary to go quite so far? How do a pair of rather flabby 2½in. tyres feel on a baby two-stroke.

Kick-starting in Hobble Skirts!

I RECEIVE few plaints from our fair readers—possibly they know that I am old and plain, for the one Adonis on our staff reports a different experience. But I really had a letter from a lady rider the other day. She was denouncing kick-starters. At first I supposed that she was riding an open frame in a hobble skirt, but a timely postscript made it clear that she often rides in breeches, and that she owns a cycle car. Her statement, therefore, is that the male leg is a brutal and muscular instrument, developed by many generations of football, and the like, so that it is well able to start an engine. The feminine limb, if I understand her aright, is a more delicate and fragile creation, constructed for nothing more laborious than jazzing, and quite incapable of the dynamic output demanded by the starting of an average 500 c.c. engine; *a fortiori* it generally meets its Waterloo when confronted with an 8 h.p. twin and a kick-starter. Her dealer has solved the difficulty by substituting a long detachable hand crank for the original kick-starter. I think this protest is worth the notice of designers. Lady riders are increasing in numbers, and there is no doubt that the kick-starting of some 500 c.c. machines makes some men quite hot, damp, and blasphemous.

The Agent has to Live.

ONE reason why the £25 motor cycle and the £100 car still dally is that the agent has to live. Some stupid people imagine that the agent's commission is pretty easy fruit, but, after all, most of our readers would feel an agents' strike almost as much as a coal strike. Well, a certain syndicate is trying to put a very cheap 'bus on the market for 1921, and part of its costing scheme is that the agent shall get just 2½% commission on every 'bus he sells. In a few deals that 2½% would naturally be cheap money, for all the vendor might have to do would be to make out a receipt. But in another deal he has to teach the buyer to drive; put up with weeks of questions and nibbles; advise gratis after purchase on all sorts of matters; and, incidentally, pay his rent and rates, and sustain his hungry family. No other business is run on so narrow a profit margin, and it is obvious that the middleman is essential to our comfort and has his right to live. Therefore, something like a fiver on a cheap cycle and a tenner on a cheap cycle car must be earmarked for the local dealer, and the rock bottom prices of which some theorists prate are still impracticable.

One Day Trials.

I HAVE no sympathy with those critics who hold that the course of any one day trial can be too stiff, always provided that one man at least gets up each of the hills. These events have a complex function on our competition programme. Primarily they are intended to furnish a day's fun for sporting riders. Secondarily, they are utilised by the trade for purposes of local advertisement. They cut no ice with riders in other parts of England, who are well aware that a 150 mile non-stop does a machine little more credit one maiden over does a bowler. They were never meant to be a pothunter's Paradise, and the stiffer they can be made, the better the fun, provided a first-rate man on a first-rate machine has an outside chance of coming through with a clean sheet. They stand in an entirely different category from the big events of the season. These are keenly watched by a more ignorant section of the public, they should demonstrate what the machines can do, rather than what they cannot, and differentiate just enough to hall-mark the class of each mount. To my mind the Ilkley trial, the Scott trial, and the Welsh October trial were therefore very laudable competitions.

TAROUGA FEMININE GOGGLES

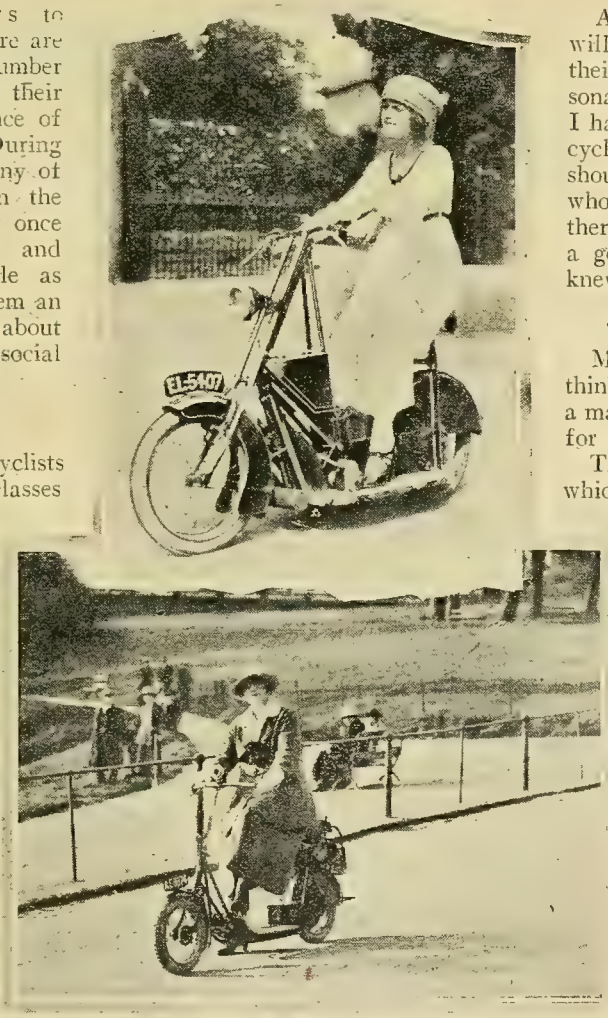
WHICH TYPE OF MINIATURE MOTOR CYCLE OR SCOOTER?

By Adele Barry

AMONG the visitors to Olympia this year there are bound to be a large number of ladies who have made up their minds to have the convenience of a motor-propelled bicycle. During the past year I have met many of my sex who have forgotten the prejudices against what they once considered a man's vehicle, and now regard the motor cycle as something which will give them an economical means of getting about for pleasure, business, and social work.

A Varied Appeal.

These prospective motor cyclists are representatives of many classes in the community. Some of them are young married ladies who require a machine upon which to do their shopping, because they live rather further out from the shopping centres than they need to do. Others are business girls who at present use trains and trams because the distance between home and office is a little too far for a pedal cycle. There is also a large number of motor cyclists' wives who wish to learn for themselves the joys of driving, since their husbands appear to have for hundreds of miles without complaining of the monotony of the journey.



Two types of open frame miniatures suitable for ladies. Top, a Kenilworth, which weighs but 70 lb. Below, a Skootamota.

As to which type of vehicle they will decide to buy depends upon their special requirements and personal taste; but from conversations I have had on the subject of motor cycling with others of my sex, I should estimate that for every lady who will buy a man's machine, there are a dozen who would buy a genuine lady's machine if they knew of its existence.

Special Models Wanted.

Manufacturers are inclined to think that because ladies can ride a man's mount, there is no demand for one built specially for them.

There is not a lady's machine which conforms to the ideal of the majority of the would-be buyers; but if it were made, probably it would be a compromise, embodying the best features of the few machines favoured by those who will not consider the "diamond" frame.

Personally, I am not so restricted, because I am quite content to ride a man's machine, and any of the many excellent lightweights which will be on show will meet my requirements. But despite the general opinion that a man's machine is all a lady requires, I maintain that I am an exception when the whole of the market for ladies' machines is considered.

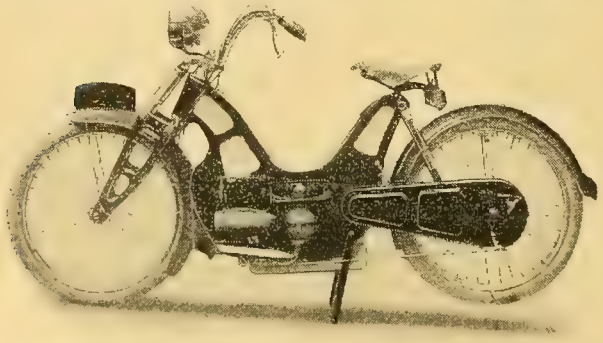
Through Feminine Goggles.—

I will give an example, typical perhaps of many to be found in different parts of the country. I belong to a tennis club, of which a large number of girls and married ladies are members. Altogether there are nine of us owning motor vehicles. Two have small cars, one has a sidecar outfit, two own Kenilworth Miniatures, one a Skootamota, another a Whippet, the eighth runs a Douglas lady's motor cycle, and I complete the motoring contingent with a Velocette. This is a fairly representative fleet of machines; and as fully a dozen ladies are considering buying machines for next year, it is interesting to sum up their opinions, always remembering that none of these ladies are yet motor cyclists. One only favours a man's machine. She is seventeen, an outdoor girl who prefers the more strenuous games of the opposite sex to those which our grandmothers would call "ladylike." Another wants the obvious power and speed of the Douglas in a machine as light as the Kenilworth scooter, and having a similar open frame. Four have decided to invest in miniatures, and their ultimate choice will rest between the Kenilworth, Skootamota, Whippet, and Autoglider; while another has tried a spring frame Macklum, and has voted in favour of its comfort rather than its speed, although—perhaps these future scooterists do not know it—all the miniatures mentioned — Kenilworth, Skootamota, Whippet, Autoglider, and Macklum—are capable of speeds good enough for all work excepting high averages on tour.

Making a Convert.

Others are in favour of the Ixion, Sun, and Cedos lady's models, and are also awaiting the introduction of the new Velocette lady's machine, which we understand is to make its *début* at Olympia.

I will give another example to show that, to initiate ladies into the joys of motor cycling, a small open frame is necessary. I have lived for years with an aunt who is now over fifty years of age. Since long



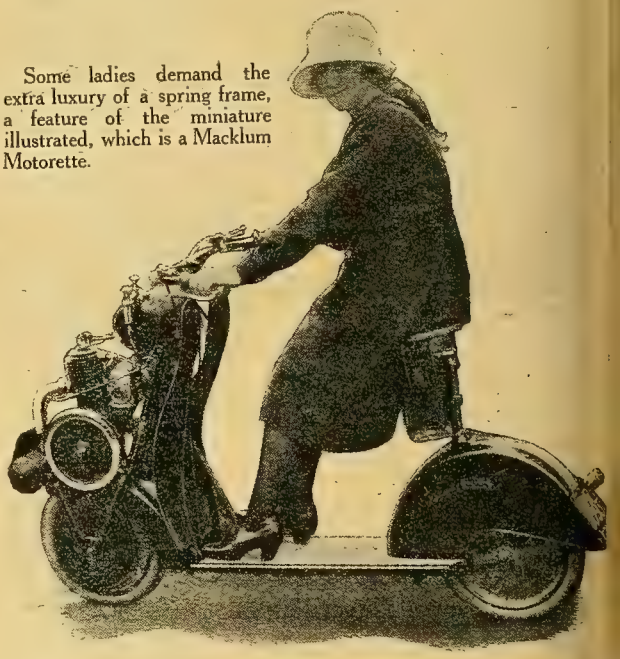
An open-frame lightweight, of which much is expected. The 2½ h.p. Pullin has a pressed steel frame, and is to be sold at a popular price.

before the war I have ridden men's motor cycles—the first one belonged originally to my brother, who gave it to me when he went aboard. During all this time my aunt has not taken any interest in my machines. A few weeks ago, however, a friend on a seatless scooter called for me, and my aunt *thought* it was just what she wanted.

"How do you like it?" I asked.

"Quite good, in its way," was the reply. "I have to get off to rest occasionally. If I go too far without dismounting, I fall on my knees when I do stop."

My aunt was very disappointed, but great was her excitement when, a few weeks later, she saw the same machine fitted with a seat. She now *knew* what she



Some ladies demand the extra luxury of a spring frame, a feature of the miniature illustrated, which is a Macklum Motorette.

wanted, and lost no time in investing £50 in this machine, incidentally, a Kenilworth, which, by the addition of a comfortable seat, was changed from a doubtful to a really practicable proposition.

For all Ages.

Now the number of ladies over fifty who will buy an ordinary motor cycle is not great, but, given a machine which it is possible to ride without special clothing, which is light, small, and easy to handle and there is a possible market almost as great as that promised by the lay press writers when they foolishly boomed the stand-up scooters.

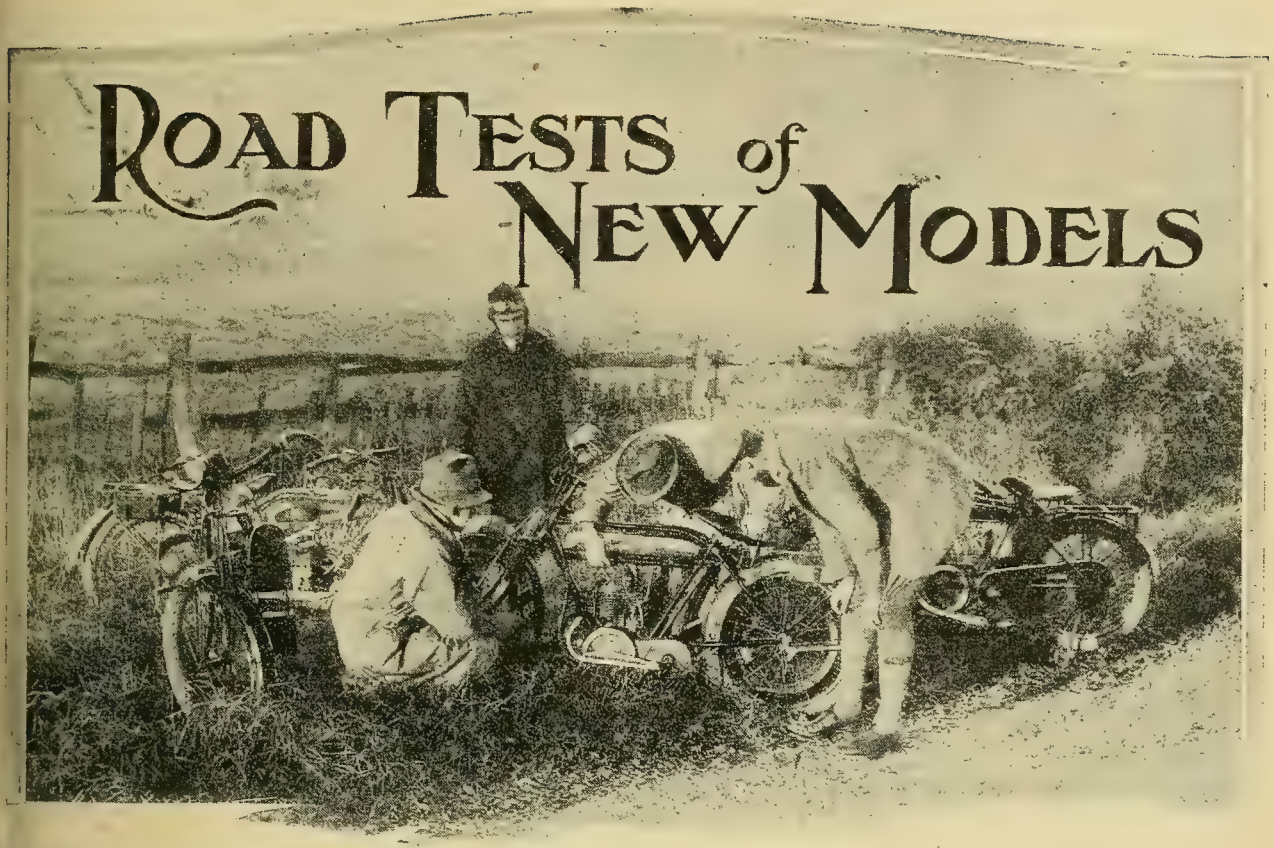
Once they have used miniature machines, a good proportion of these lady owners will buy larger machines. Only the other day I discovered my sporting aunt trying the riding and skirt position of my man's type Velocette.

The Open Frame.

As regards sidecar driving, I have found that some people still seem to think that ladies look ungainly when astride a man's sidecar outfit. For this reason perhaps, the Scott, with its open frame, always attracts the woman who is thinking of buying a passenger machine. Now, at the last minute, the Editor advises me that the makers of the Cedos machine are to have at Olympia a neat little sidecar outfit built specially for ladies. Although I have not been waiting for such a machine myself, there are probably dozens who have. It may, for instance, suit my aunt, besides a lot of other people.

BI.

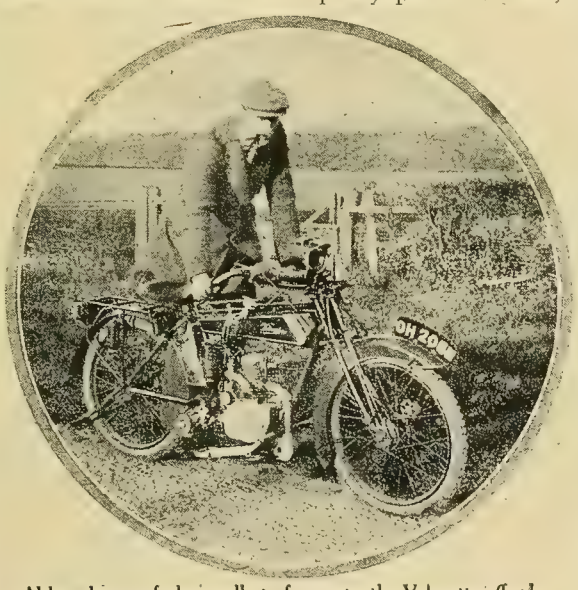
ROAD TESTS of NEW MODELS



THE THREE-SPEED VELOCETTE.

THAT a lightweight team should be one of the runners-up for the team prize in the A.C.U. Six Days Trials is an achievement that brings orward the possibilities of this type of machine. lessrs. Veloce, Ltd., are the manufacturers of the ttle machine which thus distinguished itself, and nerefore it was with considerable interest that we ook over one of the identical notor cycles which contriuted to this success. It was ot long before we realised nat as regards power the achine was fully capable f tackling any hill on which heel grip could be obtained, r quite severe gradients ould be ascended on the ighest of the three gear tios. Critics will at once nagine that the engine was nder-geared, but this conntion is at once refuted by ne speed attained under rdinary road conditions. It ill be remembered also that the conclusion of the trial ne of the team attained a eed of over 40 m.p.h. on rooklands. The Velocette one of the few machines hich gives the impression of being designed throughout with the idea of forming a uniform whole rather than a series of assembled units.

Having a cylinder of 62 mm. × 73 mm. (220 c.c.) of the normal three-port type, the engine is a self-contained unit, including a large oil sump and mechanical oil pump. This pump is an extremely pretty piece of work, having a combined rotary and reciprocating motion. The flow of oil is adjustable, and the pump may be relied upon to do its work with absolute regularity and thoroughness.



Although one of the smallest of mounts, the Velocette affords a comfortable riding position for the tallest of men.

This system is more cleanly than the "petroil" system, and is probably more effective, since the oil is definitely delivered to such parts as are most in need of lubrication.

Chain drive throughout is an uncommon feature on lightweights, nevertheless the Velocette is so equipped, and the chains are protected by an ample metal shield. Both two and three-speed models will be marketed for 1921, and the machines used in the Six Days Trials were fitted with the latter type.

Constant mesh gears, locked by a simple form of

Although only 220 c.c., the Velocette can maintain quite a high average road speed without unduly forcing the engine.

dog, are employed, and the changes are effected by a neat lever which is rotated by the right hand. The gears change easily, but the operating gear requires a little practice, probably because the motion is not one to which the average rider is accustomed. Both brakes are of the internal expanding type, and function smoothly and powerfully, and the mudguarding appeared very satisfactory, though owing to good weather conditions, this was not fully tested during our trial.

Up to a speed of 30 m.p.h. the engine runs smoothly and pulls magnificently, but if driven at much in excess of this speed a certain amount of vibration is noticeable in the handle-bars, which increases with the speed.

This is, perhaps, our only criticism of a machine which is replete with refinements, and it is not of any great importance, since it is seldom that the rider of a lightweight pushes his machine above this speed.

Throughout our trial, which extended over several days, the Velocette ran regularly and well, with the exception of a mysterious magneto trouble, which prevented a start on one morning, through the entire absence of current at the high-tension terminal. This trouble was overcome after a short period of drying.

Aluminium footboards and a large saddle help towards making the Velocette the serious touring proposition which it undoubtedly is, and in conclusion it may be stated that we know of no genuine lightweight which is more capable of undertaking hard work with fewer symptoms of drying up.

THE 2¼ h.p. NEW HUDSON.

THE average motor cyclist of experience who has always used a machine of 3½ h.p. or over, is rather apt to regard a 211 c.c. engine as something in the nature of a toy. The little New Hudson has such an engine, but it is far from being a toy. Probably, in a few years, no solo machine will be

The average solo motor cyclist requires a machine with which it is possible to place both feet flat upon the ground. Riders below the average height will find that the New Hudson provides an exceptionally low saddle position.

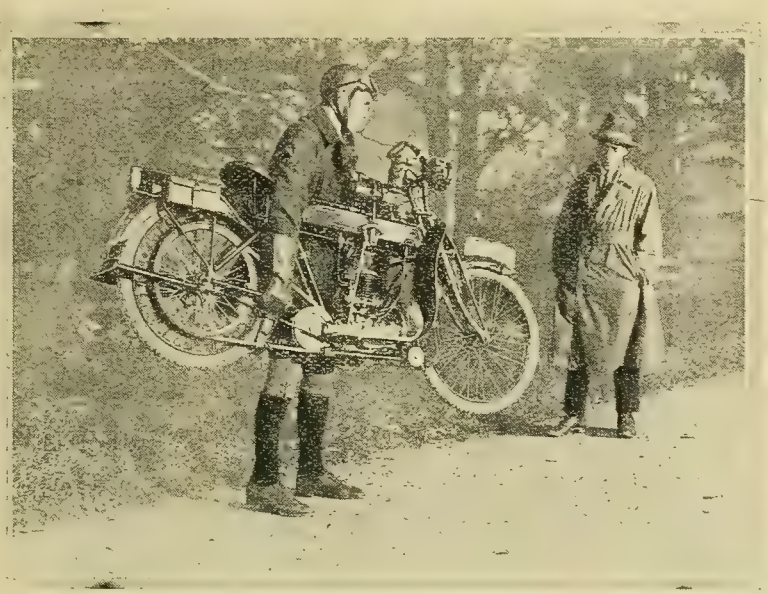
Road Tests of New Models.—

considered seriously unless it weighs less than 150 lb. To-day idealists maintain that it is absurd to use a machine weighing more than the usual load it is required to propel, and that a solo machine should not weigh more than 1 lb. for every lb. of the rider, and that the engine should have a capacity equalling 1 c.c. per lb. of the weight unladen.

In the hands of the average owner the difference between its speed and that of other machines of larger capacity is very little, for although there are many motor cycles capable of 50 m.p.h., very few are ever ridden even at 40 m.p.h., although the owner may think so. We may therefore consider 40 m.p.h. to be the maximum speed capabilities of the majority, and if a New Hudson rider set out in company with a friend on a larger machine, and a T.T. ride was not their intention, the latter rider would not get very far ahead of the lightweight.

In a true speed burst, of course, obviously, the little New Hudson would be left behind, but all riders are not "speed merchants," and nine out of ten riders of 2¾ h.p. and 3½ h.p. mounts would not have to regulate their usual pace to suit the other. By this we mean that the New Hudson is fast enough for the majority.

We recently tested one of the 1921 models, but prior to this a member of the staff had a pre-war New Hudson, with the same engine, which was used by his daughter, and we know that the lightweight always managed to keep a well-known sidecar outfit in sight, although the latter was in the hands of one who probably maintains higher averages than most of his colleagues. On one occasion, in the early morning, the sidecar and the New Hudson covered the distance between Taunton and Coventry, 140 miles, in 5½ hours, an average of about 26 m.p.h., which performance illustrates the point of speed capabilities mentioned above, for without incurring risks the sidecar could not have improved on this time had it been alone.



Although not so easy as it appears, in an emergency it is possible to lift the little New Hudson, which may give some idea of its weight.

We found the 1921 New Hudson quite fast enough for all but impromptu speed competitions with larger machines, but it more than held its own in "scraps" with others of its class. This was with a new engine, which should have been treated more kindly. On these occasions no inconvenience was experienced through engine vibration, usually a weakness with small single cylinder engines at speed.

Far more important, however, than the question of speed, was the light weight of the machine and its tractability. We found it much easier to move about than most of those miniatures known as scooters, while its low saddle position and the weight distribution gave a sense of security not found on all machines by any means. For its height and wheel diameter, the wheelbase is comparatively long which, in conjunction with the steering angles, makes for comfort—in fact, we found the machine gave none of those peculiar sensations usually attendant with 24in. wheels.

As the machine is quite easy to paddle off, a kick-starter and clutch are not fitted, and in a few yards the engine picks up its proper cycle of two-stroking, which is one of its most pleasing features.

Regarding its hill-climbing capacity, we found that it will negotiate most main road hills on "top"—in fact, the machine previously referred to had to climb Stoneleigh Hill, near Leamington (gradient 1 in 9), on top and without distress, or its fair owner considered it required attention. The gear change is easy, and in low gear the machine we tested appeared capable of any gradient likely to be met with by the majority of riders.

In addition to being a touring mount, the New Hudson with its 100 m.p.g. consumption, ample mudguarding, and extreme handiness, should be eminently suitable for the business man or woman who requires a general utility machine, while the parent who wishes to present his boy or girl with a motor cycle will find it all a lightweight should be, in regard to reliability and handiness.

THE 3 h.p. IVY TWO-STROKE.

AMONGST the machines which come our way for the purpose of a journalistic test, there are occasional specimens which immediately mark themselves as being rather out of the ordinary.

In taking a machine over with the acknowledgment that it is only to be used for a comparatively short period, one is apt to form an impression quite different from the feeling which would be aroused by a machine which was to be used continually under all kinds of conditions. After having ridden a machine during a prolonged period most owners begin to have some sort of affection for its qualities, but this state of mind seldom develops in the course of a brief mileage which may not at the most exceed 200 or 300 miles.

If any particular machine in such a short distance impresses itself upon the rider in this way, it may be assumed that it has some exceptionally good features,

Road Tests of Mew Models.—

and it may be said that during a fortnight's use of the 1921 model 3 h.p. Ivy two-stroke, impressions were formed which made us very regretful on the day when it had to be returned.

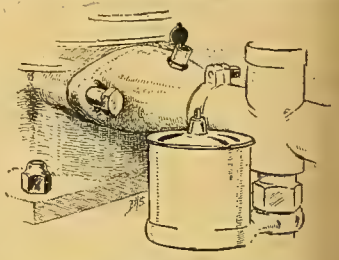
A "350 c.c." Two-stroke.

Primarily, the test of the Ivy was devoted more or less exclusively to the engine, as the frame and transmission were not quite the same as will be used on the standard production for 1921. The machine we used was a competition model which has been used through many of the trials of the present year, and it also was the same one which made twenty-five non-stop ascents of the Old Wyche, at Malvern, in August. The engine itself, however, was exactly the same as those which will be supplied to the public next year, and it has a bore and stroke of 75 × 79 mm., the capacity being 348 c.c. These dimensions, of course, are rather in excess of the usual run of air-cooled two-stroke power units, but, although difficulties have been experienced in the past due to overheating and plug troubles, when a capacity of 250 c.c. has been exceeded, none of these defects were experienced in the case of the Ivy.

Full Throttle Maintained Indefinitely.

Indeed, of the engine we may say that, providing the drip feed lubricator was set correctly, it could be driven "all out" for indefinite periods without showing any signs of overheating or drying up; hill-climbing also was exceptionally good, and, in general, the performance on top gear was much the same as the result which we used to obtain from the 500 c.c. single-cylinder four-stroke solo touring machines of 1912.

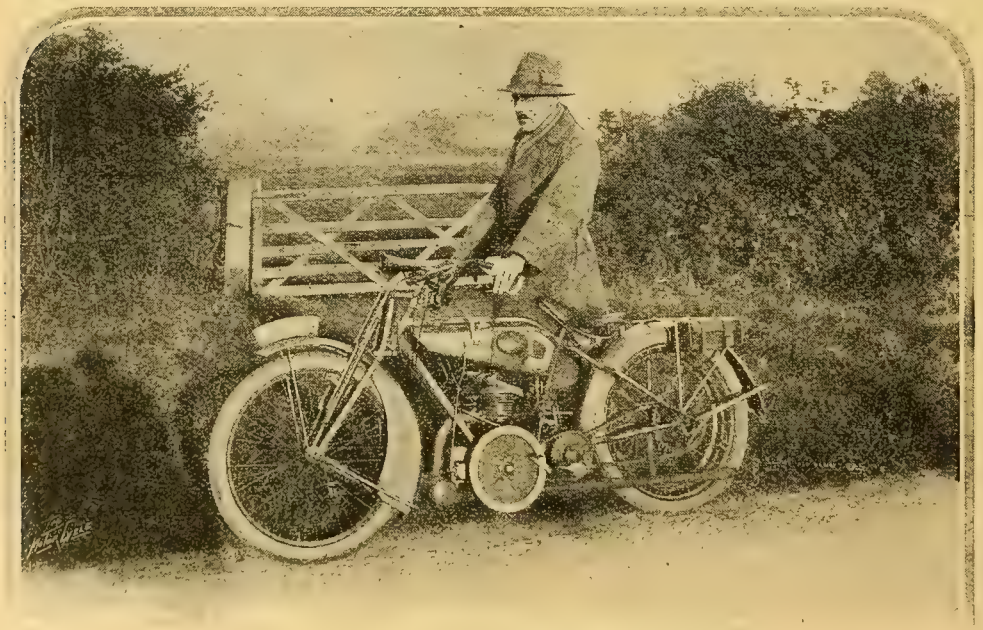
One very noticeable difference in connection with this particular engine, as compared with most two-strokes which we have ridden, is its remarkable range of responsiveness to the throttle. Indeed, the engine two-strokes perfectly from the lowest speeds upwards; for instance, when passing through a town, the throttle can be closed until the speed drops to almost a walking pace without any suspicion of that "hunting" or misfiring (four-stroking), which is so common a defect of the two-stroke engine as a class. At the same time the response to the throttle was instantaneous, and the acceleration so good, that in quite a short distance a speed round about 40 m.p.h. could be obtained on the level.



A spring-lid oiler on the induction pipe admits extra air or facilitates injection; the latter, however, was never necessary during our test

Essentially a Touring Engine.

It is doubtful whether a greater speed than 40 m.p.h. on the level could be reached with the gear ratios which were used; indeed, the engine has not been developed for abnormal speed so much as for tractability and smooth running under normal conditions. In short, it is intended to be suitable for the great majority of riders who prefer a machine which is smooth to drive and sweet running, rather than one which gives abnormal speeds at some sacrifice of controllability.



The transmission of this 3 h.p. Ivy model was specially arranged for freak competition riding, hence the three-speed gear. Standard models have two speeds, but the engines are identical.

No doubt the 3 h.p. Ivy engine owes much of its qualities to the very large flywheel which is fitted, and under ordinary circumstances on Midland roads it was never found necessary to use the low gear other than for traffic riding. As the machine we used had been tuned up for competition work, its petrol consumption was rather high, being in the neighbourhood of 65 m.p.g.; this could, no doubt, be improved by the fitting of a smaller jet, and also by making more use of the extra air inlet which is fitted to the induction pipe on the cylinder. This fitment for the most part we did not use (a culpable example of laziness in these days of high petrol prices!) One little point we may criticise is the lubrication system. This is quite satisfactory in use, but the engine appears to be somewhat sensitive to over-oiling, and if the drip feed valve is not shut off when the machine is left stationary, a considerable amount of oil drains through into the crank case, and in consequence tends to soot up the sparking plug when the engine is first started.

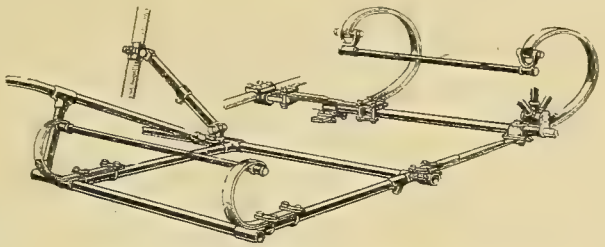
THE BEARDMORE-PRECISION TWO-STROKE SIDECAR OUTFIT.

NO doubt as a result of the expenses of living, which ever appear to be on the increase, motor cycle manufacturers are paying greater and greater attention to the development of light and low-powered sidecar outfits.

The general public, also, are watching these developments with more than ordinary interest, for the same reason.

Only a few years ago it seemed almost an absurdity to expect a small machine in the two-stroke lightweight class to perform any services more strenuous than that of carrying a solo rider over ordinary main roads, but improvements in two-stroke engine construction have of late been so rapid and the increase of efficiency so great that it is now possible to produce a machine with an engine not exceeding 350 c.c. which answers the requirements of most riders, even when used with a lightweight passenger attachment.

No one, of course, expects a small, low-powered machine to perform wonders in the way of freak hill-climbing, nor does any reasonable person desire all the luxuries and comforts of the expensive high-powered outfits on a machine of some $2\frac{3}{4}$ or 3 h.p. which is produced with an eye to low first cost and small running expenses.



The unique Beardmore-Precision chassis in which the axle tube is connected to the machine and the rest of the chassis by means of leaf springs.

Passenger Machines for the Multitude.

One of the earliest examples of the larger two-stroke lightweight (that is, exceeding 250 but not exceeding 350 c.c. capacity) is the spring frame Beardmore-Precision. This machine is well known as being equipped with an exceedingly original springing system, which is applied to both wheels, while the power unit is an air-cooled two-stroke engine of 350 c.c., possessing, amongst many other novel features, a very efficient mechanical lubrication system. Originally the machine was developed purely as a solo mount, but its power output has been so satisfactory that it was believed to be quite suitable for light passenger work, and if the model which we tested is to be taken as an example, the belief is perfectly justified.

A sidecar suitable for the Beardmore-Precision must necessarily be of special design in order to give satisfactory service in conjunction with the spring frame, and in consequence a design has been evolved in which the chassis is ingeniously sprung, the connections to the machine being more or less flexible.

The Sidecar Chassis Described.

The main or rigid portion of the chassis is attached at four points to the central portion of the motor

(Left) Trying to reconcile "summer time" with the hour indicated by Old Sol on the dials of Saintbury Cross in Gloucestershire. The Beardmore-Precision light sidecar outfit is an admirable little vehicle for week-end trips in search of beauty spots and antiquities.

(Right) On the road with a spring frame, spring chassis, 350 c.c. air-cooled two-stroke Beardmore-Precision passenger outfit.

Road Tests of New Models.—

cycle frame, and the axle which carries the sidecar wheel is connected to the chain stays of the machine and to the fixed portion of the chassis by means of flat leaf springs. In consequence, the sidecar, axle, and wheel are the only unsprung portions of the construction. The body of the sidecar is mounted on independent leaf springs, and is not connected in any way with the springing system of the chasssis. It was found that the sidecar gave quite a high degree of comfort as compared with many ultra-light attachments such as are normally fixed to machines of low power, but from the driving point of view the flexible nature of the sidecar axle attachment, acting in conjunction with the springing of the machine itself, made a certain amount of practice necessary before the steering became a matter of certainty, as at high speeds there was a tendency to sway.

On the road the Beardmore-Precision outfit proved itself to be a decidedly economical vehicle for two persons, since the petrol consumption was exactly 60 m.p.g., while the consumption of oil appeared to be almost negligible. Speed with sidecar and passenger was probably not greater than 28 to 30 m.p.h. as a maximum, but, under favourable conditions, all the ordinary main road hills of the Midlands were climbed with comparative ease, despite the fact that only two gears are used. The driving of the machine generally is very simple, since the gear control mechanism is mounted on the handle-bars, and the selective clutch arrangement enables one to change from high to low, or *vice versa*, without making use of the compression release.

The general finish of the machine is excellent, and wherever it stopped attention was almost invariably attracted by reason of its handsome all-black finish. The equipment, too, is excellent, and the tool box which replaces the carrier, being fitted with a compartment for the various tools and spares, is very convenient.

THE O.K. JUNIOR.

THAT "one man's meat may be another man's poison" is a well recognised saying, and one which applies to motor cycles perhaps more than anything else. Seldom is it found that one man's verdict that a machine is good is endorsed by the majority of his fellows, and especially is this so where lightweights are concerned.

In criticising a lightweight one rider may say it is too small, another that it is too large, or a third will condemn the riding position or the steering. So to find a compromise that invites no criticisms from a group of riders of both sexes and of various heights and tastes is no mean achievement. Messrs. Humphries and Dawes have done this in their popular-priced O.K. Junior, which we have had under test for some time.

Although the frame of the O.K. Junior is standard in design, the light weight and low riding position of the machine make it an admirable ladies' mount.

Owing to pressure of work on account of the near approach of the Show, long-distance runs have been curtailed, and our tests of the O.K. have been made under such conditions as a large number of lightweights are required to meet. That is, to be always ready for a short journey, and to do the trip quickly without any delays through having to open the toolbag. It has been everybody's hack—including that of a lady member of the staff, who is an enthusiast where two-stroke lightweights are concerned, and can give, from road experience, the woman's viewpoint of most machines.

In Many Hands.

Thus the O.K. Junior has received tests at the hands of many members of the staff, all of whom report favourable impressions of its all-round service as a machine suitable for the business man who has a great deal of traffic work to do, the hand-controlled clutch and low riding position rendering the machine easy to handle under all conditions.

So far as the lady is concerned—well, she intends to buy one, which fact conveys more than her eulogy anent its performance. Incidentally, this lady is a hard rider, and up to her trial of the O.K. had been wavering between another two-stroke and a $3\frac{1}{2}$ h.p. model.

Now the writer has always preferred a four-stroke engine for every purpose from scooter to car, but of late the excellent running of certain two-strokes has brought about the removal of what is now admitted to be a prejudice. The hundred miles test of the O.K. has clinched the argument in favour of the simpler machine, not so much on account of its speed and its steering qualities, but chiefly because it does not display those characteristics which set up the prejudice in the first place. It is perhaps only a point of fastidiousness, but until recently two-strokes have been likened unto a Chinese cracker of the most offensive kind, while at other times a "bee in a bottle" was regarded as a good simile. These opinions, after all, were perhaps more cynicism than criticism, and are now recognised as being unfair to the modern two-stroke in general and the O.K. Junior in particular.

It is fast enough for all but the speed merchant, who makes a fetish of speedometer readings, and regards American records of 100 m.p.h. and over as the ideal speed; it steers itself, and the springing of the forks is excellent. The Villiers flywheel magneto engine runs very sweetly, and two-strokes regularly at exceptionally low speeds.

Road Tests of New Models.—

What is just as important to a large number of buyers is the fact that a short rider will find that when off the saddle he may handle it without the unpleasant sensation that it is invested with a heavy-weighted demon who wishes to lie down.

This is a point which will be appreciated most by the motor cyclist who uses his machine every day, and who, in taking it from its stable, may have to wheel it backwards round such awkward objects as a rockery, a rain water butt, or a frail pergola. Incidentally, villa residents who are inconvenienced in this way will find it easier to "get out" if they sit astride their machines.

Altogether our impressions of the O.K. are that its comparatively low price is not due to lack of quality either in material or in workmanship, but rather to design and good manufacturing facilities. It is exceedingly well made and finished, and in every way comes up to our expectations when we first saw it "on paper" and inspected the works in which it was to be made.

Part of the road test of little O.K. was undertaken by a lady, who found it an easy machine to handle, and fast enough for all ordinary requirements.

A Lightweight Trial in the Transvaal.

Success of British Miniatures disposes of the Fallacy that only Big Machines are suitable for South Africa.

100-MILE endurance trial for lightweights was organised by the Rand M.C.C. at the end of September, owing to the very severe conditions, seven of the seventeen starters com- ed the course.

e event was a handicap, and resulted win for one of the smallest of the sh lightweights—a Royal Enfield— e a Clyno finished second, and an rican Cleveland third. Douglas lightts took fourth and fifth places with A.B.C. and an A.J.S. sixth and ith respectively.

cording to a South African correlent, it was astonishing how well the machines stood up to the road conas. Notwithstanding the remarkseverity of the conditions, the trial demonstrated to potential buyers e Rand that the modern lightweight sound piece of work—a go-anywhere ine, and not merely a town potterer. performance of B. Ressell on the Enfield was remarkable for the conсy of his lap times, given as follows: 36m.; second, 37½m.; third, 38½m. ding petrol replenishment); fourth, ; and fifth, 38m. This is real relia- especially as the machine required echanical attention throughout. The Clyno, like the Enfield, was the only one of its make entered, and ran a very good second on the handicap. F. Nissen, the rider, was delayed by sparking plug troubles only.

The winner of the Lightweight Race in South Africa on his two-stroke Enfield.

The fastest time was made by T. Nicholl on the A.B.C. He had to give the Enfield 1h. 15m. start—a little more than two laps out of five—and this, of course, proved an impossible task.

The engine limits allowed were rather over what is generally accepted as coming within the lightweight class. They admitted machines such as the A.B.C., of 398 c.c.; and the A.B.C. evidently frightened the handicapper!

The winning Enfield two-stroke was dismantled for examination. The engine (No. E4076) was reported as obviously a new one, and the bore was verified as agreeing with catalogue dimensions. These are 64 bore and 70 stroke (225 c.c. capacity).

The order of awards is as follow:

1. B. Ressell (Royal Enfield), 225 c.c.
2. F. Nissen (Clyno), 269 c.c.
3. C. Wolkswinkel (Cleveland), 225 c.c.
4. I. H. Scott (Douglas), 350 c.c.
5. C. Scott (Douglas), 344 c.c.
6. T. Nicholl (A.B.C.), 398 c.c.
7. A. Bosch (A.J.S.), 350 c.c.

A REVIEW OF 1921 LIGHTWEIGHTS WHICH WILL BE EXHIBITED AT THE MOTOR CYCLE SHOW.

The Motor Cycle Show at Olympia will be opened to the public on Monday, Nov. 29th, and will remain open until Saturday, Dec. 4th. On this and subsequent pages we give a resume of the lightweight exhibits which will interest a very large section of the community.

Alecto.

THE Alecto, which will go down to fame as the first two-stroke to break long-distance records at Brooklands, may be obtained either as a readily converted single geared machine, or with two speeds, clutch, and kick-starter. A magnalium piston and drilled connecting rod enhance the efficiency of the 76×76 mm. (345 c.c.) two-stroke engine, which now has an improved release valve and exhaust pipe fitting. For sidecar work, a specially strengthened frame, larger tank, and footboards are substituted, and a light but strong sidecar is supplied to suit.

Armis.

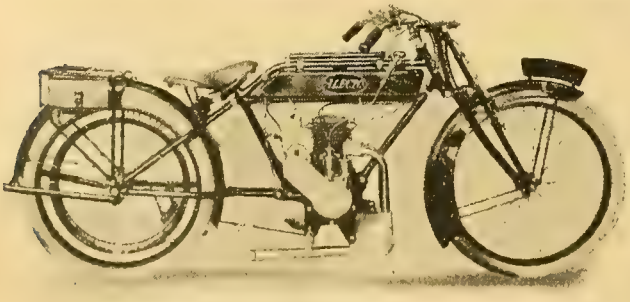
A 350 c.c. Precision two-stroke engine is fitted to this machine, making it larger than the usual run of two-stroke lightweights. Indeed, the makers rate their production at 3½ h.p. which figure, to our knowledge, is easily developed by this engine. A light sidecar is supplied to fit this model. An addition to the Armis range is a similar machine with a 2¾ h.p. four-stroke J.A.P. engine, which sells at the same price as the two-stroke.

Beardmore-Precision.

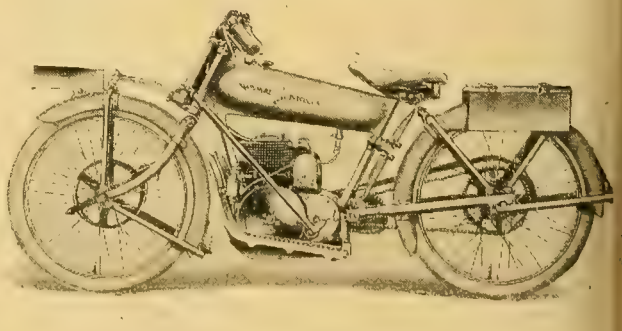
One of the sensations of Olympia last year was the Beardmore-Precision, embodying as it did so many novel features in an actual production model. A number of detail improvements have been made for 1921, including integral handle-bar control levers, a reduced gear ratio for the kick-starter, and a lighter rear stand. The design of the cylinder and piston have been modified so as to allow as far as possible of an easy flow for the exhaust gases. The automatic system of lubrication has been modified in one detail only. It is claimed that the net result of these alterations has been to add so much to the power of the machine as to allow prolonged light sidecar work.

Bradbury.

The old-established Oldham firm will continue to market their sturdy little 2¾ h.p. model for 1921. It will be remembered that this machine has a 74.5×80 mm. (349 c.c.) four-stroke engine, the crank case of which is of the well-known Bradbury principle, *i.e.*, a malleable iron casting forming part of the main frame. The frame itself is of duplex construction in front, and in addition has an auxiliary stay from the seat-pillar to the bottom bracket. A three-speed countershaft gear and cork insert clutch completes a very full specification.



Brooklands has proved the Alecto two-stroke and this T.T. model should be popular in 1921.



Outwardly the Beardmore-Precision is little altered; but new piston and cylinder design gives considerably increased efficiency.

British Excelsior.

Two types of engine, a 2⅜h.p. Blackburne or a 2½ h.p. Villiers, form the main distinction in the British Excelsior range of lightweight models. A two-speed gear clutch and kick-starter is standard on the former, while the Villiers engined machine may be single-geared, fitted with a plain two-speed box, or, as the 2¾ h.p. model, incorporating clutch and kick-starter. All these models have frames of well-proportioned design with sloping-top tube. Gracefully curved mud shields add to the appearance, instead of marring it as is more usual.

Clyno.

The Clyno lightweight has been so successful both in the competition world and in private ownership that it will remain constructionally unaltered for 1921. The integral gear box and 269 c.c. two-stroke engine are well-known features. A metal-to-metal plate clutch takes the drive by belt to the rear wheel, the front pulley being protected by a distinctive aluminium shield. Drip-feed lubrication to the transfer port combines the advantages of this and the "petroil" systems. Including the magneto pinion, only five gear wheels are used in the Clyno primary drive and gear box.

Coulson B.

A re-designed frame, giving a saddle position nearly six inches lower than previously, is the main improvement on the 1921 Coulson B. This big reduction in height is also helped by the new method of carrying the saddle, *i.e.*, by dispensing with the conventional seat-pillar and clipping the peak to a lug on the top tube and the coil springs to a special bracket. The tank, which, contrary to usual practice, is made throughout by the company, has been simplified and reinforced, and is now a very sound job. The 2¾ h.p. Blackburne engine and neat and efficient spring frame are, of course, retained.

Diamond.

An extended range of Diamond lightweights will be marketed for 1921—five models in all, fitted, variously, with Villiers and J.A.P. engines. The Sturmey-Archer two-speed gear box, clutch and kick-starter, and the equally well-known Enfield two-speed gear box, cater for varying tastes in the matter of gears. The framework is on the straight tube principle, and the result is enormously strong, and at the same time quite attractive.

Douglas.

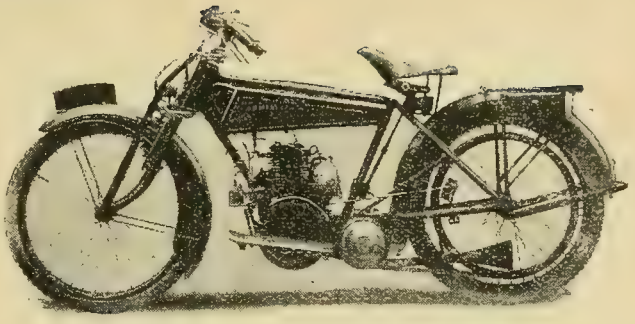
Although the Bristol firm is introducing a new 3½ h.p. sporting model, the 2¾ h.p. machine remains unaltered, and no summary of lightweight machines would be complete without some reference to this most popular and long-established design. Long before the term "flat twin" came into use, Douglas Motors, Ltd., were successfully exploiting this type, and last year saw considerable detail alterations, including a three-speed-geared model, bringing their range thoroughly up to date. A simpler, plain, two-speed gear model is retained in addition.

Kingsbury.

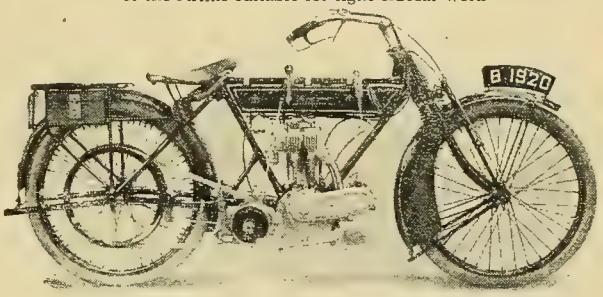
Reference to the new two-speed gear box and new spring forks fitted to this machine was made in the issue of *The Motor Cycle* of September 30th. The gear is of the double chain, cam-operated expanding clutch type, and provision for ready adjustment is neatly incorporated. Somewhat similar to a well-known pattern, the spring fork has a small coil spring located at the front of the main compression spring. A very large capacity silencer now reduces the exhaust noise of the efficient 2¾ h.p. two-stroke engine. The scooter hitherto manufactured by this firm has now been discontinued.

Levis.

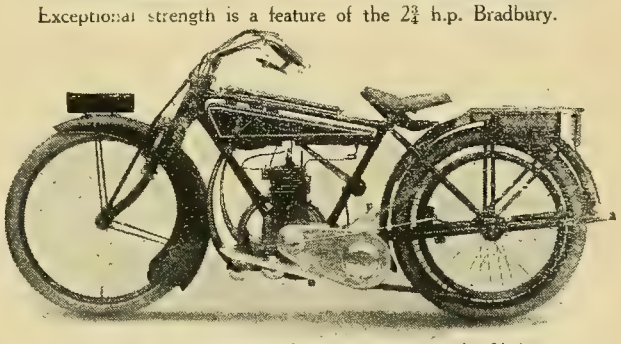
In addition to being one of the pioneers of the two-stroke lightweight movement, the Levis is one of the few makes which remains unencumbered with gears or clutch and similar weighty refinements. True, the new 2½ h.p. T.T model will have a three-speed gear box and clutch in its final state; but the popular 2¼ h.p. Levis remains a striking example of extreme simplicity. A touring, sports, and lady's model, differing in detail only, will be shown, all with the latter type engine, which retains the features which Messrs. Butterfields have found so successful in the past.



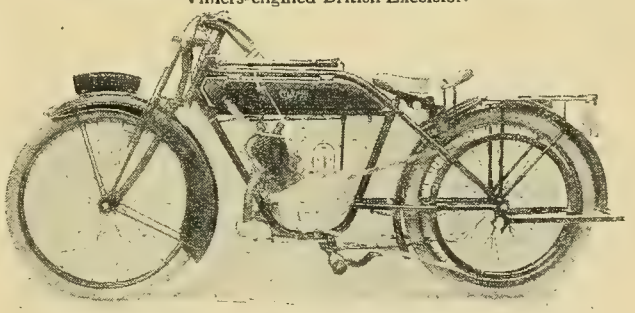
A 350 c.c. Precision two-stroke engine makes this model of the Armis suitable for light sidecar work



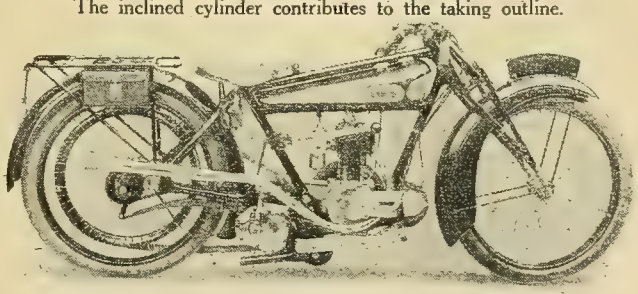
Exceptional strength is a feature of the 2¾ h.p. Bradbury.



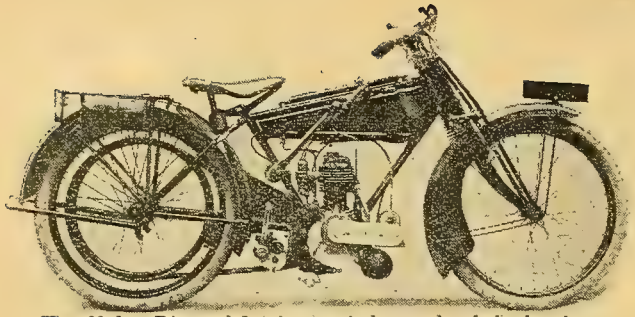
Curved leg-guards add to the appearance of the 2½ h.p. Villiers-engined British Excelsior.



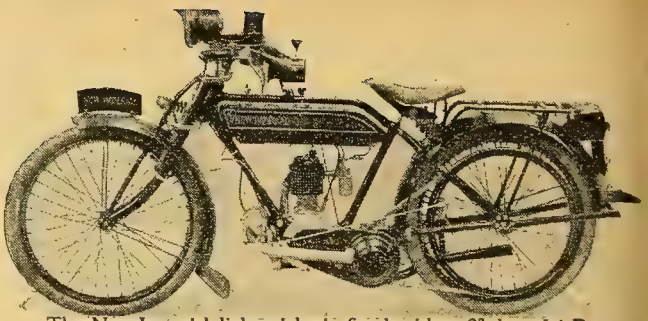
The 2½ Clyno is a noteworthy example of unit construction. The inclined cylinder contributes to the taking outline.



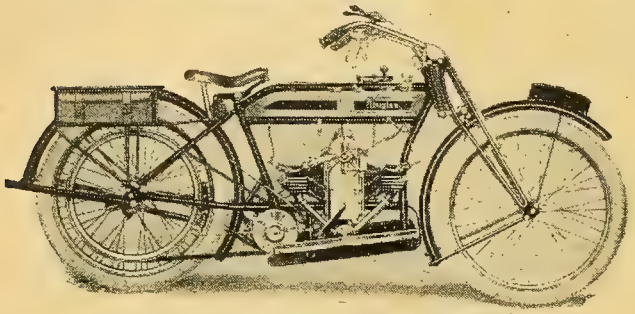
The Sporting Coulson-B has all the points that appeal to the fast long-distance solo man.



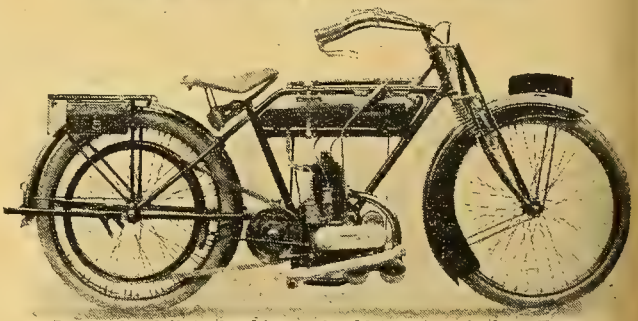
The 2¾ h.p Diamond-Jap is a typical example of the heavier go-anywhere lightweight.



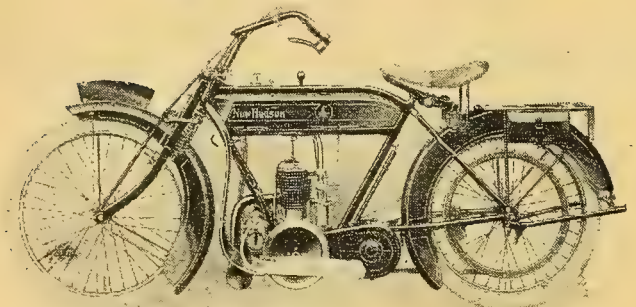
The New Imperial lightweight is fitted with a 2¾ h.p. J.A.P. engine and other equally well-known components



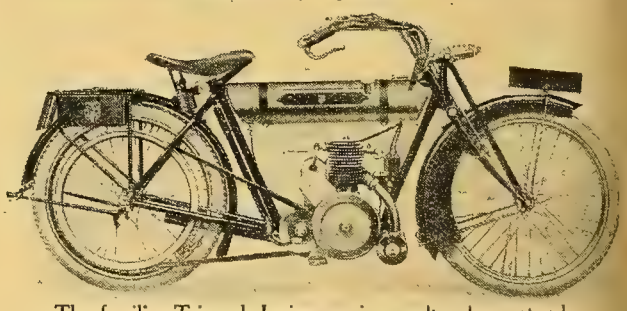
A three-speed model of the ever-popular Douglas Ample sized footboards are fitted



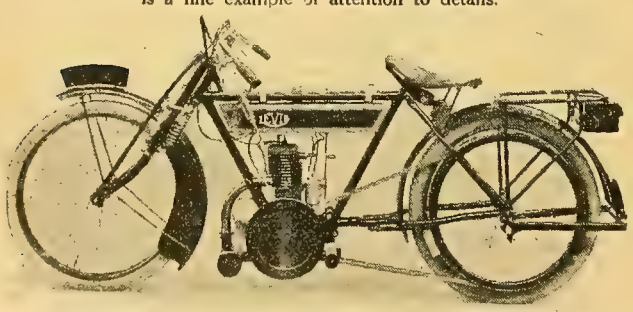
Conventional lines in this case make a very sound machine —the 2½ h.p. Sparkbrook.



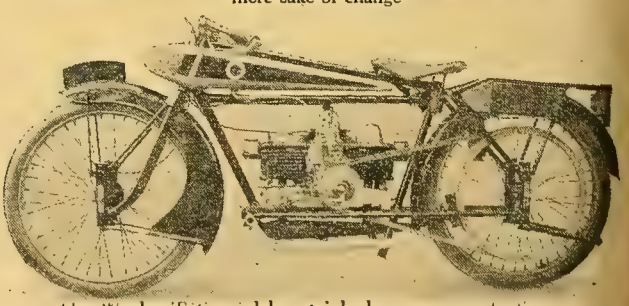
The product of specialisation, the 2¼ h.p. New Hudson is a fine example of attention to details.



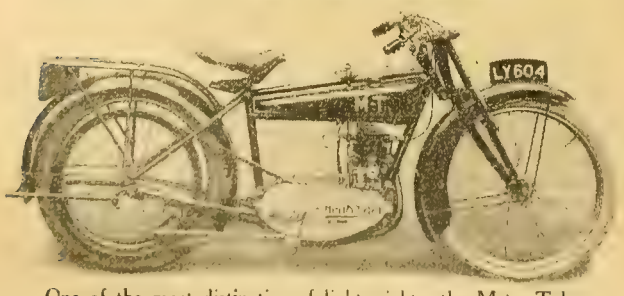
The familiar Triumph Junior remains unaltered—a natural sequence to the company's policy of never altering for the mere sake of change



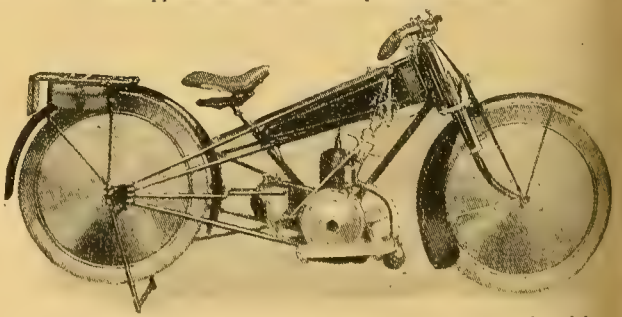
A pioneer amongst two-strokes—the 2¼ h.p. Levis; and probably the simplest machine of its type on the market.



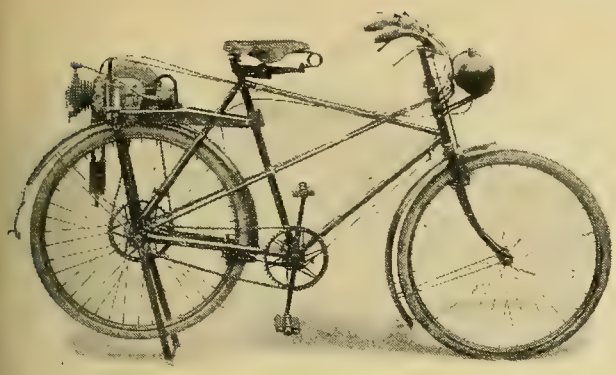
The Wooler T.T. model certainly has very speedy lines and appearances are not deceptive in this case.



One of the most distinctive of lightweights, the Metro-Tyler, is a decidedly taking little mount.



Triangulated frame construction is a feature of the Cotton lightweight



This specially adapted cycle with a Simplex attachment is sure to attract much attention on the Wolf stand.

Metro-Tyler.

Semi-unit construction of engine and gear box and specialisation to a degree help the Metro-Tyler to stand out amongst the *de luxe* types of lightweight. The very complete lubrication system uses in conjunction with crank case suction an Enots automatic feed, with a hand pump for emergency use. Roller and ball bearings are used throughout the two-stroke engine. Black enamel is the standard finish, but the more startling "all red" model is still obtainable. A three-speed gear box is supplied instead of the standard two-speed box at a small extra cost.

New Hudson.

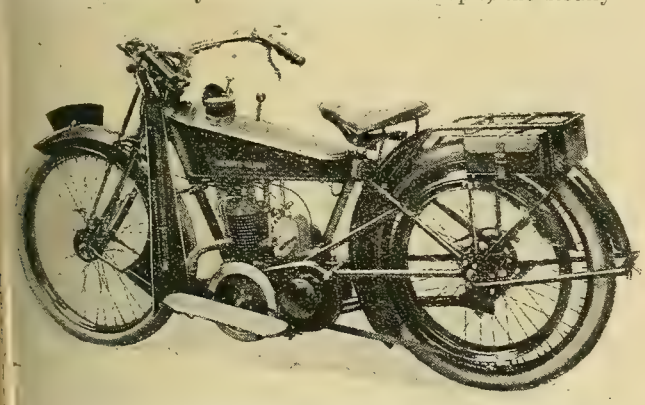
The New Hudson post-war policy of specialisation on their 2¼ h.p. two-stroke only has been amply justified by results. Both the two-speed gear box and the engine, a 62×70 mm. (211 c.c.) two-stroke, are designed and manufactured by New Hudson, Ltd., themselves, and the result is a very attractive and well-proportioned machine. Very noticeable are the extensive mudguards, neat chain cover, efficient and convenient rear brake, and fine finish generally of this popular solo mount. A sporting model, with T.T. bars and footrests in lieu of the standard footboards, differs only in detail.

New Imperial.

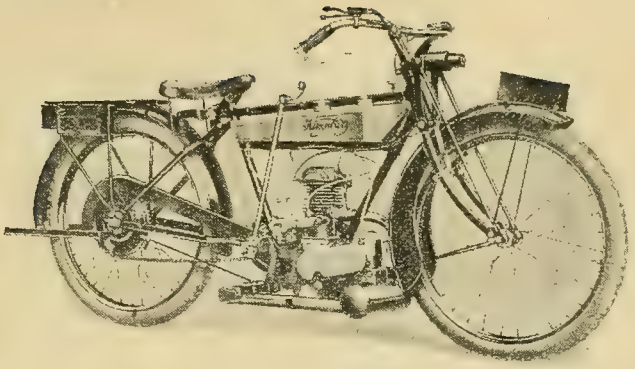
One of the most successful small four-stroke singles, the 1921 New Imperial-Jap, retains all the salient features which went to make its popularity in the past. A 70 × 76 mm. (292 c.c.) J.A.P. engine is now manufactured specially for this machine, but its lines are too well-known to need description. A two-speed gear box, with or without clutch and kick-starter, may be fitted. When without clutch, etc., the machine has semi-T.T. bars, but all models are equipped with large and strong footboards and an efficient mudguarding system.

Sparkbrook.

A Villiers two-stroke engine forms the power unit of all the Sparkbrook models, and some detail items of the machine are worthy of attention. For example, the stoutly



Two band brakes and the large filler cap give some indication of the care bestowed on Allon details.



A new spring fork and gear box are two Kingsbury improvements for 1921.

constructed heel brake operates a shoe *inside* the belt rim, thus facilitating wheel removal. A single large diameter bolt holds the Sparkbrook gear box or plain countershaft to a specially designed bracket. The choice of a Sturmey-Archer two-speed gear box, clutch, and kick-starter is also offered at option.

Triumph.

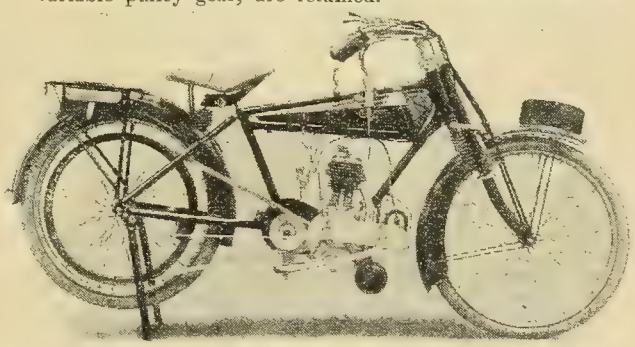
It may have been wondered why the Triumph Cycle Co. adopted the two-stroke principle for their lightweight when their 4 h.p. power unit has been so successful. The reason for this departure was that the two-stroke engine has fewer working parts, and it was possible to construct it more strongly on a small scale, thus outweighing any loss in efficiency; and the Baby Triumph amply justifies this contention. Next year's model is practically a replica of last year's, and it continues to uphold the company's reputation for extraordinarily good detail work. Perhaps the chief feature of the design is the handle-bar controlled gear change.

Wolf.

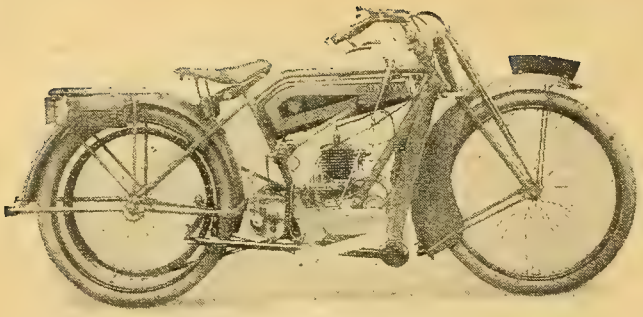
The lightweights proper of the Wolf range remain as in 1920. They consist of a 2¾ h.p. Blackburne engined model, with Sturmey two-speed gear and kick-starter; a 2½ h.p. Villiers two-stroke, with either plain gear box or clutch and kick-starter; and a 2¾ h.p. J.A.P., also with a choice of gear boxes. But great interest will undoubtedly centre around the duplex frame cycle with 1 h.p. Simplex power unit on a special rear carrier. A lady's machine of this type will also be on show, and should attract many newcomers of the fair sex to the pastime.

Wooler.

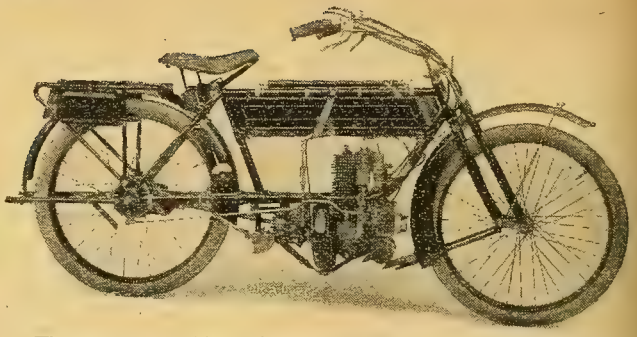
A flat twin that departs from the conventional in many respects, the 2¾ h.p. Wooler, has made quite a name for itself at Brooklands. 1921 improvements were fully dealt with in our issue of October 28th, but we may recall the salient features, which include a new inlet dome, an improved crank case release which traps all surplus oil for further use, and enlarged toolbags. The distinctive 60×60 mm. (345 c.c.) flat twin engine, front and rear springing, and variable pulley gear, are retained.



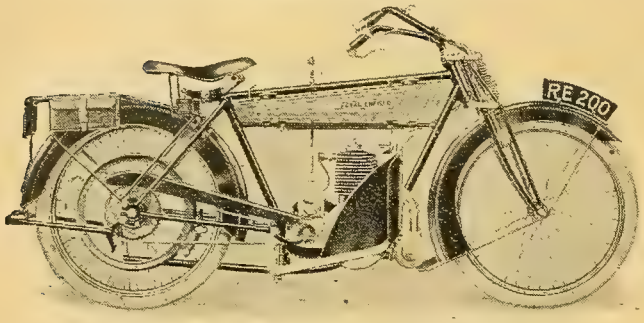
A combination of two well-known names, the Calthorpe-Jap lightweight.



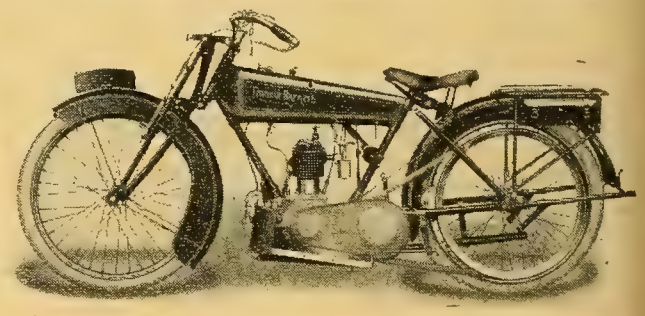
The 2½ h.p. Ivy, which has been retained in addition to the newer 3 h.p. model.



The unconventional but well tried features of the F.N. lightweight remain unaltered. A de luxe model, however, is now marketed.



The leg-guards on the Enfield two-stroke protect the rider both from the flywheel and from splashed-up mud.



A clean tank and partially concealed control wires add considerably to the appearance of the Francis-Barnett.

Allon.

There is one point on the Allon lightweight of which the makers may claim to be the pioneers: that is, the sloping top tube, which is now gradually becoming universal throughout the trade. The 292 c.c. two-stroke engine is in some respects unconventional; for instance, the cylinder and upper half of the crank case is a one-piece casting. Band brakes are fitted to both the front and the rear wheels, and a strong two-speed gear box, clutch, and kick starter are housed at the bottom bracket. A three-speed gear box of their own manufacture is provided on another model specially intended for light sidecar work.

Calthorpe.

Calthorpes for 1921 will be made with either two or four-stroke engines. Cycle and transmission details are very similar in both cases. An Enfield gear is also fitted to both models, the final drive being by belt. A 75×79 mm. (2¾ h.p.) two-stroke with a special direct drip feed lubrication or the well-known 2¾ h.p. J.A.P. four-stroke supply the power. A light two-stroke sidecar outfit differs only in the gear—a Sturmey-Archer two-speed box with clutch and kick-starter.

Cotton.

Frame construction on scientific lines is a special feature of the Cotton, and, of course, has been retained for next year. This triangulated construction, in addition to its inherent advantages, provides a very handsome appearance. A 2½ h.p. Villiers (flywheel magneto) engine now replaces the conventional two-stroke hitherto used, and an Xl'All pan saddle attends most efficiently to the comfort side of the specification. A plain two-speed gear box is standard, but a clutch and kick-starter may be fitted at a slight extra cost.

Enfield.

A kick-starter is now an optional fitment to the Enfield two-stroke, and large leg shields, acting both as a protection from mud and from the engine and flywheel, are attached to the footboards. Naturally the other features that helped to make this machine so successful in 1920 have been retained, including the Enfield gear and cush drive. Needless to say, the detail work and finish are of the usual high quality associated with the familiar slogan of "Made like a gun."

F.N.

Unconventional to a degree, yet the proved embodiment of many years' manufacturing experience, the 2½ h.p. F.N. has not undergone any drastic alteration since last show. A transversely set engine, two-speed gear, and final shaft drive are features, combined with exemplary workmanship, that have made the F.N. lightweight famous. However, an extra model will be shown at Olympia which has a dropped top tube and footboards. Detail improvements to the engine have moved the makers to increase their rating to 2¾ h.p.

Francis-Barnett.

De luxe detail work and finish distinguish the Francis-Barnett from many lightweights of similar specification. Very few modifications have been made for 1921: but, by concealing the control wires between the sides of the saddle tank, a much cleaner appearance generally is gained. A 70 × 76 mm. (292 c.c.) two-stroke engine supplies the power to a two-speed constant mesh gear box, which includes clutch and kick-starter, and thence to the rear wheel by belt. A J.A.P. engined machine with M-L lighting set will also be shown.

Hobart.

The Hobart Cycle Co., an old established Coventry cycle firm, offers a wide range of lightweights for 1921. A Villiers (flywheel magneto) engine is fitted to the standard single-geared machine, which model may also have a Chater-Lea two-speed gear box. The *De Luxe* model is a very fine little machine. Either a 2¾ h.p. J.A.P. or 2½ h.p. Villiers engine may be fitted at option; and particularly interesting points are the braking—improved rear and special dummy belt rim in front—ample mudguarding, belt guard and under-shield, and an extension to the exhaust pipe. The well-known and tried Hobart spring frame is optional with the latter two models.

James.

The James two-stroke engine is now 66 × 70 mm., giving a capacity of 239.5 c.c., as compared with 226 c.c. hitherto. And comfort as well as power has been increased by the provision of a specially adapted Lycett saddle, with a flexibly spring peak. The Brampton forks have also been modified, with a resultant improvement in steering. Indeed, the whole design has been "cleaned up" since Olympia, 1920, leaving the James quite in the front rank of its type.

GREAT SUCCESS OF NEW PELMAN COURSE.

Interesting Secrets of Business Psychology Explained.

THE public is giving a great welcome to the New Pelman Course.

From every side and from men and women of every rank and occupation letters asking for particulars are pouring in.

It is already evident that the popularity of the New Course will exceed even that attained by the Course which produced such remarkable results during the war.

This increased popularity is fully justified, for everyone agrees that the New Course is a great improvement on the old one. Indeed, the well-known journal "Truth," which has carefully examined both, is of the opinion that the New Pelman Course is "100 per cent." better than the former one.

This improvement is largely due to two facts:—

1st: The New Course is based on the unique experience gained in training the minds of over 500,000 men and women of every type, age, position, and occupation.

2nd: The New Course embodies the results of important discoveries recently made in the Science of Psychology.

An interesting book, containing a full description of this greatly improved and enlarged system of scientific Mind-Training, together with a reprint of the important Report issued by "Truth" on the New Pelman Course, can be obtained, gratis and post free, by any reader who writes for it to-day to the Pelman Institute, 199, Pelman House, Bloomsbury Street, London, W.C.1.

The New Habit.

Thousands of men and women are spending delightful evenings at home this winter with the "Little Grey Books" issued by the Pelman Institute.

They are wonderful little books, these. Everyone who has read them says so. And those who have not yet had the opportunity of reading them little realise how much genuine pleasure, as well as profit, can be derived from these Home Guides to Scientific Mind-Training.

"Pelmanism," says Miss Lillah McCarthy, "is now my Sunday recreation. I take a dose of this new mental tonic, and at once experience a sense of rest and content. After this pleasant exercise I feel braced up, ready for my week's work, and sure that I shall be able to do my best. That is the secret I have learnt from Pelmanism—it makes you do your best; and, moreover, it makes your best better than you thought it possible to be. I am now a Pelman enthusiast, and am prescribing my remedy wherever and whenever I encounter a friend who would be better for it—here are many who would.

An Absorbing Game.

"And," she adds, "Pelmanism is a most absorbing game, and one which each player can learn for himself or herself. At any convenient moment one may take up the 'Little Grey Books,' and enjoy real mental recreation—to employ that much-abused word in its proper sense. In my experience, Pelmanism does more than educate in the ordinary sense of the term. It re-creates the mind, fills one with a new energy for work, stimulates one to a greater determination of will-power, and increases the capacity for concentration."

Thousands say the same. Pelmanism is being practised everywhere. It is the new Habit, and a very fascinating and profitable Habit, too. It is just the thing for the long Winter evenings. Write to the address printed on this page and see. Full particulars will be sent you gratis and post free.

The Personal Test.

The best test of any system of Mental Training is the personal one.

Many thousands of men and women have made this personal test of the Pelman System and have reported the result to the Institute.

Here are a few extracts from their letters, in which they report the results they have secured from the Pelman Course.

"I doubled the turnover of my department last year."—MANAGER.

"Your Course has quickened the pulse of my vitality."—BARRISTER.

"My income has gone up 300%."—ARCHITECT.

"The Course has been of great help to me."—ADMIRAL.

"I attribute my success mainly to the results derived from your excellent Course. MANAGING DIRECTOR.

"Secured a net increase of salary of 400%."—EX-CAPTAIN.

"More confidence, memory improved, greater interest in business."—SALESMAN.

"Delighted with my progress, both monetarily and mentally."—TECHNICAL MANAGER.

"Can do my sermons better. Have gained confidence in extempore preaching."—CLERGYMAN.

Salary Quadrupled.

"I have improved 300% in salary."—CLERK.

"Have got exceedingly good value out of the Institute."—MAJOR-GENERAL.

"I benefit to the extent of £1,000 this year."—IMPORTER.

"Since taking up the Course, I have more than trebled my income."—CLERK.

"I have secured three increases of salary in five weeks."—BRANCH MANAGER.

"Since starting I have made three moves upwards in our works."—CLERK.

"Recently received a rise in salary of £200 a year."—ELECTRICAL ENGINEER.

"Self-consciousness eliminated. Promotion secured."—MANAGER.

"A little over 100% increase in income."—ARTISAN.

"Have succeeded both in position and salary far beyond my 'pre-Pelmanism' dreams."—LIEUTENANT.

"Have gone on from one success to another."—CIVIL SERVANT.

"I have more energy, can acquire fresh knowledge more readily and pleasantly, and can recall and use previously-acquired knowledge more easily and more extensively."—DOCTOR.

"The firm I work for advance their employees according to age, but I have been promoted till I am next to the manager at our branch. I have four men working under me. Ever since I took up the Pelman Course my work has been a pleasure."—GROCER'S ASSISTANT.

"I have been able to procure this appointment simply and solely through your books."—TELEGRAPHIST.

"Eleven months after taking up your Course finds me a different man. Concentration has been gained, my memory has been improved from moderate to good, and all my perceptions greatly strengthened. Your Course is one which is suitable for persons of all temperaments, and, apart from all monetary gains, it gives that developed mentality and personality which is beyond price."—JOINER'S APPRENTICE.

"I began this Course after I had been out of the Army about a month, and it was just what I required. I know what I want out of life now, and intend to get it. I have gained greatly in Self-confidence. A noted improvement all round. I am thankful I have taken the Course. The second lesson (Interest Power) is worth the money charged for the whole Course."—BUYER.

And many more similar instances will be found in the literature you can obtain to-day, free of cost, by writing to the address printed below.

What the Course Does.

The New Pelman Course develops the qualities most needed for success in every career.

By means of this system you can quickly and permanently eliminate all such weaknesses as—

—Forgetfulness,	—Mind Wandering,
—Brain Fag,	—Indecision,
—Dullness,	—Shyness,
—Timidity,	—Weakness of Will,
—Lack of System,	—Lack of Initiative,
—Indefiniteness,	—Mental Flurry,

and at the same time develop such valuable qualities as—

—Concentration,	**—Perception,**
—Observation,	**—Initiative,**
—Will-Power,	**—Decision,**
—Ideation,	**—Resourcefulness,**
—Organising Power,	**—Directive Ability,**
	—Forcefulness,
—Self-Confidence,	**—Driving Power,**
—Self-Control,	**—Tact,**
—Reliability,	**—Rightly Directed Energy,**
—Salesmanship,	**and a Reliable Memory,**

that are indispensable to every man or woman who wishes to "make good" in any sphere of life.

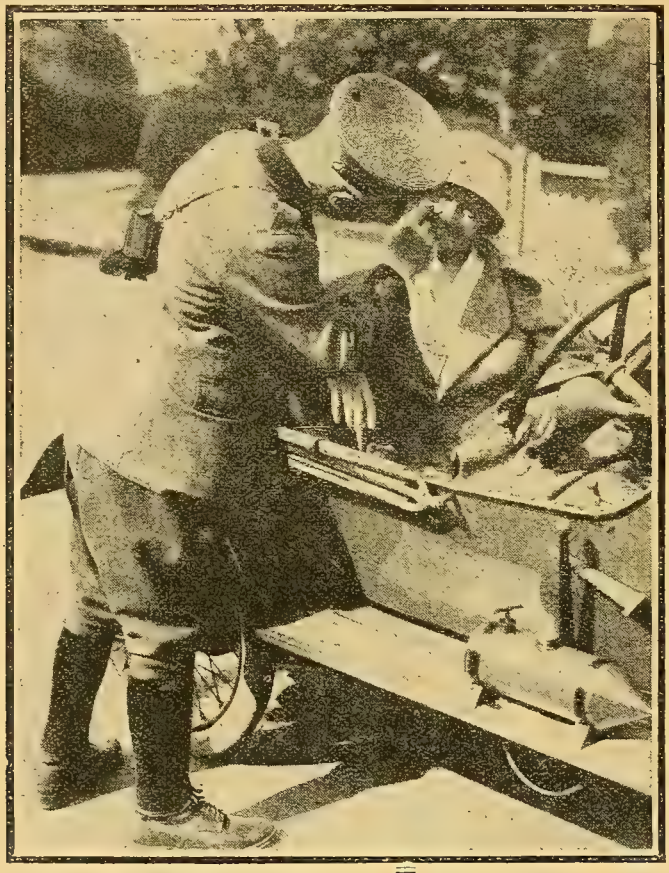
To you, whatever your profession or occupation, the Pelman Institute will send, free of charge,

(1) A copy of "Mind and Memory," containing a full description of the New Pelman Course;

(2) A Reprint of the latest Report issued by "Truth" on the Pelman Institute;

(3) A form entitling you to enrol for the full Course at a reduced fee.

Write for the above to-day to the Pelman Institute, 199, Pelman House, Bloomsbury Street, London, W.C.1 (or call at the Institute), and by return you will receive the latest information concerning the famous system which, doing so much for others, will do the same for you.



A.A. Benefits.

1. The Patrols.

HUNDREDS of khaki-clad patrols traverse thousands of miles of main road seven days a week for fifty-two weeks in the year.

The patrols are fully acquainted with all local road conditions, are competent to undertake minor roadside adjustments will obtain spares or motor fuel when necessary, and are at the service of members always.

A.A. Road Service also includes roadside telephone boxes, roadside motor fuel supply stations, "mechanical first-aid machines," home and foreign touring facilities, free legal defence and advice, engineering assistance, A.A. hotels, officially appointed repairers, together with other advantages which enable members to motor with comfort, safety and economy.

If you are not already a member of the Automobile Association, send a postcard to-day to the Secretary, 21, Fanum House, Whitcomb Street, London, W.C.2. for a free copy of "The Key to the Open Road," which shows how membership will benefit you personally.

ALWAYS AT YOUR SERVICE

In answering this advertisement it is desirable to mention "The Motor Cycle."

Review of 1921 Lightweights—

J.E.S.

One of the simplest machines at the Show, the J.E.S. is sure to attract much attention, both by this very simplicity and by the clever design displayed in its tiny power unit of 146 c.c. (1 h.p. nominally). A new and more conventional carburetter now displaces the old floatless type, but other details remain unaltered. Although the unit is designed to fit into an ordinary cycle frame, the makers prefer to sell it as a complete miniature, with spring forks, etc. A 2 h.p. model on the same lines will be another feature for the 1921 market.

Motorped.

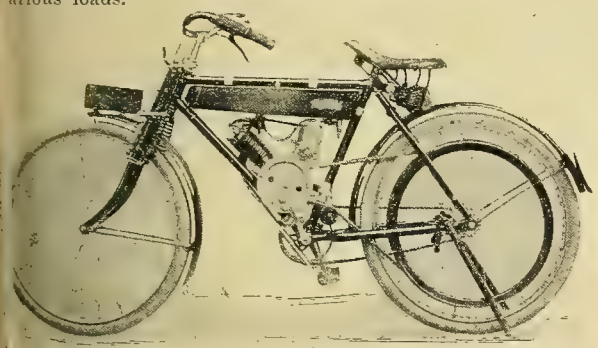
The makers of the Simplex cycle attachment are making a complete range of cycles so fitted, under the name of Motorped. The outfit may be obtained with or without a multi-plate clutch, and the cycles in all cases are simply strong ordinary pedal machines. A photograph of a lady's bicycle fitted with one of these engines is illustrated elsewhere.

O.K.

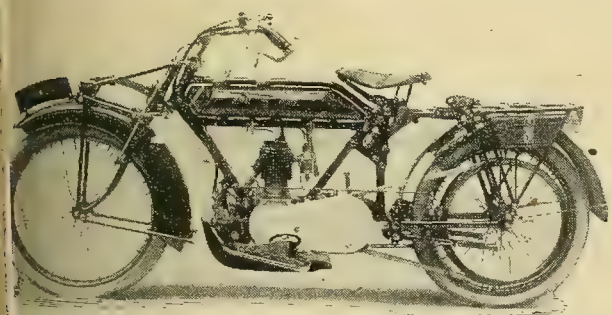
A change in the colour scheme—now a rich terra-cotta red—makes the 1921 O.K. strikingly attractive. This impression is furthered by a lower frame and more cleanly designed tank. The well-known 48 gns. O.K. is now offered with a choice of three engines: either a 2¼ h.p. O.K., a 2½ h.p. Villiers, or 2¾ h.p. O.K. Several detail improvements have been carried out, including a stronger carrier, an improved method of carrying the rear number-plate, and an extra spring to the front forks. An entirely new model has a 269 c.c. Villiers magneto-flywheel engine, footboards, and an Albion two-speed gear box, either with or without clutch, and kick-starter.

Royal Ruby.

Coming as it does under the 350 c.c. limit, the Royal Ruby must be regarded as a lightweight, although as a matter of fact it has been designed more as a comfortable go-anywhere solo mount. Transmission is by chain to a two-speed countershaft gear, with clutch and kick-starter, and thence by belt to the rear wheel. The front and rear springing is similar to the larger Ruby machine, and it is made throughout, including the engine, by the Ruby Cycle Co., Ltd. A feature of the springing system is that it is adjustable for various loads.



The smallest four-stroke, and probably the lightest machine at the Show—the J.E.S.



Comfort is a first consideration with the Royal Ruby. The springing system is of special design.

Velocette.

1919 and 1920 Six Days successes have proved that the Velocette is a dangerous competitor to machines three times its 220 c.c. capacity. A three-speed model, similar to those which constituted the A.C.U. team, will be marketed for 1921 in addition to the former two-speed type. This new model also embodies an internal expanding front brake, rather an advanced feature for a lightweight but none the less commendable. The offset cylinder, patent gear change, and other distinctive Velocette features have been retained. The lady's model is an exceptionally taking machine, having a very low open frame.

Victoria.

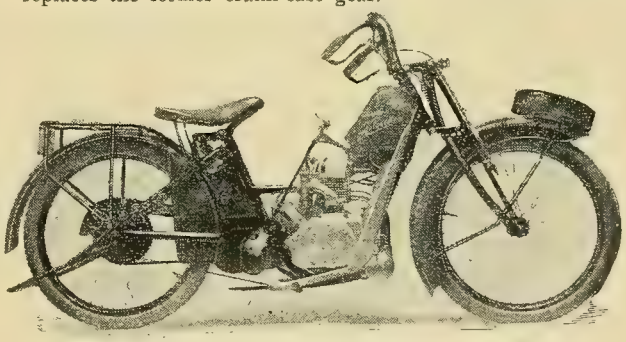
The only Scottish firm exhibiting at Olympia are the Victoria Motor and Cycle Co., of Glasgow, and the well-known components embodied in their lightweight should appeal to visitors from both sides of the Border. A 2½ h.p. Villiers (flywheel magneto) engine, Albion two-speed gear, and Brampton Biflex forks, are all too familiar to describe in detail. A soundly constructed little machine is the result.

Vindec.

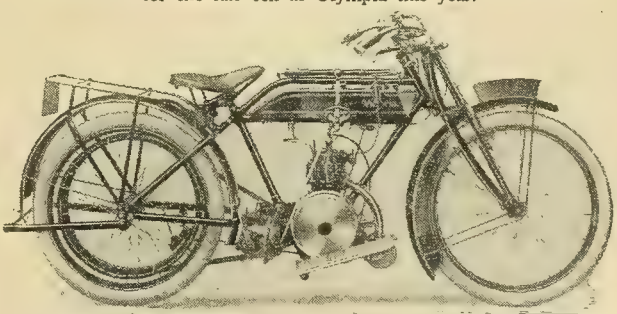
We described the 1921 Vindec in our issue of November 4th. To recapitulate, however, this product of the well-known accessory firm, Messrs. Brown Bros., has a specially designed 64×70 mm. (226 c.c.) two-stroke engine, the lubrication of which is carried out by hand pump. Distribution of the oil is effected by three pipes leading to the two main bearings and the induction pipe respectively. An all-black finish and a very neat primary and magneto chain cover are two serviceable items. The transmission of this machine is unusual in that two separate chains (high and low gears) drive the countershaft; final drive is by belt.

Paragon.

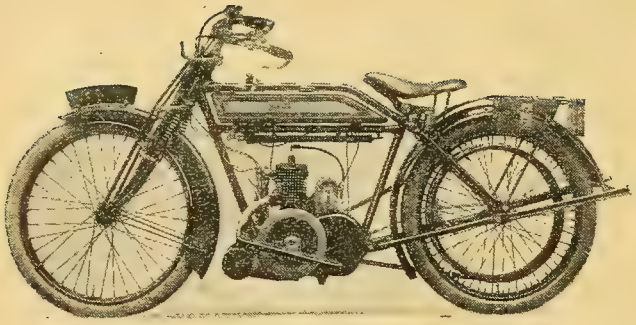
The Paragon is a good example of the moderately priced large capacity two-stroke, with the addition in this case of a simple spring frame. An improved system of lubrication has been introduced for 1921, but otherwise there is little alteration. The oil enters by suction at the foot of the cylinder, and is thence led direct to the crankshaft which is hollow, thus lubricating the big end internally. An Albion two-speed gear box, clutch, and kick-starter replaces the former crank-case gear.



This ladies' model Velocette should be a centre of attraction for the fair sex at Olympia this year.



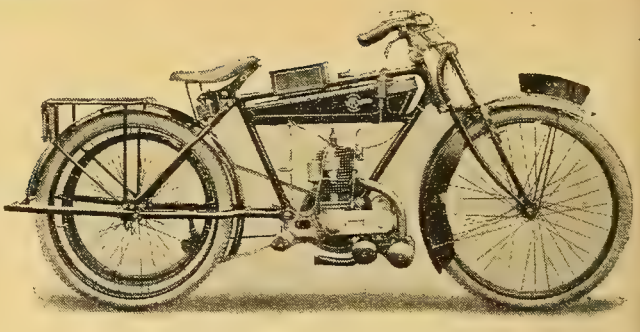
From across the Border, the Victoria has not been scamped by the use of inferior components.



A special system of lubrication is a novel point on the 1921 Vindec.

Ivy.

Including a lady's and a light sidecar machine, there are no fewer than two Ivy models for next year. However, these may be condensed to two distinct types, viz., a 2½ h.p. two-stroke and a 3 h.p. two-stroke, which has distinguished itself so much on the Old Wyche, Malvern. The lady's model is a 2½ hp. two-stroke, and the three other machines with this engine are the usual range of single-speed, two-speed, and two-speed clutch and kick-starter. The 3 h.p. machine may be obtained with and without a Sturmey two-speed gear box and clutch, and similarly equipped as an I.O.M. sporting model. A 3 h.p. machine with a special light sidecar completes the list. The latter outfit will be



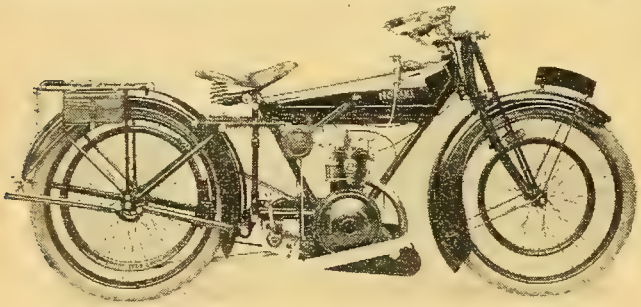
The Villiers-engined O.K. is an attractive mount, both in appearance and workmanship

Beaumont.

A two-stroke (2¾ h.p. Wall) and a four-stroke (2¾ h.p. Blackburne) engined machine will be shown by Beaumont Motors (Leeds), Ltd. The former has a Roc plain two-speed gear box, while the latter, which is more in the nature of a *de luxe* model, has a Sturmey-Archer countershaft box with clutch and kick-starter. Internal expanding and external contracting foot and hand brakes respectively are fitted.

Wilkin.

Already a really serious solo touring proposition, the 2¾ h.p. Wilkin, with Blackburne engine, is now offered as a "go-anywhere" sidecar machine. Totally enclosed chain drive

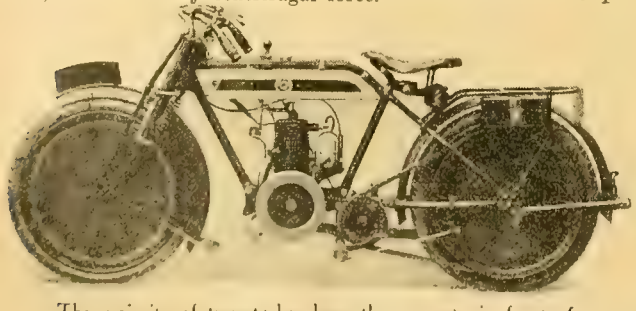


The very complete spring system of the Hobart lightweight gives it an attraction of its own.

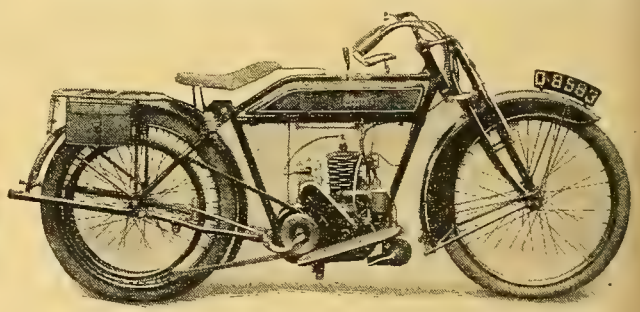
Verus.

geared six to one on top and eleven to one on bottom, and it is claimed that it would have to be an exceptionally severe hill that it would not be able to climb on low without shedding the passenger.

The Verus has continued its career of successes in some of the most arduous trials of 1920, a very commendable performance for a machine which has been only comparatively recently introduced to the public. The 2¼ h.p., 2½ h.p., and 2¾ h.p. models are retained, the latter having a Blackburne outside flywheel four-stroke engine. The lubrication on the two-stroke machine is very thorough, and is worthy of special attention. A Best and Lloyd drip feed controls the flow of oil first to the base of the cylinder, then dropping into a well at the top of it is led to the main bearings. The big end is lubricated by centrifugal force.



The majority of two-strokes have the magneto in front of the engine. However, on the Radco, this vital part is well protected.

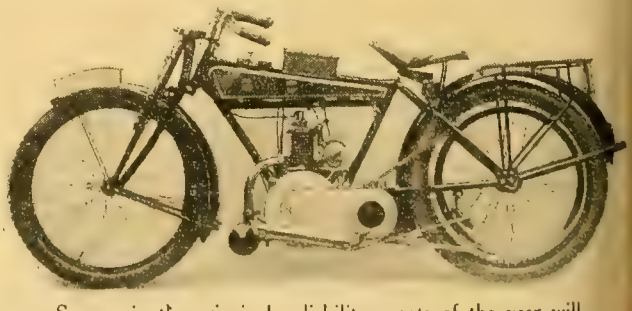


A larger engine, modified spring forks and an exceptionally comfortable saddle, are the James points for 1921.

from a three-speed Sturmey-Archer gear box, and sidecar lugs incorporated in the frame, are advanced lightweight features; but, as already indicated, the Wilkin has been built for efficiency and comfort, and not primarily light weight. A sports model is built on the same lines with the substitution of T.T. bars and chainguard for touring cars and chain cases.

Radco.

One of the early lightweights, the Radco, must undoubtedly derive benefit from the long experience of the makers with this type of machine exclusively. Only one engine is still the policy—commendable in many ways—of this company, but four distinct models will be marketed next year. The engine has been increased from 2¼ h.p. to 2½ h.p. Electric lighting sets are optional.



Success in the principal reliability events of the year will have the natural sequence of interest in the Verus machine The 2½ h.p. two-stroke model,

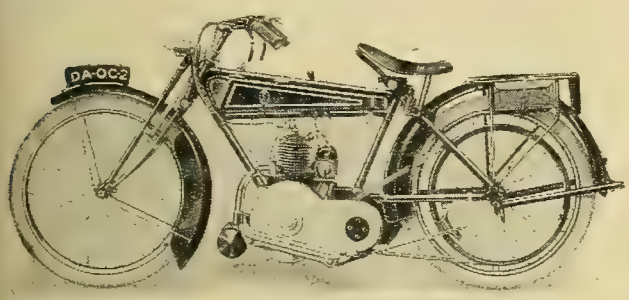
Review of 1921 Lightweights.—

Olympic.

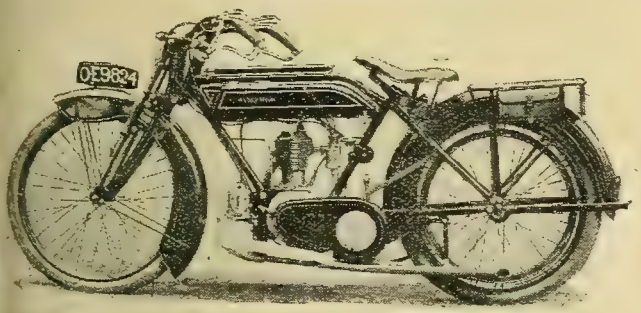
An Orbit three-port, two-stroke engine of 261.5 c.c. forms the power unit of the Olympic lightweight. The flywheel and primary chain are totally enclosed in a neat aluminium cover, and either a plain two-speed gear box or the same with clutch and kick-starter may be fitted at option. A very ingenious swinging bracket provides easy adjustment for the primary chain, quite one of the most useful detail improvements of the year. Gosport spring forks are fitted, pending the introduction of a new type of Olympic manufacture.

Connaught.

The most inexpensive of the several Connaught models for 1921 is a single gear machine with 24in. wheels. Like all Connaught machines, it will have a standard engine, which has the inlet port immediately underneath the exhaust. Other variations of this pattern are equipped with the Albion two-speed gear box or the Sturmey two-speed gear box and kick-starter, a handsome chain cover being fitted. The lightweight sidecar outfit, which gave such satisfactory results in our hands during the summer months, is fitted with a new type of body provided with a locker under the seat.



A new and very neat method of gear box adjustment will be found on the Olympic two-stroke.



The J.A.P. engined model of the Massey-Arran.

Cedos.

The Cedos 2¼ h.p. (211 c.c.) machine which caused so much favourable comment at the last Show is being retained. It will be recalled that this model simply bristled with simple but useful innovations, such as easily adjusted primary and magneto chains, an undershield integral with the frame and extending to the rear mudguard, and a very complete lubrication system. The two-stroke engine (which has roller main bearings) and the gear box are both of Cedos manufacture, as, in fact, is more of the machine than is at all usual. In addition a 247 c.c. model will be marketed next year; and a real novelty—a lady's sidecar outfit also with the larger engine, two-speed gear, clutch, and kick-starter.

Edmund.

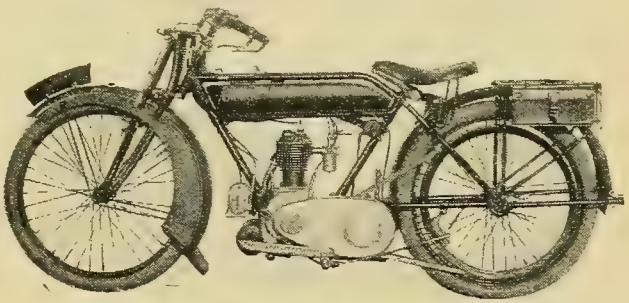
The Edmund adjustable spring frame has now been before the public for a considerable time, and has reached a stage where the makers do not find it necessary to modify their design yearly. Two J.A.P.-engined machines differ only in type of gear—an Enfield and a Burman two-speed respectively. All-chain drive is fitted in the former case. The heavier machine is fitted with a 2¾ h.p. Blackburne engine and Burman two-speed gear, clutch and kick-starter.

Hoskison.

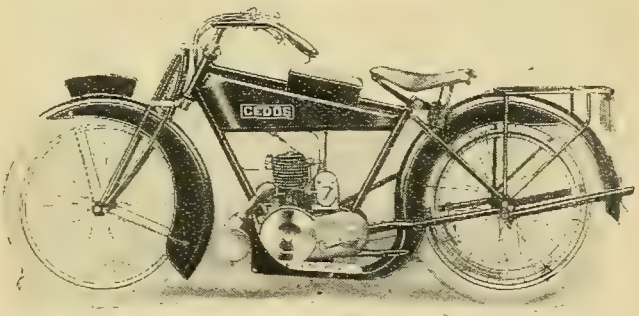
This make was one of the newcomers at the revival of the motor cycle industry at the beginning of 1919, and entered the field with a Union-engined two-stroke. Since then, however, the machine has been developed into a larger tourist type with a 2¾ h.p. Blackburne engine, and the models at Olympia will be of this type.

Omega.

A more extended range of models than hitherto will be offered by the makers of the Omega motor cycle. In addition to the well-known Omega-Jap which, during 1919 and 1920, became a very popular mount, a new two-stroke range will be offered both as a single-speed and gear box model. This will be fitted with the Villiers engine with flywheel magneto and Gosport spring forks, but otherwise following the lines of the J.A.P.-engined machine. Good machines at a popular price will be the keynote of the 1921 Omega policy. Several detail improvements have been made: the side valances of the front mudguards are now extended to the tip of the guard, and are carried to the outside of the fork members. Brampton forks will be standard on the J.A.P. model, which will be supplied with two-speed gear with or without clutch and kick-starter.



The 1921 Omega-Jap. A light weight marketed at a competitive price.



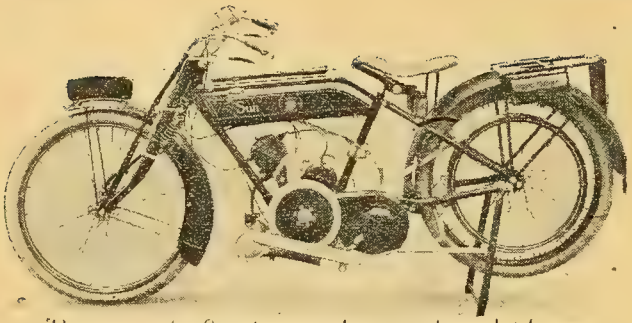
The Cedos possesses all the natural advantages of a machine made almost entirely under one roof.

New Scale.

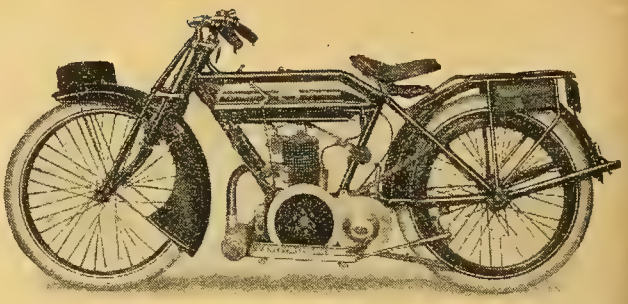
Primarily designed for solo work the New Scale is quite adequate for light sidecar work, the makers' rating of the engine being 3 h.p. The method of lubrication is interesting. From a sump in the engine the oil is fed in by the magneto chain. A very large and efficient silencer is fitted by the makers in place of the more usual types. Brampton Biflex forks coupled with a pan saddle, and heavy tyres, all tend to a maximum of comfort.

Dot.

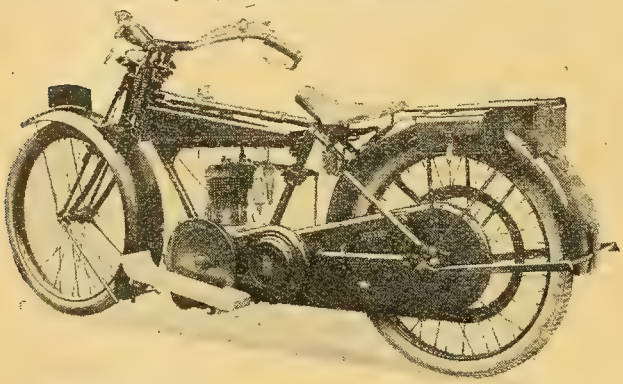
A neat and graceful layout, embodying standard components, has always been the speciality of Messrs. H. Reed and Co., of Ellesmere Road, Manchester, and this reputation is not neglected in the new models which will be seen at Olympia. One of these will specially appeal to the sporting clubman, since it is fitted with a 2¾ h.p. o.h.v. J.A.P. engine, from which power is transmitted by chain and belt through a two-speed and clutch gear box. No kick-starter is fitted, and the machine comes out at something less than 200 lb. weight. It is a most attractive little mount, being most comfortable in riding position and splendidly finished in the characteristic Dot red. The standard models of this make will also be shown.



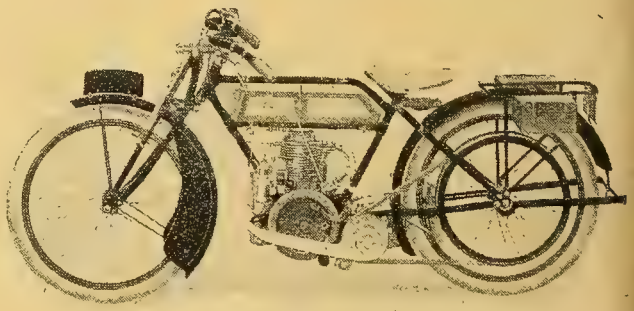
The two-stroke Sun has now been on the market for some years, with considerable success.



A machine which has made a name for itself in the lightweight world—the 2½ h.p. Connaught.



A very completely equipped lightweight—the 2¾ h.p. Wilkin, which has sidecar lugs incorporated with the frame.



A large vertical silencer is fitted to the New Scale lightweight.

Chater-Lea.

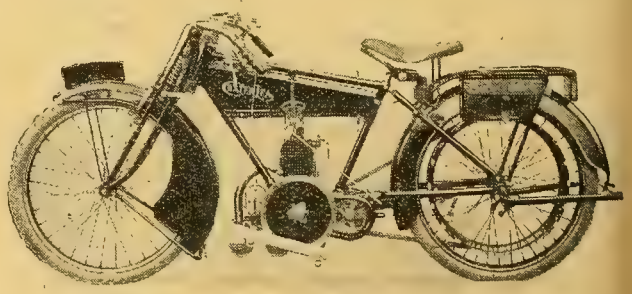
The practical little Chater-Lea lightweight will have platforms brazed on to the secondary frame member, which will carry the tank, thus considerably improving the general appearance. It will also be provided with a new two-speed gear box having an enclosed kick-starter mechanism. The engine is a 2½ h.p. Villiers, but the spring fork, like the gear box, is of Chater-Lea manufacture.

Massey-Arran.

A lightweight which first made its appearance last summer is the production of a new Birmingham firm, which is making highest quality and finish the keynote of its policy. Several models will be exhibited at Olympia, equipped with J.A.P. and Blackburne engines in which special attention has been paid to mudguarding and refinement in detail.

Sun-Vitesse.

The Sun is a neat two-stroke of distinctive design on account of its inclined cylinder. It is well made and finished, and offered in two types, *i.e.*, with a conventional frame and a Sturmey-Archer gear, having a clutch and kick-starter, and with a "cut away" frame for ladies. One of the features of the engine is that the crankcase is cast in one piece, and has a cover plate. Three machines of this make made a very creditable performance in the recent M.C. and A.C. Trial—the most severe one day trial of the year.



The Chater-Lea lightweight has a 2½ h.p. Villiers engine and a new two-speed gear box

MINIATURE MACHINES AT OLYMPIA.

Abbotsford.

"It stands by itself," is the slogan of the company who make this unique three-wheeled scooter, and it puts forward admirably the advantages of this type. Provision is made for a luggage carrier to take 1½ cwt., which allows of its use, either for light delivery purposes, or for domestic shopping. A clutch and hand-starter are fitted to the 2½ h.p. John four-stroke engine, the total weight is about 60 lb., and the price is £35. Laminated springs attend to the rear suspension

Whippet.

Scooters are necessarily unconventional machines, but the Whippet, with its aluminium cylinder and steel liner, carries the matter further. However, a successful year has not caused any drastic alterations, with the exception, perhaps, of the substitution of a cast iron piston—a sop to the novice and careless user. A new French carburetter, the Vici, is now fitted, and a simple exhaust valve lifter takes the place of the decompressor.

Autoglider.

A very wide range of Autogliders are offered for 1921. The standard model has no seat, but provides standing room for two. Very fully mudguarded, the De Luxe model, which has a large padded seat, should appeal especially to professional men and ladies. Two serviceable models for light delivery purposes have a carrying capacity of approximately 3 cubic feet; while the new sporting model is a unique partially streamlined machine, with a maximum speed, it is claimed, of 50 m.p.h.

Kenilworth.

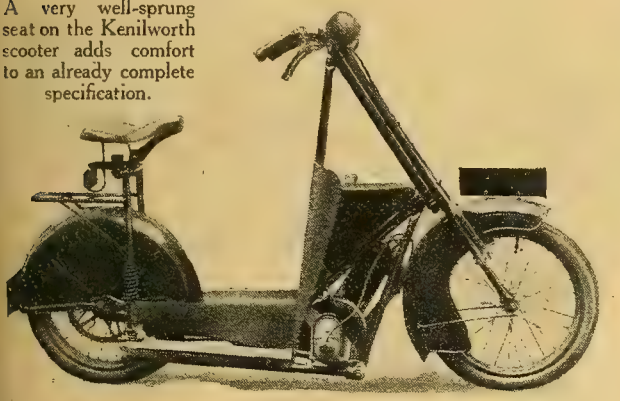
A very full description of the 1921 Kenilworth scooter appeared in our issue of April 29th, under the name of the G.S.C. Autocyclette. It is a very practical job, and has not been radically altered since its inception. Leg shields and a carrier have been added, and the frame has been modified. Chain adjusters on both rear wheel and countershaft are also a standard fitment, and the saddle standards are connected with the footboards, and suspended on springs.

Miniature Machines at Olympia—

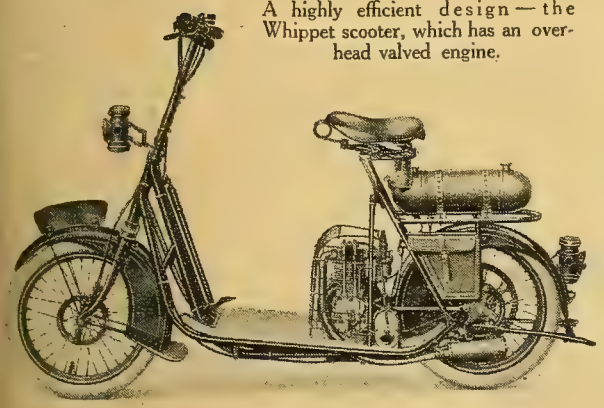
Skootamota.

Recognising their field of potential customers to have many varying requirements, the makers of the Skootamota have adapted their vehicle for several specific needs. For example, the light delivery machine has a large carrier basket in front and a box underneath the seat. The doctor's mount has a removable case, which may be readily detached and carried in the ordinary way. Mechanically, several modifications have been made, including an altered combustion head and a new single-lever carburetter designed by the makers.

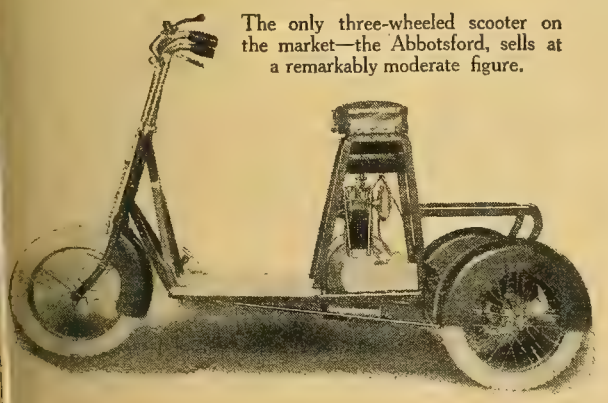
A very well-sprung seat on the Kenilworth scooter adds comfort to an already complete specification.



A highly efficient design—the Whippet scooter, which has an overhead valved engine.

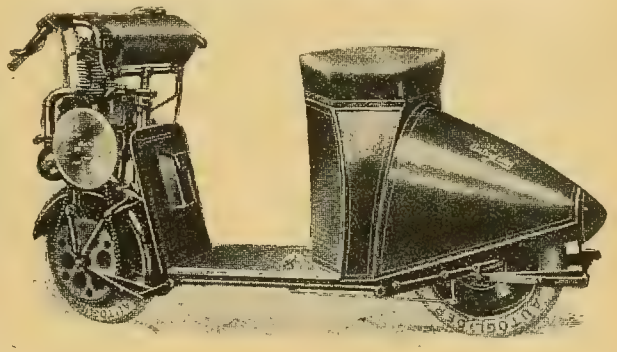


The only three-wheeled scooter on the market—the Abbotsford, sells at a remarkably moderate figure.

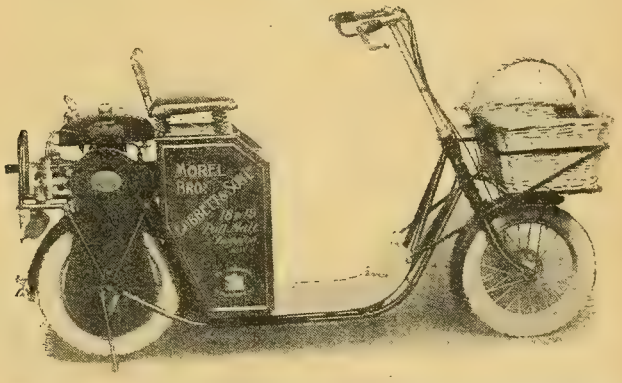


Unibus.

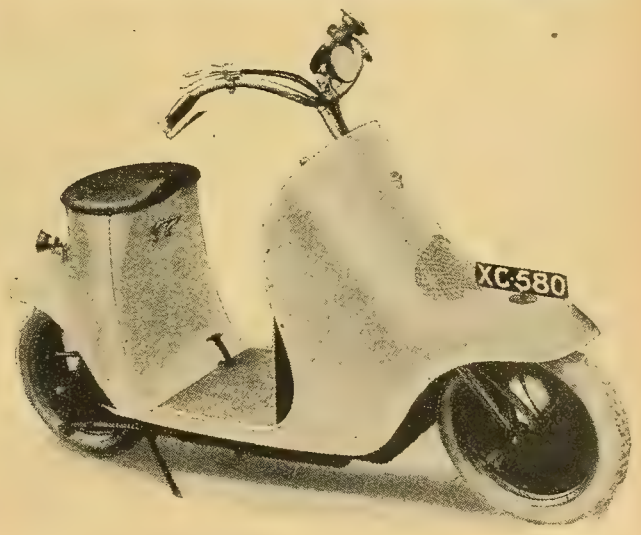
A scooter in a very limited sense only, the Unibus is in many respects more advanced than the average motor cycle. Ample protection and clean outline will make an appeal to the all-weather rider. A full description appeared in our issue of August 19th, 1920, but the more interesting points are worthy of recapitulation. A three-port two-stroke engine of 269 c.c., supplies the power to a Ferodo-lined dry plate clutch, thence to a two-speed constant mesh gear box, and by shaft to an underslung worm drive to the rear wheel. The brakes are also on car lines, and the springing system is very complete. The selling price, of course, is in accordance with the high potentialities of this machine.



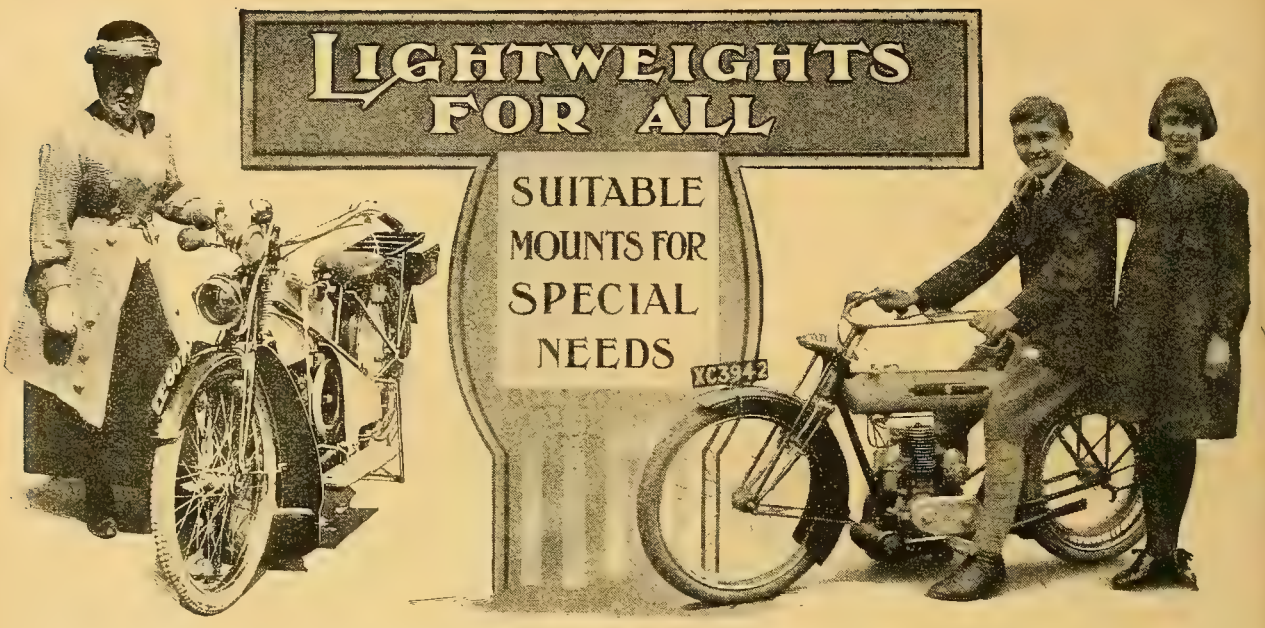
A sporting scooter—the Autoglider, for which a maximum speed of 50 m.p.h. is claimed.



The light delivery Skootamota which has ample goods accommodation.



A type of its own, the Unibus, has many exceedingly interesting details



IF every person over fourteen years of age realised the utility and reliability of the modern lightweight, there would be hundreds of thousands of them on the road.

As it is, their popularity increases year by year, and every one sold may be said to be a missionary to induce the sale of others. Boys, girls, men, and women in all stations of life use them in their various forms; and now that there is a type suitable for every individual requirement, the time is not far distant when they will be regarded as a necessary adjunct in every household possessing the necessary capital for their purchase.

Fifty pounds may be regarded as the present minimum price for a new lightweight machine, which represents about £25 on pre-war values. To some it may seem a lot of money, but there are thousands of the working class who annually spend this amount in seeking other pleasures for which they can see nothing at the end of the year. In purchasing a motor cycle, only the amount representing depreciation is lost, and for this the owner may have extracted more pleasure than the whole capital outlay spent in other directions.

However, it is not our purpose here to discuss this point, but to show how the requirements of the various classes of buyers may be fulfilled.

Novices—that is, newcomers to the motor cycling fraternity—may be divided into four classes—girls, boys, women, and men—but each does not require an entirely different type of mount. In many cases the machines which will appeal to the average girl are the same as will find favour with her mother. But the girl of to-day does not insist that her machine shall have an open lady's frame, although in most cases they prefer it.

In our present office, as advisers to all novices, we will first consider the school miss and her mother jointly, assuming that an open frame is regarded as a necessity. The first machine to be considered perhaps will be a motorised bicycle—say a lady's machine fitted with a Simplex or a Young auxiliary engine on the rear carrier. We recently tried one of these power units, and found the power developed capable of propelling the machine, without pedalling, over all roads where a lady cyclist would go.

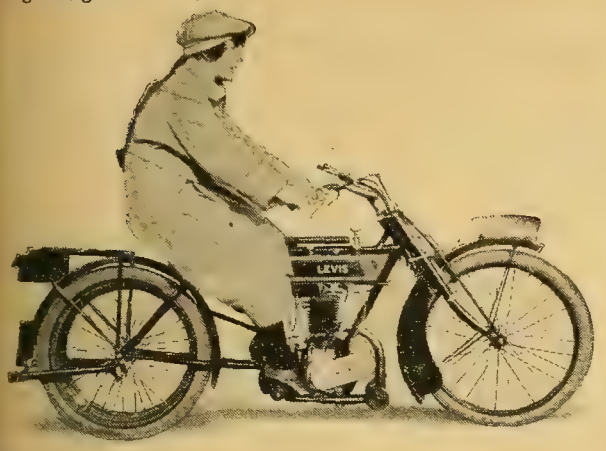
The step between the pedal cycle and the machine specially built to be driven by an engine, a Simplex-engined lady's bicycle.

The extra weight—about 20 lb.—on the carrier makes the handling of the machine when dismounted somewhat strange, but one soon becomes accustomed to it.

Next on the list would be the several excellent miniature motor cycles with open frames, which have been developed from the scooter, but, being fitted with a comfortable seat and having emerged from the experimental stages, may now be regarded as trustworthy little mounts of greater merit than is generally appreciated. In this group may be considered the Kenilworth—now a real 70 lb. motor cycle, the Skootamota, the Whippet, and Mobile Pup. Those desiring a spring frame machine miniature will be interested in the Autoglider, the Macklum, and the Unibus.

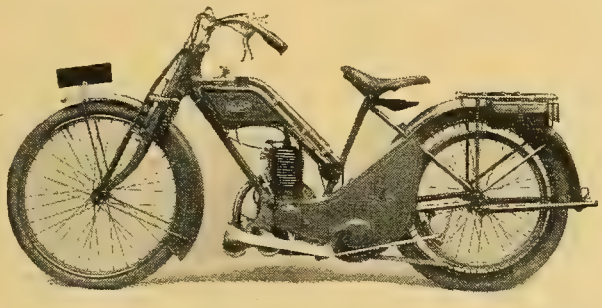
Fully equipped motor cycles with open frames are not so numerous as they might be. In this class we have the new Velocette, illustrated elsewhere, the Ixion, the Sun, and the Cedos—all with efficient two-stroke engines and two-speed gears. The Ixion and Sun have kick-starters and clutches.

Lightweights for All.—



A single-geared Levis, a model very popular with both boys and girls and very suitable for those who have not a great deal of traffic riding to do.

In the next category one may group together the requirements of the rest of girl riders (*i.e.*, those who will ride a machine with a "diamond" frame) and their brothers. The whole of the lightweight field seems to be open to these riders. On forty odd stands at the Show there will be machines fulfilling their requirements; and many of them will be offered in several types, that is, with or without gear boxes, with two-stroke and four-stroke engines, and ranging in size from 200 c.c. to 350 c.c. capacity.



A fully-equipped ladies' motor cycle, the Ixion, with special frame, clutch, kick-starter, and two-speed gear. The Velocette ladies' machine is illustrated on page 583.

For the youth or sporting girl, a single-geared two-stroke will be found quite satisfactory. In this group we have the Levis, O.K., Bown, Connaught, Diamond, Hobart, Ivy, Ixion, Olympic, Radco, Wolf, and Sparkbrook. Most of these machines may be obtained with two-speed gears, to which must be added the Allon, Armis, Alecto, Calthorpe, Coulson, Coventry Eagle, Cedos, Chater Lea, Douglas, Enfield, Hoskison, Francis-Barnett, James, Kingsbury, New Hudson, Triumph, New Imperial, New Scale, Metro-Tyler, Omega, Paragon, Cotton, Velocette, Verus, Victoria, Vindec, Wooler, and Beardmore-Precision.

Again, some of the above may also be obtained with clutch and kick-starter, or with a two-stroke or four-stroke engine as desired.

More Powerful Models.

We will now take the machines offered to the enthusiastic clubman, who wants a fast solo machine on the lines of the pre-war solo "3½." There are quite a number of such machines now offered, thanks to the introduction of the 350 c.c. Blackburne four-stroke engine. Among the better known makes on which this engine is fitted, are the British Excelsior, a low and handy little mount, Hoskison, Verus, Coulson B, and Wilkin. Other four-stroke machines round about this size are the Royal Ruby, F.N., with shaft drive, and Bradbury.

For the business man, a two-speed gear is sometimes regarded as a necessity, while a clutch is almost as important. Any of the machines mentioned under these headings will be found suitable. On the other hand the artisan, who does not do so much traffic riding, will not be seriously inconvenienced by the absence of a variable gear or a clutch.

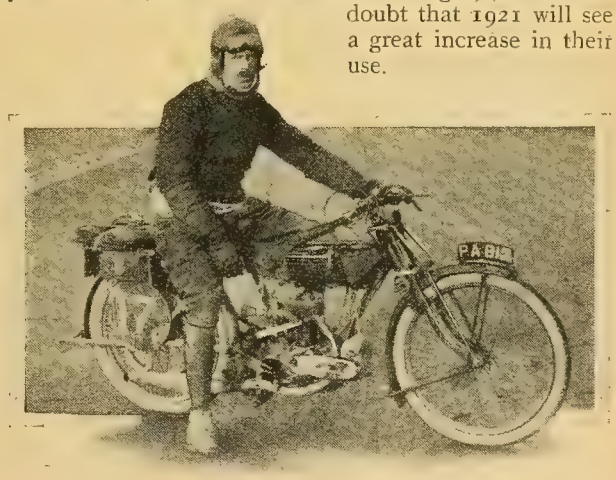
Those who require spring frame machines also are well catered for. In this class there is the new Hobart, the Wooler, Coulson, Beardmore-Precision, Royal Ruby, and P.V.

Motorised Bicycles.

There is one other type of machine which has not been mentioned in the foregoing. We refer to the ultra lightweight motor cycle on pedal cycle lines, but having a spring fork, a specially designed frame, and an engine of about 1½ h.p. Chief among such machines, which, incidentally, may be seen in greater numbers next year, is the J.E.S., a mount which is extremely economical, splendidly made, and a thoroughly good engineering job.

So far we have confined our remarks to solo machines, but there is no doubt that in the near future light sidecar outfits will become popular on account of their low initial cost, economy, and lower taxation than larger outfits. Several makers of lightweights are introducing complete outfits for 1921; and visitors to the Show, who are interested in this type of vehicle, should make a note to see the examples which will be exhibited by the makers of the Beardmore-Precision, Armis, Alecto, Connaught, Ixion, and Ivy.

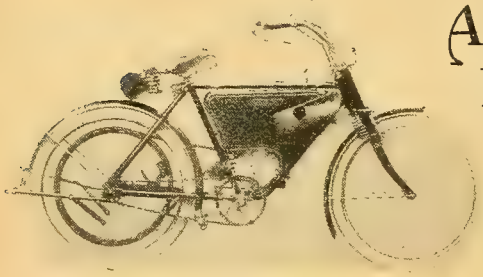
From the above it will be seen that there are lightweights for all; and, in view of the lower taxation next year for machines under 200 lb. in weight, there is no doubt that 1921 will see a great increase in their use.

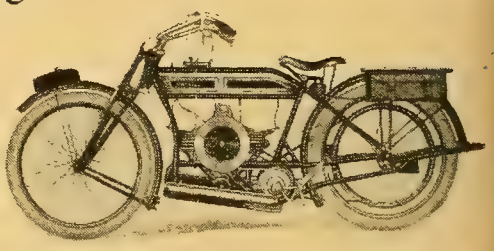


A type of mount favoured by those who enter seriously into competition with the larger machines—a 350 c.c. Blackburne, which made a splendid performance in the last Junior T.T.

The Lightweight

A Review of its Development



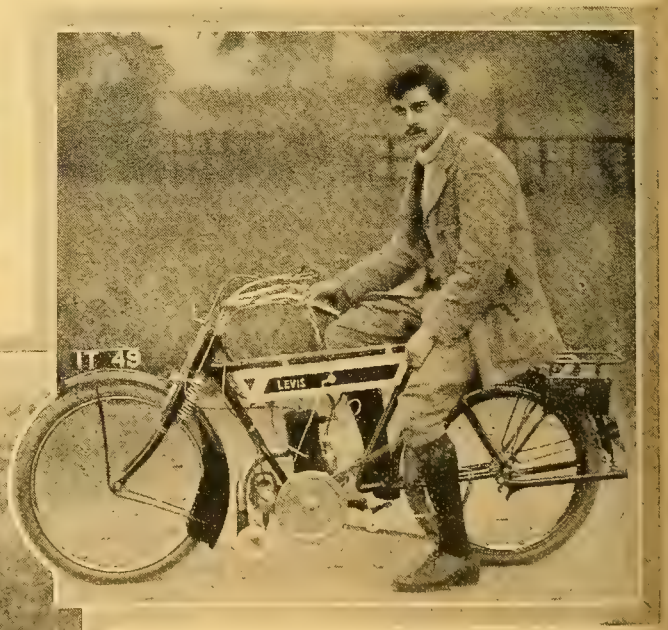


In tracing the History of the Motor Cycle Movement, it is apparent that the True Lightweight still requires Development.

AFTER the first motor cycles of the pioneer days had gone their way, the industry commenced to take notice of itself, to adopt a nomenclature, and to classify its products according to type.

Some years ago standards of measurements, as far as engine sizes are concerned, were vastly different from those obtaining to-day. For instance, a machine which exceeded a very nominal 2¾ h.p. was regarded with an awe something akin to fear by the average motor cyclist of the period, and the production of such machines invariably resulted in the press of the time being filled with comments on the over-development of motor cycles. The lightweight, as such, was then almost unknown, but at a little later date the industry decided that there was scope for two classes of machines; the first and most popular class comprised of those hurtling monsters of 350 c.c. or a little more, which served most purposes for fast travelling and passenger carrying (so long as the accumulators held out), while the second was something smaller, embodying a power unit developing 1¼ h.p., more or less, which it was thought would serve the needs of the modest solo rider who preferred to enjoy his riding in solitude. These machines, mark you, were all single-geared.

As time went on motor cycles generally became increasingly powerful, and capable of dealing with greater loads, but still the true lightweight as a type scarcely came into existence, although between 1907 and 1912 there were many machines which, as far as weight considerations alone are concerned, were in that category. These, however, were somewhat in the



(Left) In 1911-1913 a four-stroke 2¾ h.p. New Hudson machine had a considerable vogue, but it approached the mediumweight class, and could not be lifted up like this 1921 two-stroke which now bears its name, and even excels it in performance and reliability.

(Right) One of the pioneers of lightweight two-stroke construction, W. Hughes Butterfield, designer of the Levis, on a 1912 model. As will be seen, it possesses the general outlines of his latest production

The Lightweight—A Review of its Development.—

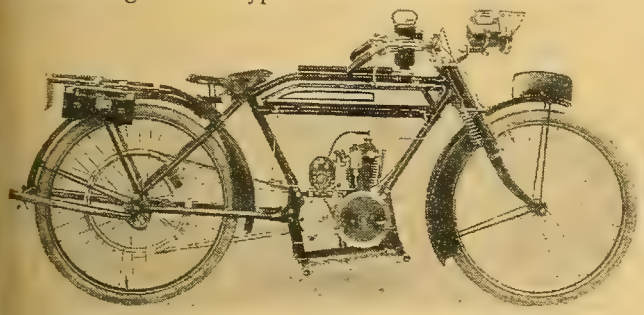
nature of glorified motor-assisted pedal cycles, and one or two of them, at any rate, enjoyed a considerable vogue. In this class, of course, the series of Motosacoche models, commencing with the 1 h.p. and finishing with the 2½ h.p. engine, stood pre-eminent.

The tendency to increase engine size, and, in consequence, to increase weight, is shown in the above example; and each increase of power gave an increase in range, which in turn gave birth to a desire for a still better performance, and so induced the designers to again enlarge the size of the engine, and so on.

Possibly this inclination to develop engine size was due to the lack of a really satisfactory change-speed gear, thus giving the designer no alternative other than an increase in cubic capacity if he wished to extend the performance range of his machine.

"Light Heavyweights."

The paradox of the heading to this paragraph is justified when we look back at the type of motor cycle which was most popular in the period from 1908 to the beginning of 1912. During those years the 3½ h.p. (500 c.c.) machine with single gear came into its own. The type was pre-eminent, and fully justified the gradual increase in engine size which led to its being. As a type which was almost the ideal



A design which did not survive, despite its apparently high promise. It is the Precision Junior of 1913, which had an integral two-speed gear and crank case, and may be said to be the forerunner of much modern lightweight design.

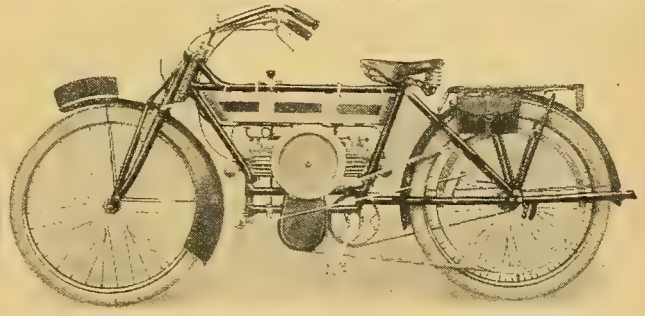
roadster machine it was capable of high speeds, it could climb almost any main road hill, it was economical to run, and, above all, it was light in weight, and consequently easy to handle. A machine with all these qualities can be turned out ready for the road with a total weight not exceeding 190 lb. Thus such a model used in 1921 would come under the lightweight ruling as far as taxation purposes are concerned.

The very success, however, of the fixed gear "3½" proved to be its own undoing from the standpoint of weight and simplicity. Equipped as it was, without any pretence at variable gearing, it could, nevertheless, haul a sidecar and passenger with quite considerable success over the majority of our British main roads, but, being put to this use, it followed that its frame had to be stiffened, and a clutch and gears introduced, in order to make it controllable in traffic and to give it climbing range in adverse circumstances. Thus the close of 1912 saw the end of the type which may truly be dubbed the "light heavyweight," since it was the custom to describe machines as lightweights or heavyweights according to the power of their engines.

About the same time as the fixed gear 500 c.c. machine developed into a luxuriously equipped passenger model, a certain section of the trade realised that there was some room for a hitherto undeveloped type. Instead of the heavy solo machine and the dual purpose (and passenger) outfits, it seemed that there was a potential demand for a machine of low power and light weight, which added to these qualities the capability of travelling anywhere where a motor cycle could reasonably be expected to go. Amongst others, the Douglas and Humber companies were successful in producing this type.

The years 1913 and 1914 saw many machines answering to this description, but, for the most part, their life was a short and merry one. The coming of the countershaft gear certainly increased the scope of machines fitted with miniature engines, but the latter did not seem to take kindly to the high revolutions which the use of an ultra-low gear called into use. Some of the most promising designs of that time did not prove as successful in the hands of the public as might have been expected.

Of late, however, the improved results which have been obtained from small two-stroke engines have entirely revolutionised the state of affairs as regards the utilisation of small capacity engines. Thanks to its



The forerunners of the Douglas were exceedingly small, but in the effort to compete with bigger machines, the 2¾ h.p. model developed into a comparatively heavy three-speed touring mount. The illustration is of the 1911 model, to which a two-speed countershaft was first fitted, while pedalling gear was retained.

increased efficiency, and the knowledge which has been gained in several years of searching test, the small two-stroke is now capable of running continuously at high revolutions without being subject to the overheating troubles which were experienced with the earlier samples, and consequently this type of engine is extremely well fitted to be used in conjunction with a wide range of gears, thus taking advantage of the low weight of a small power unit.

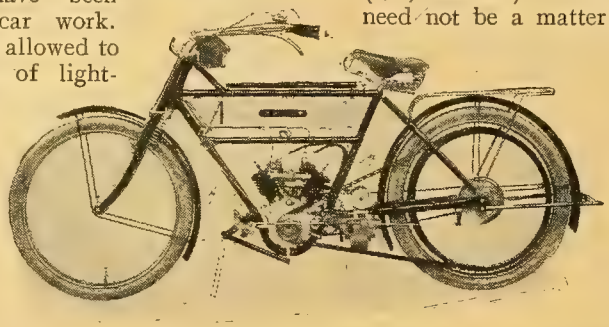
A Plea Against Over-development.

At the present time it is possible to produce a lightweight machine equipped with chain-drive, mechanical lubrication, and, indeed, a thoroughly modern specification, at the same time keeping its weight within reasonable limits. Unfortunately, however, the machines of this class are capable of doing much more than the ordinary rider wants of them in everyday running, and in consequence there is a temptation to make the most of this surplus power by introducing light sidecar attachments.

If the limitations of an outfit of this class are strictly regarded, no great harm is done by the above-men-

The Lightweight—A Review of its Development.—

tioned tendency, but if manufacturers produce such machines, the public will no doubt expect the same performance from them as from larger and more powerful outfits, which have been designed specially for sidecar work. Should this state of affairs be allowed to develop, those same makers of lightweight machines will find themselves, willy nilly, increasing weight in order to guard their products against the breakages which almost inevitably follow the addition of a sidecar to a light frame; and thus, having increased the weight of the frames by so doing, they will need to increase the size of the engine in order to tow the additions, and so the vicious circle recommences.



When the Enfield Cycle Co. produced this 2¼ h.p. machine in 1910 it was exceedingly light, but as time went on it developed into a 3 h.p. medium weight, and was finally abandoned, leaving a miniature two-speed two-stroke as the sole lightweight representative of its name.

The True Market.

The lightweight machine as such should be capable of travelling over any reasonable road or hill in the British Isles, it should be reliable and economical in upkeep, and offer the rider himself a reasonable degree of comfort. At the same time, in view of the fact that machines from 1921 onwards will be taxed according to weight, the machine intended purely for solo work should be brought within the lower weight limit (*i.e.*, 200 lb.). The actual power of the machine need not be a matter of great importance, since a machine of 8 h.p., if it conforms to the legal weight limit, would still be in the lightweight class. In order to keep down weight, however, the machine should be developed solely as a single-purpose machine, and any attempt to equip it for passenger work should be rigidly avoided.

Within reason, the lighter the machine the better, so long as the weight is not cut down to the extent of sacrificing safety or comfort. A machine produced with these requirements in view would appeal to a very large market at present unsatisfied by the heavy double purpose mounts which have been largely developed with an eye on their performances as sidecar machines.

WHARFEDALE.

FRENCH LIGHTWEIGHT DESIGN.

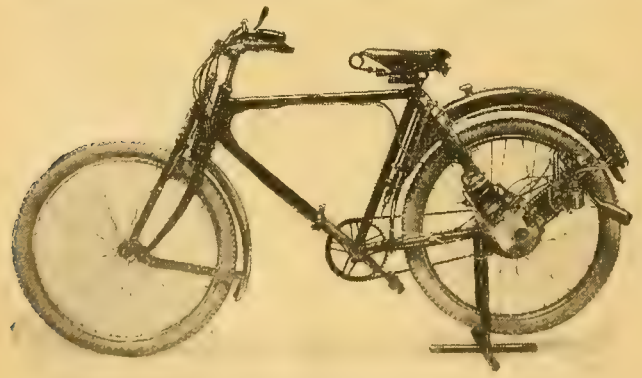
Two Examples of "Clean" Design from Across the Channel.

IN matters relating to motor cycles the French are the exact antithesis of the Germans. The former are nearly always original, but the Teuton has less initiative, and generally prefers to copy. British and American designers may be said to represent a happy medium.

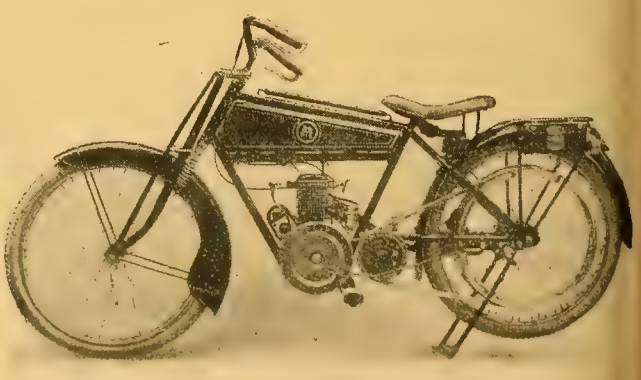
The revival of the French motor cycle industry revealed more ingenuity and advanced design than have been produced by any other country producing motor cycles, the chief aim being neatness and cleanliness of design generally. As a result unit construction of engine and gear box is fairly general practice, both in sidecar and solo machines.

We give below two examples of French lightweight design, which are of special interest in an issue devoted mainly to light solo motor cycles. The Lumen, with its invisible drive, represents a type of which there are too few machines to suit the pedal cyclist about to take up the petrol-driven vehicle. It may not seem important to the actual motor cyclist that there are no chains or belts in its transmission; the Lumen transmission and the position of the engine may not be so conventional as usual British practice, but there is certainly less mechanism *visible*, and its apparent simplicity is a point in its favour when the market for which it is designed is taken into consideration.

As an example of clean design, the little Moto Solo is of interest, while there are several other French machines which embody combined engine and gear box units.



A neat lightweight having a Lumen engine on the side of the rear wheel and a curved petrol tank which serves as a mudguard



The Moto Solo—a French lightweight on British lines, but smaller and lighter.

THE OUTLOOK FOR LIGHTWEIGHTS.

Among the Many Factors which will further Popularise the Light Machine in the Future are Low Cost, Low Upkeep, and Low Taxation.

By B. H. DAVIES.

IF you ask the average small dealer how lightweights are selling just now, his reply will be either lugubrious or blasphemous according to his temperament. He will admit that he has sold a good many during the past year, and that the vast majority of his clients are quite satisfied with their bargains. But he will probably complain that he still has a few in stock which he cannot dispose of, and he will state his intention of being very cautious in sizing his lightweight contracts for 1921.

In casual conversation the average small dealer probably delivers his soul in this strain, and the spectacle of several unsold 1920 lightweights, remaining unsold in his window or showroom week after week, creates a somewhat similar impression. But in actual fact such superficial impressions are entirely misleading, as I will proceed to demonstrate.

An Assured Demand.

In the first place, the lightweight is necessarily the cheapest type of motor cycle, and because nobody is less cautious or more irrepressible than the budding motor cyclist, lightweights will inevitably sell very freely in these days of high prices. They will sell irrespective of whether the average commercial pattern is good, bad, or indifferent, of whether it can or cannot do what the typical rider desires. The higher its quality, and the wider the range of its performance, the bigger the sales. But they *must* be big, in any case, because each year brings thousands of new motor cyclists up to the purchasing point, and many of them can afford £70, though they cannot produce £150. Under the current *régime* of high wages, the young bachelor artisans will be good buyers of lightweights.

The Tax Incentive.

In the second place, another six weeks will see the industry overshadowed by the 1921 taxation scheme, under which machines scaling less than 200 lb. contribute less to the revenue than machines which exceed that figure. It is plausible, but idle, to pretend that this somewhat arbitrary classification will have no marked effect on design or on the market. The R.A.C. rating of car h.p. has unquestionably sired the small bore, long stroke, car engines of to-day. For years past, eight car buyers out of ten have been sensibly influenced by the taxable ratings of the cars between which their fancy oscillated.

At the 1920 and succeeding Shows we shall see manufacturers guaranteeing the actual weights of their machines, salesmen making a great talking point of light weight, and customers growing increasingly inquisitive on the subject.

It will take a year or two to bring the new factor into high relief, but never again will the trade or public regard the weight of a machine with their old

The real lightweight of the future should be as light as this little Baby Levis, which could be carried about quite easily

indifference. In particular, from January 1st, 1921, machines which exceed the 200 lb. limit *by a few pounds* (say 50 lb. or less), and *without any very obvious justification for doing so*, will steadily tend to become unsaleable. The machine which weighs distinctly less than 200 lb., all on and ready for the road, will become stereotyped, and the alternative class will weigh a great deal over 200 lb., or will offer very substantial compensations in specification for the extra tax with which its owner is burdened.

Seeing it is a long while since an A.C.U. Six Days Trial secured any appreciable entries scaling less than 200 lb., there will be a regular scurry to reduce weights this winter.

Lightweights in the 1920 Six Days.

Yet a third factor of the first importance is to be noted in the great efficiency shown by some of our best lightweights in the 1920 Six Days Trials. The opinion of the men who were there is that no special reason exists to prevent a dozen makes of lightweight doing as well in 1921 as the Velocette did in 1920: and that all of them did very much better than any printed account of a remarkably strenuous week can ever convey. The triple considerations of price, tax, and quality thus guarantee an abnormal and increasing demand for lightweights.

The facts cited up to this stage of the argument are demonstrable. The precise future of the lightweight unfortunately hinges upon considerations about which it is too early to dogmatise. The first and most important doubt is whether or not a certain section of the trade will continue to make appallingly bad

The Outlook for Lightweights.—

lightweights, and to dump them on an innocent section of the public. The engine is the only really expensive component of a motor cycle, and a small two-stroke engine is quite cheap to build, though by no means easy to design. If a bad engine is assembled with fittings of the cheapest class into a crude and shoddy layout, a peculiarly objectionable lightweight results. Such machines have been sold by the hundred, perhaps by the thousand; and every one of them has done the movement untold harm. Parsons, lawyers, chemists, doctors, and bricklayers prevent unqualified persons from entering these honourable professions, but there is nothing to prevent a half-baked amateur mechanic with a litle cash or credit from starting in business as a motor cycle engineer in a small way. The lightweight machine is generally the happy hunting ground of such gentry; the expense and discomfort of machines begotten in this way utterly baffle description. It would be a public benefit if the trade society could strangle such enterprises at birth; if they are allowed to survive till their cash or credit are exhausted, they will help to perpetuate an unfortunate prejudice. Few journalists are familiar with the sort of machine I mean; I know them through friends who made foolish purchases, and can testify that the best engine, if assembled in an unduly whippy frame with cheap fittings, can form a regular nightmare of a mount.

Good Factory Methods Essential.

The plain fact is that narrow limits of weight and cost intensify all the technical problems of design. A good designer and a good factory are absolutely essential. The small dealers should relentlessly refuse to handle dud stuff in these lines. Still less should they prefer the increased profit of assembling an "own transfer" machine to the small commission payable on the sale of a first-class proprietary mount. I go so far as to hope that before long the lightweight will cease to figure as the "side line" of a big factory devoting its main energies to another type of machine. No man can serve two masters. If the Rolls-Royce Co. bought up the G.N., they would spoil it, unless they maintained two entirely separate staffs and organisations. I am not blind to the debt which the lightweight owes to the Baby Triumph and Clyno—both "side lines." They are the exceptions which prove the rule. The full development of the lightweight can never come until more first-class concerns run lightweights as their main line.

What Will They Do?

Finally, it must be admitted that the modern lightweight has already come within measurable distance of offering the kind of performance which the more sedate types of solo rider demand. They can climb absolutely any hill. They are fast enough—if apt to be fussy at speed, and over-liable to both engine and road vibration. Their reliability factor may hardly be as high as that of a first-class 500 c.c., but it is a great deal higher than it was, and quite high enough for ordinary service. Their economy is distinctly good; oil, petrol, and tyre bills are all proportionately low. Comfort ought certainly to be isolated as the item in which their shortcomings are concentrated. I do not think the solution lies in the direction of extra springing. Hitherto the majority of lightweights have been foolishly disfigured with small tyres and tiny saddles. It is obvious that they want big tyres and big saddles, because rough roads deflect them so violently. So long as their tyres were small, weight had to be piled on to their mechanical parts; if heavy tyres were boldly adopted, it might be possible to lighten the mechanical structure appreciably without detriment to strength.

In the meantime, it is the business of every agent to refuse to handle any shoddy stuff. It is the duty of makers to expect large business beneath the 200 lb. line, and to be ready with good propositions.

Lightweights on the road. Both speedman and tourist will find their needs easily met in the many various types on the market to-day.

A Guide to Olympia.

Next Thursday's issue of *The Motor Cycle* will be a comprehensive forecast of the exhibits at Olympia, which opens its doors to the motor cycle world on November 29th.

Motor Cycling in Ireland.

A press photographer who often officiates for *The Motor Cycle* is at present in Ireland, and from his accounts of experiences during the present crisis, there are more pleasant places for motor cyclists than the Emerald Isle. As the railway service is slowly being strangled, the motor vehicle is the only convenient means of getting about; and a few days ago, in company with several other pressmen, our correspondent states he was held up at the point of a revolver, first by the R.I.C. and then by Republican Volunteers.

Coachwork on Cars.

To-morrow's issue of *The Autocar* is the fifth and last of the 1920 Show numbers. Special features include a fully illustrated and detailed report of the coachwork exhibited at Olympia and the White City, thus concluding the most complete review of automobile progress which has ever been provided.

THE MOTOR CYCLE

GUIDE to OLYMPIA.

Intending visitors to the Motor Cycle Show at Olympia (Nov. 29th—Dec. 4th) will appreciate the special contents of next Thursday's issue. It will form a convenient Guide to the Exhibits. Illustrations will be a feature.

ON SALE THURSDAY, Nov. 25th
—— 4½d.——

FREAK HILL-CLIMBING IN CALIFORNIA.

An American X on Capistrano Hill. Observe the large rear sprocket and the tractor bands on the rear tyre. Both British and Americans delight in hill-climbing, but how different their conception of this particular sport.

Special Features.

LIGHTWEIGHTS FOR ALL.
WHICH TYPE OF MINIATURE?
LIGHTER LIGHTWEIGHTS.

Weights.

It behoves every manufacturer of a lightweight to be prepared at Olympia to give proof of the weight of his machines. Why not a weighbridge certificate displayed in a prominent position?

Motor Cycle Fox Hunt.

Motor cyclists are being invited to a fox hunt being arranged at Salt Box Hill, Cudham, and the event promises to be a novelty. Some years ago a Bradbury rider took part in a fox hunt in the same district, and was present at the death. The coverts are in the chalk hills of Cudham, and depredations by the foxes are becoming serious.

Stolen Motor Cycles.

Every week we receive detailed particulars of stolen machines from readers who hope that their appearance in *The Motor Cycle* may lead to their recovery. Probably some of the culprits are readers of *The Motor Cycle*, therefore by publishing particulars of those small matters by which a machine may be identified, we should draw attention to them, and so cause their removal. It is far better that these details, such as a cracked grip, or an odd size nut, are known only to the police; but we fear that the majority of robberies are the work of an organised gang, who dismantle and rebuild before attempting to dispose of them.

Imports and Exports for October.

A slight increase over last month is evident in the Board of Trade returns of foreign motor cycles and parts imported during October. The actual figures with comparative amounts for two previous years are:

IMPORTS.

	October, 1913.	October, 1919.	October, 1920.
No. of motor cycles ..	116	142	212
Value of machines and parts	£8,962	£9,397	£26,406

There is a slight fall in the number of British motor cycles exported compared with September, but on the whole the figures remain at a high level.

BRITISH EXPORTS.

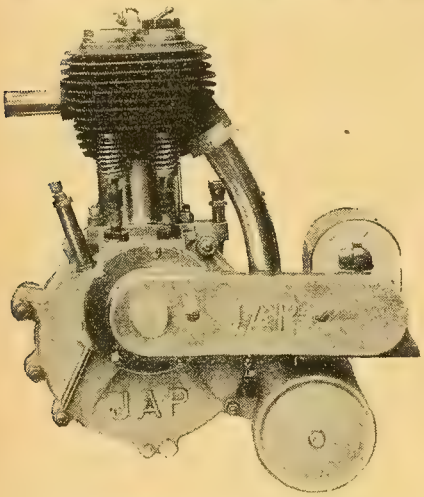
	October. 1913.	October, 1919.	October, 1920.
No. of motor cycles ..	1,431	661	2,333
Value of motor cycles only	£63,861	£46,416	£191,857
Value of parts and accessories	£23,246	£39,618	£67,953
Total value ..	£87,107	£86,034	£259,810

J.A.P. Engine Modifications.

Improved Cooling, Timing Gear, and Finish.

CONSIDERABLE improvements have been made in the construction and design of the latest pattern J.A.P. engines, and on the occasion of our last visit to Messrs. J. A. Prestwich and Co.'s now extensive factory we were struck by the excellence of finish and workmanship. The die-cast aluminium crank case and the polished timing gear and chain case look particularly attractive, and give the engine an extremely handsome appearance. Other external improvements are also evident. It can be seen from the illustrations that the cylinder fins are numerous and thin, while their shape has been slightly modified. The apex oil union has been discarded, and an oil lead to the front cylinder is now permanently built in. These features are common to all of the twin-cylinder models. The chief difference, however, in the 5 h.p. twin-cylinder is the simplification of the timing gear, which now follows the design of the 8 h.p., there being only two timing wheels, a small pinion and the larger one carrying two cams operating all four valves. The position of the compression taps has also been altered, and instead of being in the centre of the cylinder, these are now at the side opposite to the valve cap. A straight induction pipe now joins the two unions, whereas formerly this was arranged in the shape of an inverted V.

Racing models are fitted with long "fir cone" pattern aluminium exhaust valve caps, which, we are assured, dissipate the heat very rapidly.



The newly-designed 2¾ h.p. J.A.P. engine

Engines for All.

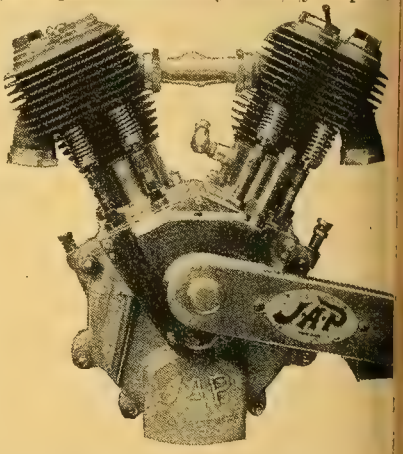
The 8 h.p. water-cooled engine for cycle cars has also undergone considerable improvement, and is now provided with larger water jackets. It follows the lines of the air-cooled pattern in most other respects.

New pistons are fitted to all types, and these are provided with two thin rings at the top, and one scraper ring at the bottom, while the gudgeon pins are a driving fit, and have brass caps at their extremities.

The popular little 2¾ h.p. has also been slightly altered in design. The cylinder has many more radiating fins, and those on the top of the cylinder run longitudinally, thereby greatly aiding the cooling. One of these we saw fitted with three overhead valves (two exhaust and one inlet), and a similar side-by-side valve engine with an aluminium piston, roller big end and ball bearing crankshaft, with which Mr. Vivian Prestwich intends to attack the lightweight records.

There is also a six-valve twin-cylinder racing engine of 500 c.c.

Extreme care has been exercised in the manufacture of these engines and their wonderful finish is noteworthy. There seems little doubt that the popularity of the J.A.P. during 1921 will be enormously extended, all the brains in the factory being concentrated on obtaining the highest possible efficiency in every respect.



Years of experience are behind the production of J.A.P. engines. Here is shown the new 5 h.p. model.

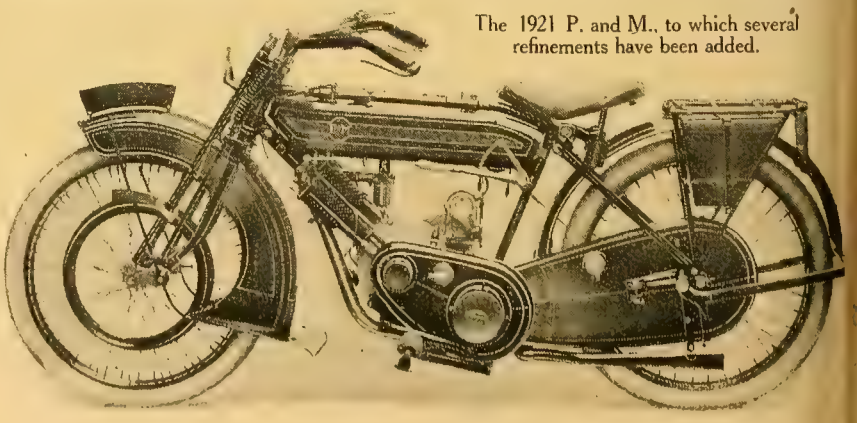
The P. and M.'s in 1921.

New Spring Drive and Modified Oil Pump among the Detail Improvements.

THE 1921 P. and M. is an interesting machine, which shows the result of five years' intensive motor cycle manufacture during the war, and has proved so entirely satisfactory that it is to remain the company's sole model.

Although the engine is not designed for excessively high speeds, it has been considerably improved as regards power output in comparison with its predecessor. Thanks to the horizontally-arranged radiating fins and the design of the combustion chamber and valve ports, the 500 c.c. engine will easily pull a sidecar without the slightest tendency to overheat. Since also the frame and forks are of abnormal strength, the machine itself is well up to sidecar work, while the lugs incorporated in the construction enable the sidecar to be attached at four points on either side of the machine. In a word, the P. and M. is an efficient double-purpose mount.

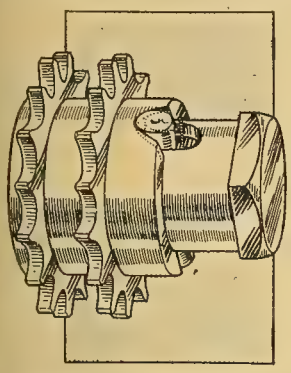
A mechanical oil pump, the efficacy of which was proved in a recent officially-observed A.C.U. trial, has been slightly modified in design. The oil pipe leading from the tank is now situated at the top, and a new cap is provided at the end, which has two internal seatings or faces preventing any possibility of leakage. Owing to the great leverage obtained on the kick-starter, and the fact that it acts directly on the engine-shaft, very little effort is required to get the engine to fire; and, as an example of the refinements to be found on the machine, it may be mentioned that rubber buffers are provided, against one of which the starter pedal rests when out of use, while it comes up against the other one at the furthest end of its travel. The chain drive and substantial and easily detachable chain covers remain unaltered, but an improvement in the transmission has been incorporated



The 1921 P. and M., to which several refinements have been added.

P. and M.'s in 1921.—

in the shape of a new transmission shock absorber. This consists of a sleeve rigidly attached to the engine-shaft carrying both engine chain sprockets; a peg held by



P. and M. shock absorber.

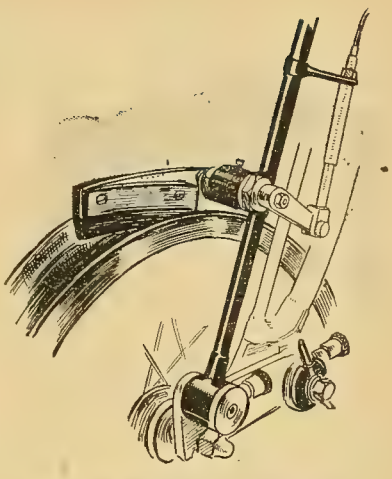
means of a spring projects through slots in the fixed sleeve, and engages with two V-shaped notches in the loose-fitting sprockets. Oil holes are provided at the back of the device for purposes of lubrication.

Some improvement has also been effected in the design of the brakes. Not only is the excellent rear wheel contracting band brake, actuated either by a hand-operated ratchet lever or a brake pedal, retained, but a new front brake has been designed, consisting of a long shoe fitted with two compressed Ferodo blocks engaging with a dummy belt rim. The system of braking is especially suitable for sidecar work, as, in addition to two powerful and efficient brakes, the ratchet lever allows the machine to be left standing on a gradient with absolute safety.

Good Mudguards.

Throughout the whole machine great attention has been paid to detail. Mudguarding has been specially studied. The design of the clips fastening on the rear mudguard is particularly sound, while the front guard is completely valanced, and is provided with a large splashguard. The finish is as good as ever, and the machine still remains one of the best equipped, best turned out, and most reliable mounts on the market.

The following details may be of interest: Weight, 265 lb.; ground clearance, 5½in.; petrol capacity, 1¾ gallon; oil capacity, 3½ pints. The tyre equipment is 2½in. anti-skid Kempshalls. The makers claim that the petrol consumption with sidecar and passenger is 70 miles to the gallon, and 1,200 miles to the gallon of oil, and these figures were more than substantiated in the recent A.C.U. tests.



The improved form of front brake.

For Speedmen and Fast Tourists.

A 3½ h.p. Six-valved Sporting Twin and a Light 5-6 h.p. Model added to N.U.T. Range.

DURING the present year the 3½ h.p. N.U.T., which has made itself well known by the number of successful erformances in competition, has shown o sign of requiring alteration in any irection, and consequently the makers ave decided to continue with the same pecification next year.

Primarily, the N.U.T. design was inended to represent the best that could e made as a purely solo machine, but has been found that a number of users esired to attach light sidecars. When his has been done, the charm of the achine has been somewhat decreased, it is well known that the small V vin engine owes its popularity to ich qualities as smooth running, quick celeration, and the ability to maintain high average speed with little apparent fort. These qualities, however, are most at once sacrificed if an engine this type is unduly overloaded, since does not possess the "slogging" power a single-cylinder engine of the same bic capacity.

A Fast Solo Machine.

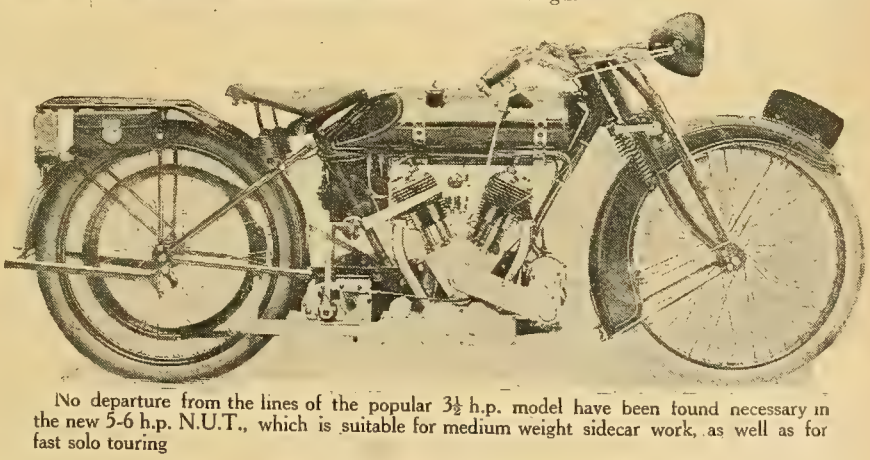
The makers of the N.U.T. have, therere, decided to include a second model their programme which will be more itable for sidecar work. This will take e form of a 5 h.p. machine having actly the same specification as that of e 3½ h.p., with the exception of an crease in cylinder dimensions. It must understood, however, that the new odel remains essentially a solo machine, ce the weight is kept low, and final lt transmission is employed. It is not ended that the machine shall compete th the high-powered and luxuriously-rloaded sidecar outfits of the 8 h.p. ss, but a special form of light sidecar will be recommended for use in connection with it.

The general specification of the 3½ h.p. and 5 h.p. models is identical; and, indeed, with the exception of the engines, the two machines are composed of interchangeable parts. The Lucas Magdyno electric lighting and ignition outfit is a standard fitting on these machines.

A High Efficiency Model.

In addition to the two machines mentioned, a new line, which will appeal especially to the sporting fraternity, is the 3½ h.p. overhead valve model. The dimensions of the V twin engine are the same as the standard 3½ h.p. (64.5×76 mm.), but the engine is of a special racing type, having one inlet and two exhaust valves per cylinder, these being carried in detachable heads. The specification of the machine remains much the same as that of the 3½ h.p. model, since the frame and transmission are similar. There are some departures in detail, however; for instance, the Magdyno gives place to a simple magneto, while, instead of the complete chain case on the primary drive, a light cover is fitted over the top run of the chain. The spring forks, mudguards, and handle-bars are of the racing type. In other respects the finish and appearance conform to the general high standard which characterises all the N.U.T. products.

The N.U.T. made its first public appearance at the Olympia Motor Cycle Show of 1919, and there attracted a considerable amount of attention amongst the sporting fraternity, as it was designed as the "last word" in solo mounts. It is interesting to note that the manufacturers have found no reason to modify their design.



No departure from the lines of the popular 3½ h.p. model have been found necessary in the new 5-6 h.p. N.U.T., which is suitable for medium weight sidecar work, as well as for fast solo touring

100 Miles Within 100 Minutes with a Sidecar.

More Indian Records. Mean Speed Figures Established.

FOLLOWING on the successes created by H. Le Vack, reported in the last issue of *The Motor Cycle*, the same rider broke a wonderful series of records with the same machine, but with sidecar attached. The machine he used was a standard Indian Powerplus racing model, bore and stroke 79 mm. × 100 mm., 997 c.c., fitted with side by side valves, while he used Shell aviation spirit and Wakefield Castrol.

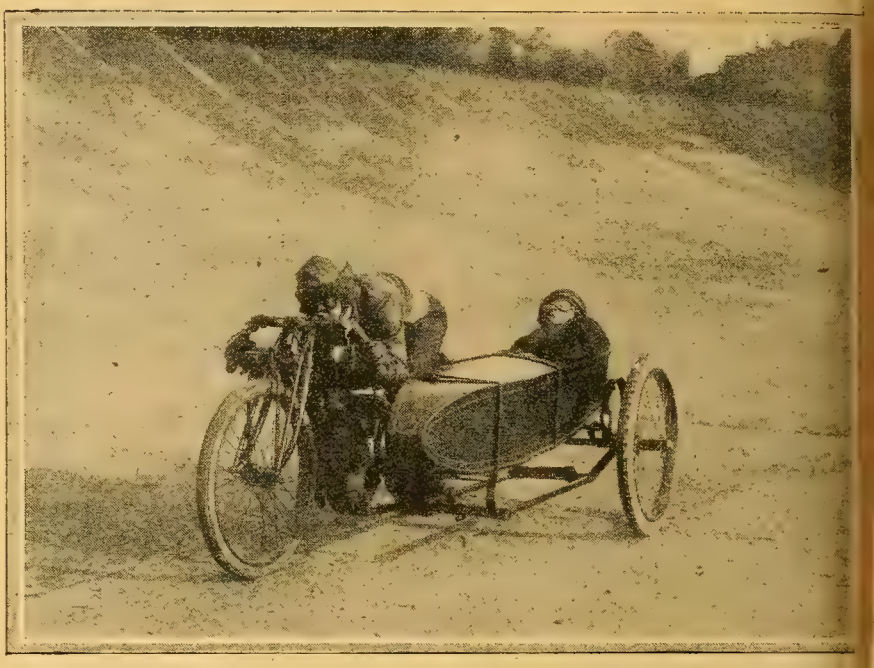
Le Vack opened the ball by an attempt on the two short distance records, and succeeded on each occasion. The flying kilometre was covered in 29s. at a speed of 77.14 m.p.h., the flying mile in 48.4s. at a speed of 74.38 m.p.h. If confirmed, these will be world's records. The average mean speed record flying kilometre worked out at 29.9s., a speed of 74.82 m.p.h.; and the flying mile at 50.7s., 71.01 m.p.h. These, of course, would be international records.

Over 60 m.p.h. for a Hundred Miles.

Le Vack next attempted and succeeded in breaking the five-mile flying start record, covering the distance in 4m. 16.1s., 70.28 m.p.h. He then tackled the ten miles standing start, time 8m. 51.08s., 67.78 m.p.h. After this he settled down to make havoc of the long-distance records, and started by capturing the fifty miles, which he covered in 43m. 55⅖s. (68.03 m.p.h.). In the hour he covered 65 miles 394 yards, his average working out at 65.22 m.p.h., and he finished up with the 100 miles record, which was covered in 1h. 39m. 40⅕s., average 60.19 m.p.h.

This is the first sidecar machine to accomplish 100 miles in under 100 minutes. The weather conditions were fairly good, but a strong south-westerly wind was blowing all the time.

Just before the hour record was completed, tyre and chain trouble was experienced, which naturally lowered the speeds. Altogether three chain breakages occurred, the last occasion occupying over six minutes, as it occurred some distance from the timing box. The machine was travelling just as fast during the last part of the record run as at the outset.



The first sidecarist to cover one hundred miles in less than a hundred minutes. H. Le Vack on his record-breaking Indian.

This performance is one of which the Hendee Manufacturing Co. may be justly proud. It reflects great credit on the prowess of the rider, the excellent tune of the machine, and its ability to stand up under such strenuous conditions.

The previous best performances were: Class 1, for motor bicycles with sidecar of which the cylinder capacity does not exceed 1,000.—Flying km., May 17th, 1912, G. F. Hunter (Zenith-Jap), 30.76s., 72.72 m.p.h.; flying mile, May 17th, 1913, F. W. Barnes (Zenith-Jap), 51.35s., 70.1 m.p.h.; flying five miles, D. R. O'Donovan (Norton), September 22nd, 1915, 5m 6.2s., 58.78 m.p.h.; ten miles, July 17th 1920; E. C. Baragwanath (Zenith-Jap 9m. 48s., 61.22 m.p.h.; fifty mile October 18th, 1913, E. B. Ware (Zenith Jap), 53m. 25.4s., 56.50 m.p.h.; 100 miles July 12th, 1920, J. D. Marvin and J. O'Sullivan (Harley-Davidson), 1h. 53m 1.4s., 53.09 m.p.h.; one hour, October 18th, 1913 E. B. Ware (Zenith-Jap), miles 542 yards, 56.30 m.p.h.

Thus many long-standing records have been beaten as well as some of recent date

CLUB NEWS.

A Motor Cycle Club in Eltham.

It has been suggested that a motor cycling club be formed in Eltham with a view to arranging sporting and other events for the forthcoming year. The proportionately large number of motor cyclists in this district would seem to warrant the step, and should ensure its success. Perhaps interested persons will communicate with Mr. C. N. Macarthy, 22, Crookston Road, Eltham, S.E.9, when a meeting will, if at all possible, be arranged, and the matter discussed if sufficient support be forthcoming.

Leeds and District M.C.C.

Fourteen entrants competed on a seventy-five mile course of moderate severity in the reliability trial held on November 7th. In spite of the very greasy surface on Greenhow Hill, the titbit of the trial, all starters finished, including Miss Spink, who rode a lightweight Triumph. Results: 1 (gold medal), W. Backhouse (4 Triumph), lost 5 marks; 2 (silver medal), S. Jepson (6 A.J.S. sc.), lost 7 marks; 3 (bronze medals), M. Hardy (8 Enfield sc.), lost 11 marks, which was the number also lost by P. Ward (8 Matchless sc.).

North Wales M.C.C.

The old crock hill-climb, organised by the above club, was held on Moel Parc Hill, Avonwen, on Thursday, November 4th. The machine used was an old New Imperial, kindly lent for the occasion by the president, Mr. W. Edwards, Denbigh. The machine proved not so much of an "old crock" as was expected, for, to the astonishment of all, after many failures, three competitors actually took the machine over the top, which was at first considered beyond the capacity of the machine. To find the winner, each competitor was given one attempt on top gear, with the result that the club gold medal is awarded to A. J. Thomas, Preswylfa, Denbigh.

Cambridge University M.C.C.

A very successful hill-climb was held by the C.U.M.C.C. at Croydon Hill on Saturday, November 6th. A fast and slow flexibility test on the hill gave the following results on formula: 1, H. Howson (3½ Norton); 2, G. Rea-Arm (7-9 Harley-Davidson); 3, G. A. Jenk (7-9 Harley-Davidson). Also a fast hill climb with varying classes: Unlimited solo.—1, E. G. Saunders (7-9 Indian); 2, A. S. Brereton (7-9 Harley-Davidson). Under 600 c.c.—1, E. Reed (3½ Sunbeam); 2, J. R. Thomson (3½ Norton). Under 350 c.c.—1, S. J. Basse (Douglas); 2, J. L. Giles (2¾ Omega). Sidecars.—1, R. North (3 A.B.C. sc.); B. A. Hall (4 Triumph sc.).

Club News.—

The Western Centre A.C.U.

In our report of the recent team trial amongst clubs with the A.C.U. Western Centre (when, as reported in our last issue, no one succeeded in making a non-stop performance) the results announced transposed the mileages achieved by A. King-Smith and P. Grout, which were 2.9 and 15.8 miles respectively. This did not affect the total of the Bristol M.C.C., however. The reserve rider who made up the Stourbridge team was J. M. Dosher.

Yorkshire Centre A.C.U.

A second meeting in connection with the above centre was held at the Great Northern Hotel, Leeds, on November 8th. Mr. J. Norman Longfield presided, and Mr. A. Walton (Leeds and District Motor Cycle Club) was elected treasurer *pro tem.* of the centre. Three new clubs were elected to membership, now bringing the total to eleven, as follows: Bradford, Ilkley, Leeds and District, Leeds Motor Union, Sheffield and Hallamshire, York, Doncaster, Dewsbury, Wakefield, Wombwell, and Keighley.

Mr. Longfield was unanimously elected delegate to represent the centre at the meetings of the A.C.U. at Olympia, and two resolutions were passed which will be of interest to other centres.

(1.) That the A.C.U. be asked to allot at least three open events for 1921 to the Yorkshire Centre. (2.) The A.C.U. be asked to allot all open events to centres only, and not to individual clubs, and that centres shall decide to which of their clubs in membership these events shall be given.

Mr. W. A. Dovener (secretary of the Bradford Motor Cycle Club) is hon. sec. *pro tem.* of the centre, to whom all correspondence should be addressed at 26, Beamsley Road, Frizinghall, Bradford.

West Kent M.C.

The West Kent Motor Club has absorbed the recently formed Bromley Motor Cycle Club, and, as a result, one is justified in anticipating a promising future for the club. The secretary will be pleased to meet intending members at either of the runs on November 28th, at 11 a.m., starting from the Bull Hotel, Chislehurst (a flexibility test), or on Saturday, December 11th, at 2.30 p.m.

West Birmingham M.C.C.

The prizes in the trial held on September 20th will go to the following. Best performance, S. Brand (3½ Indian), 29% marks; 1, over 500 c.c., H. J. Edwards (4¼ B.S.A.), 28%; 2, over 500 c.c., W. H. Scott (6 Zenith), 21%; 1, under 500 c.c., E. C. Iles (3½ Sunbeam), 7%; 2, under 500 c.c. E. Leek (3½ Rover), 3%; sidecar prize, J. Hamilton Ross (3½ Sunbeam sc.).

Barrow and District M.C.

A new club has been formed in Barrow-in-Furness by certain members of the local branch of the N.M.C.F.U. Application has been made for affiliation to the A.C.U. The secretary is W. A. Singleton, 144, Sutherland Street, Barrow.

Southport A.C.

This club's trial for the Blake challenge cup was run off on Saturday last over grass-grown tracks and included a sporting hill climb in the quarry district of Parbold. Out of sixteen starters only five finished, the winner of the cup being E. C. Eckroyd (Triumph). T. Picton (Sunbeam) took the White cup.

A Sports Model Royal Ruby Lightweight.

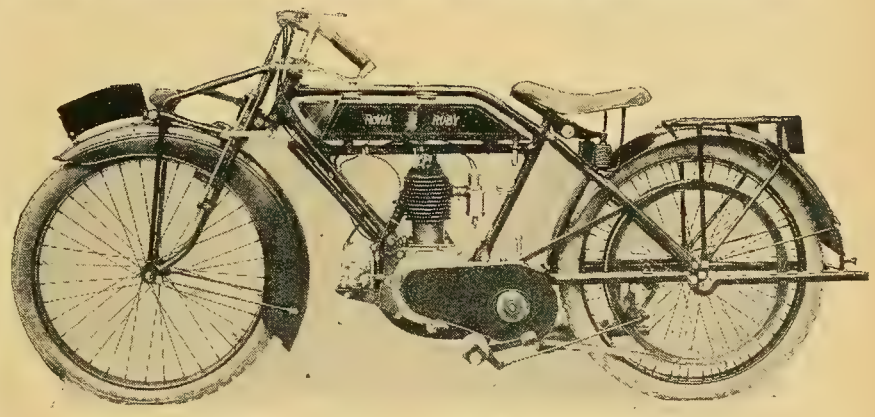
Weight Reduced and Rigid Frame Adopted to Provide a Light and Simple Machine.

HITHERTO the Royal Ruby machines have been fitted with a completely sprung frame, but a new model lightweight with a rigid frame will be placed upon the market during 1921.

This machine largely conforms to the specification of the spring frame model which was exhibited at Olympia last year, but it has been designed specially to appeal to the sporting rider who is prepared to sacrifice a certain amount of comfort for a decrease in weight with the corresponding possibility of obtaining greater speed.

The main frame follows conventional lines, but it embodies the Royal Ruby patent safety stays, which eliminate all chance of a fracture of the front down tube. The spring forks also are of similar design to those used on the spring frame model, and embody the same laminated and adjustable system of springing.

Engine and gear box are the same as those used in the spring frame models, the engine being a 3 h.p. single-cylinder four-stroke, and the gear a two-speed countershaft box with clutch and kick-starter. Both these components are manufactured throughout in the extensive works of the makers at Altrincham, Manchester.



A new sports model 3 h.p. Royal Ruby. It differs from the standard production in the elimination of the spring frame and the substitution of footrests for footboards.

In place of the footboards of the standard model, footrests are fitted and semi-T.T. or up-turned handle-bars may be had as desired. The equipment and finish are excellent, and in every way come up to the high standard which has been set in all the products of the makers.

CURRENT CHAT (Continued from p. 595.)

Subscriptions Go Up.

Both the A.A. and the A.C.U. have raised their subscriptions. The latter is now £1, but there is no entrance fee, while motor cycle membership of the A.A. will henceforth be £1 1s., with an entrance fee of 10s. 6d. for new members.

London-Exeter Run.

Thirty-seven entries have been received for the M.C.C. annual Christmastide run to Exeter and back. As already mentioned, Peak Hill is to be included on the outward journey, and those who are not familiar with this hill will be interested to know that a warning board at the top announces that the gradient is 1 in 5. It is doubtful if the hill averages this gradient throughout its length.

Flexible Sidecar Connections.

An exceedingly interesting development in connection with sidecar attachments is the subject of a provisional patent by Mr. W. F. Grew and E. J. Hardy and Co., Ltd., of Coventry. Briefly, the Hardy patent flexible coupling, which is largely used on cars, has been interposed in the connections between the sidecar and the motor bicycle.

Economy.

Recently the makers of the Levis two-stroke motor cycle tested two of their machines for petrol consumption over a give and take course approximating twenty-five miles. One machine was standard in every respect, and, with the rider, weighed 252 lb. Its consumption worked out at the rate of 164 m.p.g. The other mount had a specially tuned carburetter, and, with driver, weighed 281 lb., yet the mileage was equivalent to 226 m.p.g. These figures are contained in the report issued by the A.C.U.'s engineer, who officially observed the test.

LIGHTER LIGHTWEIGHTS

A Consideration of Commercial Possibilities in Design.

IN January next motor cycles will be taxed on the basis of weight alone, and 200 lb. has been chosen as the figure which is to form a dividing line between lightweights and—other machines.

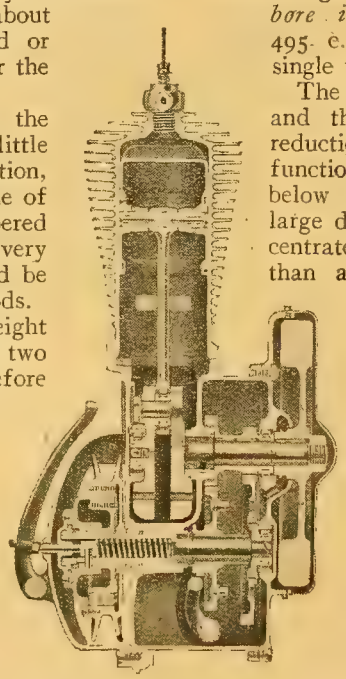
Now, there are very many machines which hover on this elusive borderline, and it behoves us to study the question with considerable care. Not only is it undesirable under any circumstances to carry about unnecessary weight, but an extra pound or two may cost us 30s. extra in taxation for the year 1921.

By the time a motor cycle reaches the private owner there is—or should be—little to be done in the way of weight reduction, so that the question resolves itself into one of design, and even here it must be remembered that the factor of price will have a very definite bearing on sales, so that it would be unwise to recommend unduly costly methods.

There are very few parts of a lightweight motor cycle where more than a pound or two can be cut away with impunity, and therefore we must be content with the example of the modern battleship, and cut ounces wherever possible.

Single or Multi Cylinder?

Perhaps the easiest way of explaining how weight can be reduced is to start with nothing but standard accessories, and see where improvements can be made without materially increasing costs. Many variations will occur to our readers, and it should be explained that the specification is intended as an illustration only, and not as a hard and fast description of the "ideal machine."



Only five gear wheels are necessary in the Clyno engine and gear box unit including the magneto drive.

To begin with, let us take the power unit and transmission, which should undoubtedly come under the same heading, since it is possible to save a considerable amount of weight by combining the two and saving extra fittings.

In spite of the fact that we are dealing with lightweights only, the type of engine is so largely a matter of opinion that it is impossible to dogmatise on this point; let it suffice to say that a two-stroke should always be lighter than a corresponding four-stroke, and a twin or multi-cylinder engine should be lighter than a single of the same capacity, *provided that the bore is not too small.* (The four-cylinder 495 c.c. F.N. was lighter than the average single with countershaft gear box.)

The flywheel is the heaviest unit of the engine, and therefore affords most scope for weight reduction, but it is required to carry out certain functions, and therefore it must not be cut below certain dimensions. Since, however, a large diameter flywheel with all the weight concentrated in the rim is very much more effective than a wheel of smaller radius, but similar weight, it is obvious that much can be gained by increasing flywheels to the maximum practical diameter.

Flywheel Sizes.

Nearly all two-strokes and many lightweight four-strokes already possess outside flywheels, but in some cases the rim sections are narrow and deep rather than wide and shallow. Plain bearings are very much lighter (and, incidentally, cheaper) than ball or roller bearings, and though I have no wish to decry the use of ball and roller bearings, which have done so much for the modern motor cycle, good cast iron or phosphor bronze bearings working on hardened and ground pins, and reasonably lubricated, will provide most excellent results. Reciprocating parts must obviously be as light as possible, for not only do heavy parts affect bearing wear adversely, but also they necessitate extra balance weights. Two small points which save more weight than would appear at first sight are the inclusion of the magneto platform

Lighter Lightweights.—

on the crank case casting, and a carefully laid out gear drive for the magneto. In this connection the little Clyno two-stroke is an admirable example of what can be done in this direction, for the whole engine and gear box contain but five gear wheels, including that on the magneto itself.

The Unit System.

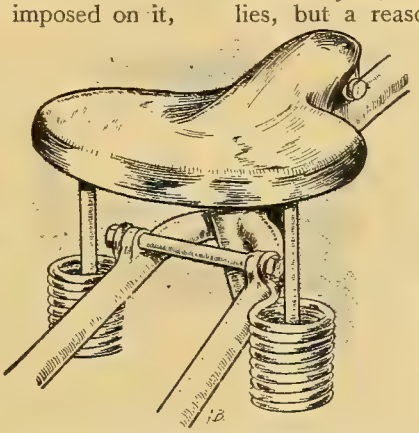
If a clutch is to be included in the specification it should be placed on the engine shaft for preference, since, in this position, it revolves faster and can consequently be made smaller and lighter than a countershaft clutch.

The combined unit engine and gear box, which is becoming standard practice on continental motor cycles, is obviously lighter than the two-unit job, since extra cradle plates and anchorages are avoided, and one wall of the gear box will serve also as part of the crank case. A difficulty arises over this point, due to the provision for chain adjustment, but if the chain is reasonably short, up to the loading imposed on it, and thoroughly enclosed *in an oil bath*, it is doubtful if such a provision is necessary. The unit system renders the enclosing of the chain particularly light and simple, and might, with advantage, be used more frequently.

It goes without saying that gears should be designed for the loading imposed, and not with the idea of being embodied also in larger engines.

Frames.

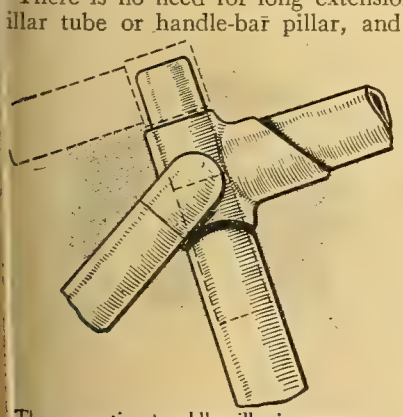
Without deviating from conventional lines, frames can be lightened considerably, though to save the maximum possible weight an unconventional frame might be advantageous.



Anchoring the saddle directly to the frame, thus dispensing with a saddle-pillar saddle frame and swivel clips.

To begin with, all frame tubes should be straight, since sudden bends necessitate liners or heavy gauge tube. Next, brazed joints can be improved and lightened if the lugs are cut off at an angle after machining, and thirdly, all clip and bolted joints should be avoided, since they entail either weight or weakness.

There is no need for long extensions on the saddle-pillar tube or handle-bar pillar, and the former may be replaced by a lug on the top tube, to which the nose of the saddle may be pivoted, while the saddle springs could be anchored from the back stays.



The conventional saddle-pillar is unnecessarily long and may be replaced by a short straight tube.

Clips should be avoided like the plague, and all necessary accessories should have their fixings brazed or welded in position. As long as motor cyclists persist in using the carrier as a passenger-carrying attachment it is presumably unwise to lighten this fitting; but if the usual pannier tool bags be replaced by a single tool case on the top or saddle tube, and the carrier be retained for its original object (*i.e.*, for a reasonable quantity of baggage), quite a saving might be effected.

Types of cut-away lug which save weight and improve the joint

Where Weight Pays.

No attempt should be made to save weight in wheels, tyres, or mudguards, since that way trouble lies, but a reasonable economy would be the provision of a maximum of four nut sizes throughout the machine, which would save considerable weight in the tool kit, since two double-ended spanners and a first-class screwdriver should be all that were necessary to undertake the complete assembly of any part.

No mention has been made of the use of special materials or unorthodox designs, since these are apt to lead to costly, and sometimes unsatisfactory, experiments. It is, however, certain from existing knowledge that a considerable saving in weight could be effected at a comparatively slight extra cost if special steels and modified designs were used in certain parts. Here, however, is a chance for the recently formed Research Association, which, it is to be hoped, it will seize at an early opportunity.

Some readers will consider that the details mentioned in this article are too trivial to merit so much attention, but I would remind them once again of that extra 30s. annually, and of the fact that it is largely through correct detail that perfection is attained.

UBIQUE.

A Guide to Olympia.

Next Week's FORECAST NUMBER.

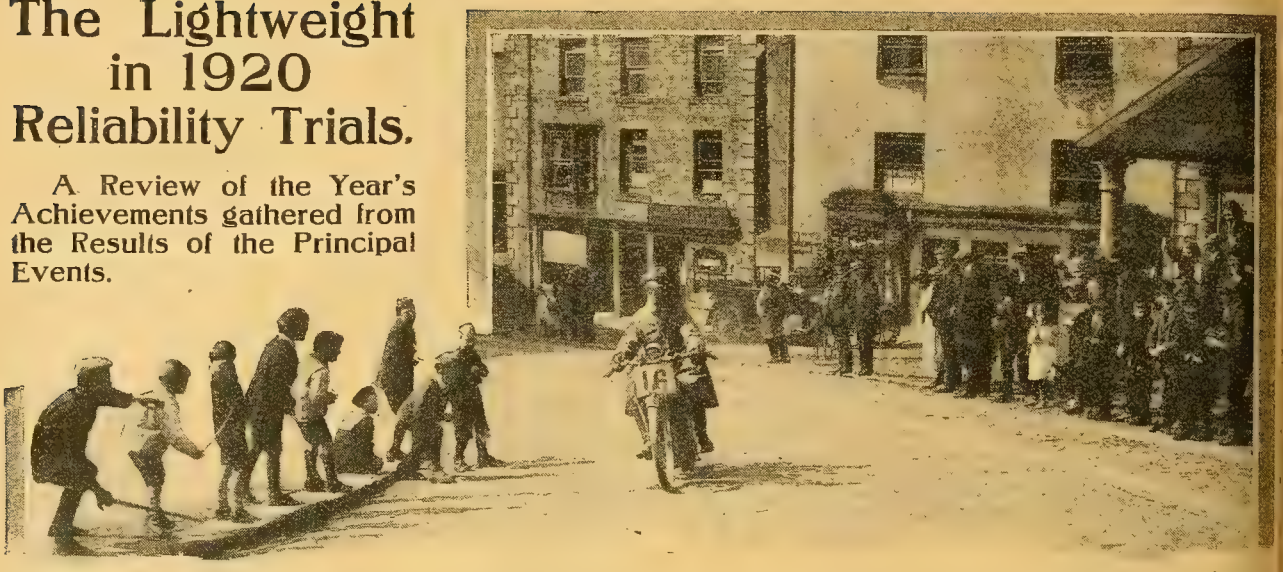
Second Enlarged Show Issue of "The Motor Cycle," dated Thursday, Nov. 25th.

A comprehensive forecast of the machines which will be exhibited at Olympia. Advance particulars of the motor cycle exhibits, and full instructions as to how to get to the Show. Fully illustrated.

In addition to the usual and well-known features, MANY SPECIAL ARTICLES are in course of preparation.

The Lightweight in 1920 Reliability Trials.

A Review of the Year's Achievements gathered from the Results of the Principal Events.



THE year 1920 has been one of exceptionally severe trials: freak hills and boulder-strewn gulleys often causing them to be more productive of protests than prizes. Indeed, the whole future of reliability trials hangs in the balance on account of this very sevrity, which throws the skill of the rider into undue prominence. But reviewing them now from afar it must be acknowledged that they have had at least one useful purpose, apart from the stock claim of "improving the breed." They have demonstrated to an extraordinary degree the capabilities of the lightweight: so much so, indeed, that many now consider that this type, solely, will survive as the ultimate solo mount.

Types of Lightweight.

The term lightweight, if taken literally, nowadays is occasionally somewhat of a misnomer: here are included all machines under the conventional 350 c.c. limit, but it is worthy of note that some of the more pronounced successes were registered by miniatures of 211 c.c. and 250 c.c.

Early in the year this was indicated, when the running of the little James and Levis two-strokes in the Colmore Cup Trial was so favourably commented on; and although neither make succeeded here in lifting a special award in competition with the heavier mounts, both probably caused riders of the latter furiously to think. Then came the Victory Cup Trial, and, repeating the 1919 success, when a Levis secured the chief prize, a small machine (a 2½ h.p. Diamond this time) gained the premier award from a field of 165, including most makes and types of machine.

A competitor on a 2¾ h.p. Wooler, in the London-Edinburgh run, leaving Ambleside for Kirkstone Pass, which was surmounted by most of the lightweight entrants.

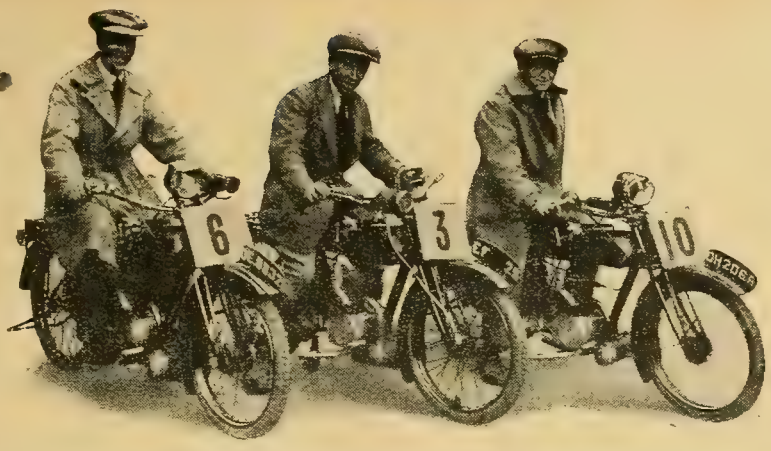
There has been a tendency of late years to regard the classic London-Edinburgh run as an annual joy-ride where a "gold" was but the recognised barter for an entry fee; but this year the inclusion of Kirkstone Pass considerably upset this comfortable viewpoint. Therefore, the presence of a genuine lightweight, the Levis, amongst the only six firms to gain 100% success is an excellent tribute both to the type and to Messrs. Butterfields, whose product, a pioneer in its way, has done incalculable good in removing public prejudice against small machines.

Although not a reliability event in the popular fancy, the T.T. is actually the most strenuous trial of the year, and R. O. Clark, on the 2¼ h.p. Levis that gained *The Motor Cycle* Cup, probably did more than ever before to remove last lingering doubts as to the staying powers of the microscopic two-stroke engine.

"Freak" and Genuine.

With a 350 c.c. engine another make, the 2¾ h.p. Wilkin, driven by its designer, G. W. Wilkin, made an outstanding performance in the Ilkley Trial, an event which was frankly a "freak" event, and which, according to many of the entrants, was the most "impossible" of all such competitions. One of the very few first-class certificates went to this machine. Close on the heels of the Ilkley scramble came the Scottish Six Days, which is recognised as the most "honest" test of the year. And here the little Clynos showed that Scottish passes are nowadays no more a deterrent to the two-stroke than to its heavier 3½ or 8 h.p. brothers. In fact, the weight of the latter is sometimes an awkward factor on "tricky" routes.

Lightweights in 1920 Reliability Trials.— Although outside the trials classification in the strictest sense of the word, mention must be made of the attempt by the Ivy people in July to prove that their 350 c.c. two-stroke engine maintained its power even after a long period of heavy output. They demonstrated this by making twenty-five consecutive ascents of the Old Wyche, and later by fifteen ascents with side-car and passenger. A notable performance.



The Velocette team are naturally all smiles after their outstanding success in a trial over 1,000 miles of the worst roads in England. They were placed third for the Manufacturers' Team Prize against all comers in the 1920 A.C.U. Six Days Trial.

A Fitting Climax.

But perhaps the finest performance of the year was that of the Velocettes in the A.C.U. Six Days Trial in August. For a team of three 220 c.c. two-strokes (the Velocette) to finish third for the Manufacturers' Team Prize is such a keenly contested and severe competition, conclusively proves that a lightweight may be made that justifiably deserves the title of "go-anywhere mount." The 2¾ h.p. Wilkin again did well here: and also in that cinema stunt-like scramble, the Scott Trial, which followed. Indeed, the Six Days event this year was somewhat in the nature of a lightweight triumph. Although the basis of the awards was admittedly lower in the smaller capacity classes, two lightweight riders, B. Kershaw (2¾ h.p. Verus) and R. B. Clark (2¾ h.p. Coulson B) finished "+4" and along with the twelve other gold medallists in this class deserve great credit. Mention of the Verus reminds one of how consistently this machine has run throughout the season (and special awards, after all, are often a matter of luck or "stunting"). The same may be said of the O.K. Junior, with special emphasis on its moderate selling price, of the Royal Enfield, of the New Imperial-Jap, and, of course, of the ever-popular 2¾ h.p. Douglas,

Two riders of O.K. Juniors in the 1920 A.C.U. Six Days Trial. (Left) N. M. Hall on Keighley Hill, and (right) W. L. Handley, near Alston. These popularly-priced lightweights made a fine performance here, and also in the M.C. and A.C. Open Trial in October.

The Lightweight in 1920 Reliability Trials.—

although the latter machine has not been officially entered in many competitions this year.

Petrol Consumption Tests.

In a somewhat different category from the big endurance trials we have been dealing with, the petrol consumption test, albeit usually a closed club event, is valued by the general public, especially the non-motoring public, perhaps more than a purely reliability event. The economy of the lightweight usually brings it into prominence here, and some remarkably fine consumption figures, in some cases more than 200 m.p.g. for machines up to 2¾ h.p., have been recorded from time to time in our "Club News" pages.

Several trials lately were confined solely to lightweight machines, and one or two were really stiff tests (*e.g.*, the Birmingham M.C.'s trial for the Olai award, won by G. Kuhn on a 2¼ h.p. Levis): but, obviously, they must be disregarded here, for in each case a "lightweight success" was the only possible result.

This review by no means exhausts the roll of honour of the lightweight—practically every 1920 trial, open or club, furnished some example of the smaller machine, if not beating, at any rate equalling, the field—but it touches the majority of the more important and therefore more difficult events.

If the general public scrutinise trials results and reports they need no longer be afraid of buying a "pup."

Lightweight Motor Cycling for Beginners.

A Few Useful Words of Explanation to those who Contemplate taking up the Pastime.

AFTER a few years of pedal cycling a man's fancy turns to thoughts of motor cycles. This state of mind generally attacks him when he is passed by a motor cyclist as he is slowly grinding away up his favourite "de-test" hill. Or if he be very young, possibly the idea is engendered by the impression he thinks he can create on his friends, especially on those of the pillion sex, to whom his new machine is bound to prove an irresistible attraction.

Whatever the reason, the fact remains that "he wants a motor cycle"—and means to have one. Now, various questions arise, regarding price to be paid, make and type of machine, new or second-hand, which combine to cause the novice some perplexity. Unless he happens to be one of those fortunate persons whose friends all own motor cycles, and so has had the benefit of their experience, or one of that still more fortunate class to whom money is no object—a little guidance on these points will be very welcome to him.

First and foremost the novice should consider the following points. For what use does he require the machine? Should it be new or second-hand? Two-stroke or four-stroke?

New or Second-hand.

Dealing with our first interrogation, does he want a machine as nearly like the old push cycle as possible, *i.e.*, a real lightweight of simple design and construction to ride to business daily and for short week-end runs into the country; or does he want a more powerful 'bus capable of exceeding the speed limit and suitable for all day non-stop runs, and which will have no objection to having a sidecar attached? Probably the beginner will decide that as it is only once a year that he would be able to enjoy to the full the advantages of the latter type, it would be useless having a heavier and more powerful (not to say expensive) machine, when his requirements will be fully met by the simple lightweight.

That point settled, the question of new or second-hand has next to be considered. In this case, expense is bound to be the deciding factor. A new machine is nicer and better, of course, than an old one, but, at the same time, it is quite possible to reduce the outlay considerably, and still obtain a machine in good order and condition, by looking out for a mount from one to three years old that has been well treated. Earlier machines can be purchased cheaper, but as they are usually in worse condition they are not such good value, and should be left alone by the novice. He will probably decide upon a second-hand mount "to learn on," with the ambition of exchanging it for a brand new machine the following year.

Other Details.

Now as to type—two-stroke or four-stroke engine, change-speed gear box or direct belt drive? The difference in the type of engine is mechanical—both will work equally well and give complete satisfaction. In the four-stroke engine the petrol gas is admitted to and permitted to discharge from the cylinder by means of mechanically-operated valves, which enable one explosion or power impulse to take place to every fourth stroke of the piston, that is to say, once every two revolutions. In the two-stroke engine there are no valves, the gas being admitted and ejected through holes or ports provided in the walls of the cylinder, which are opened and closed (uncovered and covered) by the travel of the piston. This enables a firing or power impulse to occur on every second stroke of the piston (once every revolution). Hence the names, two or four-stroke. Now the absence of valves means the absence of attendant valve gear, and the result is that the two-stroke is a much simpler and lighter engine than its fellow, having fewer parts to need attention.

As regards gears, here we must be guided by the physical condition of the rider. For the active man the single speed is perfectly satisfactory, especially with a two-stroke engine, but if the rider does not want to run and jump on, or even to paddle off, and wishes to be certain that no hill will ever be too much for his mount, then he should go in for a two-speed model fitted with clutch and kick-starter. This will enable him to sit on the saddle and glide away, uphill or down.

But we will suppose that our novice (as a cyclist being fairly active) decides that a single-speed two-stroke lightweight will meet his requirements. A machine of this type is the essence of simplicity.

The minor details incidental to one's first machine will soon be overcome, and he will be the proud possessor of a means of easy and economical locomotion—the enjoyment and exhilaration of which will exceed his greatest expectations.

R. BUXTON.

All letters must be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

THE W.D. PONCHO COAT.

Sir,—In reply to your correspondent, Mr. H. F. Birt, who enquires, in your issue of November 4th, whether the W.D. poncho coat is now obtainable, I recently purchased one of these from Messrs. Jones Bros., of Holloway Road, London, N., who deal extensively in ex-W.D. stores.

Withington. HOPLITE.

BABY ON TOUR.

Sir,—Having read the letter of Mrs. R. J. Carter on "Baby on Tour," I decided that I would write you *re* our own child. She began coming with me in the sidecar at the tender age of six weeks. She was five years old in August this year and up to writing baby's mileage works out at 15,000 miles. When she was very young, and nothing would induce sleep, she would be wrapped up, rushed through the air for half an hour, coming home simply snoring. So we can recommend motor cycling for *all* babies. She asks the boy each Friday morning for *our Motor Cycle* book, and talks motors whilst sat on the ever glorious road. Our steed is called by girlie "dear old Jimmy" (James). The only precaution I have ever taken against the wind (we have no windscreen) was advised by a medical friend, viz., a veil over the eyes.

Wishing your paper every success,

(Mrs.)—J. J. HOLDCROFT.

TWO-STROKE STARTING TIP.

Sir,—The following little device for rendering the starting easy on a two-stroke fitted with a B. and B. carburetter, and running on the petroil system, may be of interest to some of your readers.

Obtain a short length of black garter elastic, ¼in. wide, and make a ring to slip on the dome at the end of the extra air inlet so as to cover the holes cut therein.

It will be found that the very rich mixture thus obtained will start the most obstinate engine in a few yards.

As soon as the engine four-strokes, engage the top gear, when it will resume two-stroking for a short distance, but will quickly four-stroke once more. When this occurs, remove the elastic ring, and place it on the handle-bar grip, where it will remain quite out of the way and almost invisible until it is again required. D.L.

Chelsfield, Kent.

WHERE ARE THE OLD 3½'s?

Sir,—I read with interest the description in your issue of October 21st of how modern machines in skilled hands failed to conquer Chalk Pit Hill.

I first encountered this hill (I had never heard of it before) when cruising round one afternoon in 1914 on a touring single gear fixed engine 1909 Triumph. Charging up the unknown one with my touring ratio of 4¾ to 1, I was, of course, pulled up at the sudden right angle turn. Returning 200 yards, I adjusted the pulley to a gear of 5¾ to 1, and was successful in reaching the summit without putting a foot to the ground. Admittedly, that was on a "summer" surface.

I notice your report says it was difficult enough to stand on the hill. It will interest all who saw the hill during this trial to learn that a certain squad training at Oxted in January, 1915, was daily marched up Chalk Pit Hill at 120 to 130 r.p.m.—timed. (The surface was not "summery" then. I was not in that squad.)

While training there I rode a 2½ h.p. Villiers-engined Royal Ruby, which never once failed to take Chalk Pit Hill on a low gear of 10 to 1 in mid-winter. E. M. WRIGHT.

BEATING THE PUNCTURE FIEND.

Sir,—The letter of "Never Again" is truly remarkable. During the many thousands of miles I have motored (with a sidecar) I am quite sure I have not averaged one puncture per 1,000 miles. There are only three possible explanations of his experience. (1.) He may be using absolutely unsuitable tyres. (2.) They may be fitted wrongly and used wrongly. (3.) He may be the victim of the most appallingly bad luck I have ever heard of, which quite obviously will not continue.

At a time when there is quite a definite movement to replace solid tyres by pneumatics on even heavy commercial vehicles, such as chars-à-bancs (because of their undoubted advantages in several directions), his opinions appear very strange.

I hold no brief for the puncture-proof tyre or tube, but since I fitted a puncture-proof tube to my back wheel (in a well-worn Dunlop outer cover) I have not had a single puncture—or rather, let me say, I have never had to blow up my tyre. U 11.

Leeds.

Sir,—To my mind, "Never Again," in his tirade against pneumatic tyres in your issue of November 4th, is unwisely complaining of his tools.

When I took up motor cycling in 1909, an experienced friend warned me to keep my tyres pumped decently tight, and to have my outer covers retreaded before getting almost down to the canvas, if I wanted to avoid punctures. This I did, and this is an almost certain puncture preventive, or else I have been exceedingly lucky. I have had three machines, the first a heavy four-cylinder solo, the other two sidecar outfits. I forget how many miles I rode the first before selling, but I never had one puncture. My first sidecar was equally successful, until I broke my own rules and used an outer cover which was badly worn. As a result I had punctures and a burst, got a new cover and had no further trouble.

On my present 8 h.p. outfit I have so far done only 3,700 miles, with no punctures at all in spite of the bad roads.

Of course, these precautions are not proof against flat-headed nails standing point up, but even these can be rendered harmless by the M.P. Puncture Preventer.

Personally, unless "Never Again's" alternative gives the same resilience and comfort as a pneumatic tyre, I, for one, shall retain my "air-bound wheel." C. TYERS.

Sir,—Having read "Never Again's" lament on the subject of pneumatic tyres, I should like to say that my experience has been very different. I use nothing but Palmers with Avon tubes, and have nothing but praise for both. Recently I ran from Edinburgh to Haverfordwest in South Wales, and did not touch a tool of any sort. This is on a home-made 'bus, including engine and wheels.

In conclusion, would it not be much better if "Never Again" were to slow up and render assistance, if necessary, than to "smile a superior smile"?

S. G. MASTERMAN.

TORQUE AND COMFORT.

Sir,—In answer to Mr. A. Newsham's letter in the issue of October 28th, in which he asks for opinions of readers as to the possibilities of the double-acting motor cycle engine, I beg to submit what, in my opinion, would be the most obvious defects.

A very desirable feature of a motor cycle engine is simplicity, but, unfortunately, up to now this cannot be claimed for the double-acting motor. An engine of this type

introduces a bottom end cylinder cover and piston rod, which involves a gastight piston rod gland. It is at this point that the rider would have trouble. The piston rod being exposed to the direct action of the flame would become carbonised, scouring of the gland and the destruction of the packing would follow, with an immediate loss of compression and misfiring on the piston rod side, thus destroying the only advantage the engine can claim (*i.e.*, more uniform torque). A very efficient method of cooling would be necessary, involving the cooling of the piston rod as well as the cylinder. Unless this was so, distortion of the piston rod would take place, this being due to the temperature changes in the rod.

It must be remembered that the same degree of uniformity of torque can be obtained in a single-acting two-stroke as in a double-acting four-stroke, and at the expense of a much less multiplication of parts.

Mr. Newsham does not say whether the engine he has designed is a double-acting four or a double-acting two-stroke. However, this letter is not intended to criticise the engine, as, in the absence of further information, it may be assumed that Mr. Newsham has foreseen and in some way guarded against these inherent defects; but this must not have been done at the expense of complications, or the disadvantages would outweigh the advantages.

Now, with regard to springing, it is my opinion that, no matter what perfection in uniformity of torque is reached, this does not in the least eliminate the necessity of springing a motor cycle frame. This is, and will remain, an engineering problem of importance. R. H. ARCHER.

AN ENTHUSIAST'S MINIATURE.

Sir,—I enclose a print of a miniature motor cycle which I finished in February last. I have covered about 1,200 miles, and it has given excellent results. The design is original, and a sound engineering proposition. (I have been managing engineering works over twenty years.) Details might be of interest to some of your readers who are looking for a job during the winter months.

A neat little machine constructed in the spare time of one of our readers. (See letter from "Mac.")

The frame is built up of light steel channel and angle sections bolted together; the only brazing about it is the usual type of cycle fork crown. Wheels, 20×1¾in.; wheelbase, 4ft.; height, saddle to ground, 27in. (adjustable); Brooks B130 saddle; engine, 1 h.p. Auto-Wheel, altered to ⅝in. V belt drive; lubrication, sight feed drip regulated by cock below small tank; minimum and maximum speeds, 3 to 24 m.p.h.; petrol consumption, 140 m.p.g.; total weight, tanks full (½ gallon petrol, 1 pint oil), 65 lb. It can be dismantled and packed in a box 26in. square, and reassembled in twenty minutes. MAC.

HAND SIGNALS ON GREASY ROADS.

Sir, I am very interested to see "Ixion's" remarks in his "Occasional Comments" on November 4th, with regard to hand signals whilst riding on greasy or wet roads. T is an important question, and one which, personally, I grea appreciate, as indeed must most other practical motor cycli who have given the matter any thought.

I am a daily and all-weather solo rider (Douglas 2¾ h. from Staines to Kew Bridge *via* Hounslow, Isleworth, a Brentford (which is a terribly trying journey on a greasy da and I certainly entirely agree with "Ixion" that it impossible on wet wood block roads (and tramlines) to move a hand from the bars for an instant in order to sig to other traffic without very grave risk of a bad skid sideslip.

If signals to other traffic are made compulsory, some eas operated signalling device worked from the bars will essential.

Incidentally, can "Ixion," or any other old timers, g any good hints for the prevention of skidding on greasy wo block roads or wet tramlines? These would be appreciat by DUGGIE.

Egham.

Sir,—I am under the impression that a very similar type road signal is being used to denote two different actions, a on occasion it is difficult to distinguish what is meant. Th are (1) the waving of the arm from rear to front, meani "come on," and (2) the usual "turn to the right" signal.

I was overtaking a lorry, which was slowly proceeding the same direction as myself, when I observed the driver slow and give me what I have above described as "the come o signal. On my coming on, and as I was about to pass hi he suddenly turned sharp right to proceed down the s turning. I was forced off to the right, and made an endeavo to proceed in his direction. I failed to get round and stru his radiator.

Afterwards, whilst giving me a lift to the nearest stati the lorry driver stated he had simply stuck out his arm denote that he was turning right, and although he had se me coming he imagined I should pass him on his inside.

The first thing he knew of my proximity was when crashed. Of course, he had complied with ordinary rd usage, and I had to admit I had misunderstood his signal. was, of course, doing more speed than the lorry—in fact, t accident was caused by my failure to distinguish between "wave, or come on signal" and the waving of "I about to turn."

Can anyone suggest more distinct signals? GARFIELD. North Kensington.

Sir,—May I ask you, in the interests of fair play a sportsmanship, to allow me space for a word of frien protest against a point in the otherwise excellent letter "B.Y.6617" on "Hand Signalling" in the issue for Nove ber 4th? I merely mention "B.Y.'s" letter as one of ma in which the same point has arisen, and instance it as "test case" as it were, and, I readily admit, a very m one.

There has unfortunately arisen a general mutual antipat between cyclists and motor cyclists, based on each s upon the bad manners of a section of the other. May I allowed to mention that as a motor cyclist and an engin I am keen on all appertaining to motors, and, on the ot hand, as a lover of sport depending on exercise and for m other reasons, am also a keen cyclist, and divide my sp time between the two pursuits. I also read regularly journals of both, and therefore am in a position to appreci impartially the views of both sides.

Although at the present time a great number of irresp sible and ill-mannered people are abroad on cycles, same remark applies with equal force to motor cycles. decent and sportsmanlike members of such famous cycl clubs as the North Road, Anfield, etc., as well as thousa of well-intentioned unattached cyclists, resent bitterly imputations of some motorists that to cycle is to be a c and equally the respectable members of motor cycl fraternities resent the idea of some ill-conditioned cycl that all men in goggles and overalls are "road hogs." Al all, there are good and bad in all walks of life, and to da a whole class on account of the misdemeanours of a co paratively small section of its members is, to say the le unsportsmanlike. I venture to suggest if motor cyclists cyclists were to halt by the roadside occasionally and change ideas, neither would find the other to be the u outsider he had thought him. I exclude altogether

'pedestrians on wheels" who, without thought or interest or their machines of either type, use them simply as hacks o save 'bus fares. It is among this class of "cyclist" and 'motor cyclist" that exist the black sheep who cause, hrough their ignorance and carelessness, the bad feeling etween the "genuine article" of either side.

ARTHUR G. BANKS,
B.Eng., A.M.I.C.E., Lieut., R.E.(T.).

ENZOLE-PARAFFIN MIXTURE.

Sir,—*Re* Mr. Sharp's enquiries in your issue of October 8th, concerning benzole-paraffin mixture, perhaps my experiences will be of value to him. I have tried various mixtures n all types of internal combustion engines, ranging from the ½ h.p. two-stroke to the 25 h.p. Mogul tractor. The results re interesting, since I find that the former, a petrol engine, annot be induced to run satisfactorily on pure paraffin, while ne latter, a paraffin engine, runs very efficiently on pure enzole. Proportionally as the engine gets larger, and slower nning, so will it burn a mixture containing more and more araffin without heating the induction system.

I find that the 2¼ h.p. two-stroke will run quite well on a 0% paraffin mixture, provided that the air given be about ⅓% more than with Shell 1.

As tractors are outside the scope of this journal, I will oceed to other motor cycles that I have experimented with. n old 4¼ h.p. Bradbury ran perfectly with a mixture of 33⅓% araffin, used with a 27 jet, and air lever full open for normal nning, closing it to about one-third open for hills. Simiarly with a B.S.A. with an Amac carburetter and 26 jet.

There is no need to multiply instances, as all my experiences to show that any four-stroke and most two-strokes will run a mixture containing not more than one-third paraffin with nzole, and not more than a quarter paraffin with petrol, ovided, *(a)* a reasonably small jet be used, *(b)* the air ver be used intelligently, and *(c)* (most important) the gneto timing be retarded about half a tooth and the lever elf retarded on the first symptoms of knocking.

It should be borne in mind that paraffin tends to detonate a hot engine, hence the retardation of the ignition; it o tends to destroy the lubricating oil, therefore slightly re is required. Note "*slightly*," otherwise sooted plugs ll result.

TRACTOR.

Bow, E.

NS MAGNETO.

Sir,—I do not think that any of your correspondents on s topic have referred to the Bolinder or semi-Diesel gine, and the principle of this engine probably supplies explanation of the "S.M." phenomenon. These engines generally of the two-stroke variety, and their designed mpression is probably in the neighbourhood of 250 lb. per uare inch, but there is no doubt that they will run at a ch lower compression than this, as they will go on runng when in a very bad condition. The charge is fired a red hot bolt in a hot bulb, originally heated by blowp and kept hot by the subsequent explosions. In the e of a motor cycle, the lower compression is compensated by a more combustible fuel of petrol and lubricating , which is fired by some red hot projection in the cylin-. I should expect the "S.M." condition to be brought by a combination of full throttle driving and copious rication. Old readers of *The Motor Cycle* may remember correspondence on "abnormal running" of four-cylinder N.'s, and I believe the explanation of this is practically same, even though they would respond to the magneto out. I often experienced, when running at full speed der favourable conditions (about 45 m.p.h.), a sudden and inite increase of 8 or 9 m.p.h., the only explanation of ich can be increased power from burning lubricating oil.

As a Scott rider, I am most interested in its performces in trials. We are so frequently hearing about the tt's prowess on hills, that I feel tempted to ask whether makers test their sidecar combinations on these mounnous roads, as it is all I can do to coax mine over ordinary in road hills, loaded with a ten stone passenger and a derate supply of luggage. My experience is identical h that I had with my four-cylinder F.N.'s. With a low r of 12-1, they would go practically anywhere, and so pressed was. I with their hill-climbing capacity that I ed a sidecar, only to find a peremptory demand for low r at every pimple. An "even torque" machine will do nders on a low gear, but they suffer badly from "fussiness," especially some twins which vibrate abominably at speeds over 12 m.p.h. on low gear. Petrol consumption has to be watched, and I feel that an 8 h.p. four-stroke would get me there faster with the same amount of petrol.

H. E. RENDALL.

ELECTRIC LIGHTING.

Sir,—Perhaps my experience of electric lighting may be of some use to others. I will commence with the accumulator. This should be of the 4 volt 40 ampère hour size, and must be constructed on the Fuller block principle, or, as an alternative, the elements should be cylindrical in shape, with the "positive" cylinder inside the negative, and insulated from it by a porcelain cylinder. This is a very reliable type of accumulator indeed, will withstand any amount of road shocks, and a "dead short" does not appear to harm it in the least, as I found, after discovering that a file which I had been using had found its way across the two terminals, and was too hot to handle with any degree of comfort. I have also dropped this accumulator on three occasions, the only damage being a bent lug, the cylinders not even shedding any trace of paste. This type of accumulator is manufactured by the Erith Battery Co., of Belvedere, Kent.

As regards the wiring, well, I have tried all kinds of "twin flex" and "C.T.S.," but I cannot find any to beat the brass armoured twin cable, supplied by the C.A.V. for cars.

The bulbs should be of the miniature bayonet cap type, with a spiral filament, of similar design to the filament used in the construction of the half-watt lamps, as I find the filaments shaped as an S will not withstand the vibration. I do not recommend the 2 volt pea lamps with the Edison screw First, because they are too fragile, and, secondly, the vibration has a tendency, in time, to unscrew them, thus extinguishing the light immediately the centre contacts part. For the head lamp an 8 watt bulb is advisable, and the side and tail lamps are quite sufficient when served by 2 watt lamps.

Now, as regards the layout, I am afraid your correspondent has not sufficiently grasped this principle, otherwise he would not complain of spilled acid, damaged shoes and skirts, etc. The ideal position for the accumulator is underneath the sidecar seat. The accumulator should be fitted with good fitting conical shaped rubber vents which have the glass tube with bulbous end passing through the centre, as an air release, and I can confidently state that it is absolutely impossible to spill any acid. I constructed a box for my accumulator, allowing a space of ¼in. on all sides, and after putting a layer of sawdust to the depth of ½in. in the bottom of the box bedded in the accumulator, by compressing the sawdust round the sides. The sawdust has a dual capacity. First, it acts as an insulator from road shocks; and, secondly, it absorbs any spilt acid. The accumulator is held in position by a brass strap, passing round the box, and bolted to the sidecar panels. The strap need not be a binding fit, otherwise it would be difficult to lift the box out of the sidecar when the accumulator needed recharging. To the lid of the box I have secured a small distribution board.

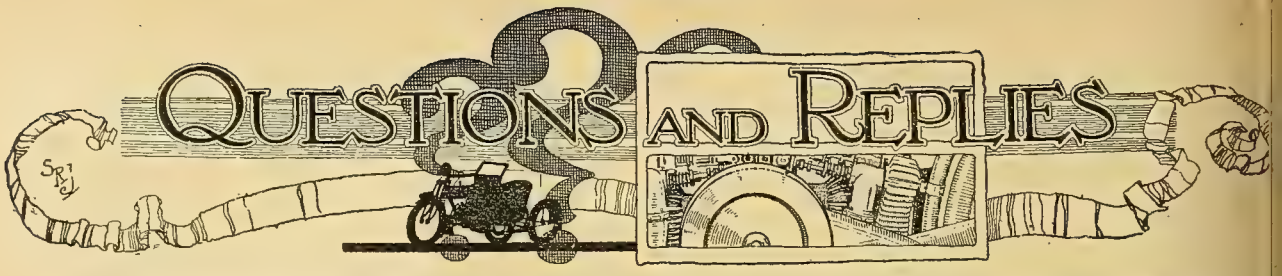
T.D.L.

BOOKS AND MAPS FOR MOTOR CYCLISTS

Issued in conjunction with *The Motor Cycle*.

	Price net.	By post.
"MOTOR CYCLES AND HOW TO MANAGE THEM." The standard handbook of the motor cycle. Covers every subject relating to all types of motor cycles, their management and care. Twenty-first Edition. Just published	2/6	2/10
"HINTS AND TIPS FOR MOTOR CYCLISTS." Containing over 400 useful "wrinkles" and helpful hints in regard to motor cycles. Seventh Edition.	2/-	2/3
"TRACING MOTOR CYCLE TROUBLES." A reliable system for tracing motor cycle faults and of remedying any trouble when found. Fourth Edition.	2/-	2/3
"THE MOTOR CYCLE" ROAD MAPS **England and Wales, Scotland. London** (showing roads into and out of London and avoiding London). Mounted on linen. Set of three, complete in case.	5/6	5/10
"THE MOTOR CYCLE" ROUTE BOOK. With 32 pages of Road Maps of England and Wales, Scotland, and the London District. New Edition. Just published	5/-	5/4

Obtainable by post (remittance with order) from ILIFFE & SONS Ltd., 20, Tudor Street, London, E.C.4, or of leading Booksellers and Railway Bookstalls.



A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C.4, and whether intended for publication or not **must be accompanied by a 2d. stamped addressed envelope for reply.** Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

How to Change Gear.

What is the correct method of changing with a plain two-speed countershaft gear?—L.C.B.

When changing from low to high gear, throttle down the engine and lift the exhaust valve while moving the gear lever. When changing from high to low there is no actual need to lift the exhaust at all, merely throttle down a little and push the gear lever over quickly.

Building a Miniature.

Do you think an Auto-wheel engine, if properly geared, would be a success in a light motor cycle? Would it be powerful enough for ordinary touring? My weight is 10 st. What is the most suitable gear if a countershaft drive be used?—R.E.

An Auto-wheel engine would be quite satisfactory as the power unit for a miniature motor cycle, provided you do not expect extraordinary results from it in the way of hill-climbing. It should be geared about 6¾ to 1 or 7 to 1. It would answer quite well in moderately level or undulating country. We do not know of any countershaft gear which would be suitable for use in conjunction with it.

Accumulator to Dynamo.

I have an accumulator lighting set on my sidecar outfit, and have recently purchased a dynamo. (1.) Can you inform me how to wire up, using four lamps, separate switches except head and tail, voltmeter and ammeter? (2.) Is it absolutely necessary to have an automatic cut-out, or would an ordinary switch serve the purpose, provided one remembers to switch it off when the dynamo is not running.—F.A.V.

(1.) As you do not say what type of dynamo you have obtained, we cannot advise you upon its suitability for motor cycle use, nor can we give you any wiring diagram. Presumably, however, the lamps should be wired in parallel with separate switches on each circuit (it would be much better to connect the side and tail lamps in series on one of the circuits rather than have head and tail together as you propose.) The accumulator must be connected across the dynamo terminals if the dynamo is one specially designed for motor cycle use; it should not be necessary to have either a voltmeter or an ammeter. (2.) If the dynamo commences to charge at very low speeds, an automatic cut-out is not absolutely necessary, provided you remember to switch off as soon as the engine stops.

Valve Replacements.

(1.) I have made two valves of mild steel, and am going to case-harden them. Will they stretch so much as to prevent the valve properly closing? (2.) Also, my exhaust valve seating has worn nearly $\frac{1}{16}$in. below the top of the casting. Would it be advisable to turn down the top of the casting?—J.A.N.

(1.) The valves do not need to be hardened. Three per cent. nickel steel would be better than mild steel. (2.) If the exhaust valve seating is worn as you describe, it would be advisable to turn down the casting until the valve seating is level again.

IMPORTANT DATES.

Nov. 29th.-Dec. 4th—
Olympia Motor Cycle Show.

Dec. 10th - 19th—
Brussels Show.

Dec. 27th-28th—
M.C.C. London-Exeter Run.

Jan. 28th to Feb. 5th, 1921—
Scottish Motor Exhibition, Kelvin Hall, Glasgow.

Balance.

Will you kindly inform me: (1.) Whether a motor cycle engine should balance when at rest or not? My 3½ h.p. Rover requires 6 oz. opposite the crank on the rim to balance it; or, if I replace the piston by a weight which is about 16 oz. lighter it will then balance. (2.) Is power lost through a badly balanced engine?—C.E.C.

(1.) When the cylinder is removed the piston will invariably go down to the bottom of the stroke. Usually, in the balancing of single-cylinder motor cycle engines the balance weight (at the same mean distance from the main shaft as the crank pin) equals the total weight of the rotating parts plus half the weight of the reciprocating parts—that is, the weight of the big end, crank pin, and lower half of the connecting rod, plus half the weight of the remainder of the connecting rod small end, gudgeon pin, and piston. (2.) If the engine is incorrectly balanced power is lost, owing to excessive vibration. You can take it, however, that if the engine is as delivered by the makers it is suitably balanced, and it is not advisable to make alterations.

Taxation of Three-wheelers.

Will you please tell me what the tax on an 8 h.p. Morgan the present time and also what will be under the new regulatio next year? What is the diff ence on a 10 h.p. model?—W.J.A.

Under existing laws the Morgan (irresp tive of horse-power) pays the same tax a motor cycle, namely, 20s. annually, b the registration fee is 20s., as for ca Commencing January 1st, 1921, the t on the Morgan and similar three-wheel under 8 cwt. will be £4, irrespective horse-power.

An A.I.V. Flat Twin.

I have an early model Doug motor cycle in which all timi has been lost on overhauling (t timing wheels being inside t crank case). Would you be kind as to advise me what to do?—D.

As the inlet valves are automatic, y can disregard them. Set the exha valve of each cylinder so that it clo when the piston reaches the top de centre of the outward stroke. The ig tion should be timed, so that the cont breaker points just commence to separ when the piston reaches top dead cent of compression stroke with the magn control two-thirds retarded.

When to Decarbonise.

I want advice re my 2¾ h Omega-Jap. I am a novice, wi a four-stroke, and I only pu chased it (new) some five wee ago, and it goes perfectly, though at present the engine g exceedingly hot. I have complet about 600 miles, and have given excess of oil to run it in. Does t machine need decarbonising yet? L.C.B.

It would probably be advisable to dec bonise the engine if you have been ov lubricating, but under normal circu stances it should run 1,000-1,500 miles.

U-NEAD-IT

VULCANISING & PATCHING ABSOLUTELY SUPERSEDED.

No more burnt tubes or patches peeling off.

One Outfit (motor cycle size) 3/- will repair **50 PUNCTURES**

TYRE REPAIRS SIMPLIFIED.
NO HEAT OR TOOLS REQUIRED.
Makes a permanent repair to covers & tubes.

The filling material is a plastic compound, which on being pressed into the puncture with the finger dries very quickly, and makes a weld with the surrounding rubber of the inner tube. In the case of an ordinary puncture, the tube can be placed in the tyre and pumped up immediately after the repair, and the pressure of air in the tyre, and heat generated while on the road only results in further homogeneity of the filling compound. To deal with a cut in the outer cover, the same process of repair is gone through. The "U-nead-it" outfit is sold in motor cycle size at 3s., cycle size 1s. 3d., and a car size at 5s. 6d. Postage, 4d.

COULSON-B

MORE TRIUMPHS!!

9 World's Records!!!

¶ To its ever-lengthening list of successes, the Coulson-B now adds a special award in the Ballards Cup Trial, on October 30th, for best performance with 350 c.c. and Sidecar—this in addition to

15 Gold and Silver Medals,

and various other awards this season.

¶ In addition, for 350 c.c. and Sidecar, Coulson-B now holds the following 9 World's Records (Capt. M. C. Breese, at Brooklands, Sept. 2 and Nov. 4):

50 miles	...	average 40·95 m.p.h.
100 miles	...	,, 39·69 ,,
150 miles	...	,, 38·89 ,,
200 miles	...	,, 38·52 ,,
2 hours	...	average 39·62 m.p.h.
3 hours	...	,, 38·25 ,,
4 hours	...	,, 38·72 ,,
5 hours	...	,, 38·45 ,,
6 hours	...	,, 38·35 ,,

¶ Thus has the spring-framed Blackburne-engined Coulson-B demonstrated its qualities under the most strenuous and convincing tests.

¶ See riders' opinions reproduced herewith.

"Having ridden a Coulson-B Motor Cycle over 4,000 miles this season, including many severe trials over the worst roads to be found in the British Isles, I feel I must write you a line in appreciation of the excellent springing of the machine. I find I can ride fast over the worst surfaces without feeling that the machine is being shaken to pieces. Also luggage remains on the carrier and tools do not chafe through the tool-roll and wreck the toolbags, as is usual in unsprung machines. The absence of fatigue after a long run is very marked, and owing to its simplicity, the springing gives no trouble whatever. The tyres wear remarkably well, due no doubt to the absence of bouncing and wheel spin."

"I would add that your machine is 'the goods,' and I would not exchange for any other 2¾ h.p. on the market. The engine is a marvel and the springing a revelation."

"The machine itself I am well pleased with; the engine is one of the best singles I have had, and the spring frame is admirably conceived."

F. Aslett-Coulson Engineering Co.

(Proprietors: Flightcraft, Limited),

THIS INTERESTS ALL INDIAN RIDERS.

S. J. Redmond, Famous Indian Rider, 10/10/20, writes about

SPEEDWELL

"I used your oil when I won the 50 Mile Championship of Ireland at Magilligan.
I have used 'SPEEDWELL' all the Season for Road Work, and so have most of my customers. Bearing in mind how hard it is to please everybody, it is extraordinary to find a UNIVERSAL CHORUS OF PRAISE FROM ALL USERS.
THE ENTIRE ABSENCE OF ANY TENDENCY TO 'GUM UP' WHEN COLD is always commented upon. Something better MIGHT come along. Until it does I am 'Nap' on 'SPEEDWELL.'
On a test over a flying mile on the road some few weeks ago I used your ordinary Motor Cycle Oil, and clocked 76 miles per hour on my 3½ h.p. Indian."

SPEEDWEEL OILS are stocked at all leading garages. Insist on "SPEEDWELL," and get better results.

Starting out on a UNIBUS.

Note how complete the protection for the UNIBUS rider.

Miss Violet Loraine on a UNIBUS.

UNIBUS—the Ideal Runabout

TO see the UNIBUS is to want one.

One recognises in it the most useful solo machine that has yet been introduced to the public.

Car practice in design is followed throughout, and the UNIBUS runs without noise or vibration at any speed up to 25 m.p.h. over any road surface.

The rider is completely protected from oily engine parts and road splashing, so that there is no need to dress in motoring clothes — you *cannot* get muddy.

Mile after mile you may drive as comfortably and free from driving strain as in a very good car.

For long or short journeys the UNIBUS fulfils its purpose so completely that doctors and others find it indispensable.

You need a UNIBUS — get to know all about this car on two wheels.

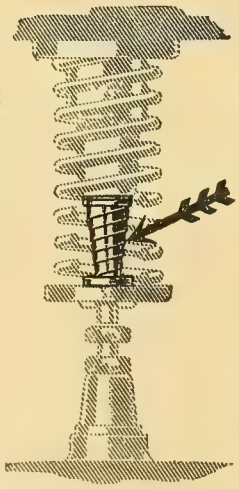
"FLEXEKAS"

Patent Applied for Regd.

"My brother is riding a 1919 2¾ h.p. Douglas, to which he has lat ly fitted a set of FLEXEKAS The im] rovement in the running of the machine is really remarkable she will start in her own length in top gear and can be thrott'ed down to six or seven miles per hour, still on high gear. We have not yet tes'ed the petrol consumption fully, but there is an improvement in this also. Perhaps the biggest differ-ence in running is the quietness of the entire valve mech-anism. I enclose 10/- postal ord r for a set of FLEXEKAS for my own machine."



An airtight flexible spring casing enclosing the valve stem and filled with special heat-proof graphite paste

2/6
EACH.

A notable advance in engine design which shou'd be fitted to all motor cycles old and new.

ECONOMY, EASY STARTING & SLOW RUNNING.

Prevents your valve guides wearing, stops air leaks absolutely, and permanently quietens valve clatter, and enables you to obtain perfect carburation in each cylinder.

No packing need. Nothing to wear out. Refill with "Flexekas" Paste (carton 1s. 6d.) when you overhaul—this is all the attention necessary.

State make and year of machine

Obtainable through Garage, or direct from the Patentee & Sole Manufacturer:

SEASON 1921.

THE "DEFY-ALL"

STARTLING BUT TRUE! GOOD NEWS AT LAST!

READ THIS ASTONISHING DECLARATION!

HE TRUTH, THE WHOLE TRUTH, AND NOTHING BUT THE TRUTH.

WE wish to draw the attention of the riding public to the fact that we have at last accomplished what has been the designer's greatest problem, namely, a OTOR CYCLE SPRING FORK AND SPRING FRAME ssessing freedom of movement in the vertical direction, the same time eliminating all possibilities of lateral play d providing absolute freedom from vibration, thereby suring perfect steering at all speeds.

It will be remembered that Mr. Caddick was, at the time of the last Olympia ow, connected with the Royal Ruby Cycle and Motor Cycle Co., and on the Daily Mail" expert examination of some of the design and craftsmanship, report was that they were "Monuments of Technical Skill, combined th the knowledge of what the user wants, etc."

Immediately after the Show, Mr. Caddick severed his connection with that pany and commenced business on his own account, since which time his ile brains have not been idle.

Mr. Caddick, being the inventor of many unique Motor Cycle and Sidecar ing suspensions and other devices, and having had over thirty years of prac- l experience in the Cycle and Motor Cycle Trade in general, has at last duced what he believes to be the ideal device for springing a Motor Cycle and aft.

He is of the firm belief that, unless a Motor Cycle is designed which will stand the condition of the roads, and also relieve the rider and the whole he machine from vibration and shocks, the Motor Cycle will undoubtedly tually lose its popularity. This he believes to be one of the main causes of present condition of the trade in general.

After long experiments, trials, and research, he is convinced that it is not necessary to spring the RIDER, but the WHOLE OF THE MOTOR LE; and also its springing abilities must be unlimited, without any of those ctionable rebound shocks which are visible in most types of springing arrange- ts. Above all things there must be NO SIDE-PLAY.

To obviate this, inventors have had their hardest task, and numerous attempts proved unsuccessful, with great loss of time and expense.

Many of the so-called Spring Frames on the market to-day, and which are how at the Olympia, will be found wanting, inasmuch that in—

No. 1 Model, the RIDER will be sprung, but not the POWER UNIT.

No. 2 Model will go one better, and spring the RIDER and the POWER UNIT, but not the CARRIER.

No. 3 Model, being the APEX of ambition, goes "NAP," and springs the RIDER, the POWER UNIT, and the CARRIER; but this luxurious model is so extremely expensive that it is only found in the sphere of the HEAVY-WEIGHT machine.

Still, the "NAP" machine is wanting in several characteristics—

1.—The objection to so many working parts, which are likely to cause trouble and provide a constant need for special attention.

2.—If anything happens to their springs or couplings thereof, the machine is rendered unrideable.

This has proved itself to be the main cause of prejudice and fear amongst riding public with regard to spring frames.

All these difficulties and objections have been successfully removed in the "DEFY-ALL" 1921 LIGHTWEIGHT SPRING FRAME MOTOR CYCLE, which will be on view at the Hyde Park Hotel, Knightsbridge, London, S.W.1, from Monday, November 29th, to Saturday, December 4th, for exhibition and trial purposes. All competitors and critics are specially invited, who will be allowed to have a trial run on the machine, which will convince them of the genuineness of our claim.

In the "DEFY-ALL" Spring Frame Motor Cycles there will be found many improvements—

1.—The absence of many working parts.

2.—The frame is relieved from all strains, the load being entirely balanced or taken upon the centre of a semi-elliptical spring, the said spring being able to move freely throughout its entire length, and has no rigid points.

3.—The device for instantaneously transforming the SPRING FRAME into a SOUND AND PERFECTLY RIGID FRAME.

4.—The adjustment of the front driving chain (from the gear box to the main driving-shaft).

5.—Quick-detachable footrests or footboards.

6.—Quick-detachable mudguards and carrier.

7.—Rear spring-up stand, with improved locking device.

8.—Improved methods of securing the tank.

9.—Duplex frame throughout.

10.—The machines will also be fitted with our latest Double-action Spring Fork.

Some special features of this unique Spring Fork are as follows:

1.—A centrally disposed spring, which is compressed automatically at both ends simultaneously; the load being entirely balanced upon a rocking lever attached to one end of the spring, ensures perfect steering at all speeds.

2.—A novel device in which the spindles are prevented from turning and the nuts from working loose; the latter are capable of being adjusted to the extent of 1-156th part of an inch.

3.—The fact of the spindles being locked ensures perfect bearing and lubrication to all working parts.

4.—Simplicity of design, which lends itself to the fitting of the brake and mudguard.

5.—The absence of plain and spring washers for taking up side-play.

This machine will be one of our 1921 models, and will be the first to take its place on the road.

We are also busy with our MEDIUM-WEIGHT and HEAVY-WEIGHT Models, but it will be some time before we shall be able to place these on the market.

In consequence of the large demand for these machines, the Company are considering the question of an increase in their capital, to assist them to execute their orders.

Further particulars will be given on application.

Agencies and contracts are now being fixed up, and applications should be made speedily. All orders will be executed in rotation and booked at current prices.

Price will be given as soon as possible.

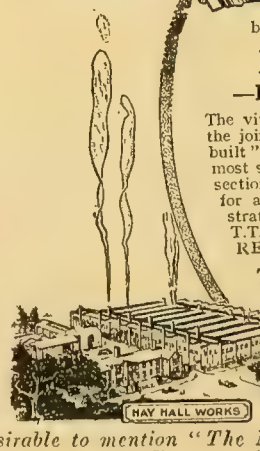
Rigidity

—that essential element in the construction of the successful motor cycle—is materially assisted by the building of the frame with the famous

REYNOLDS'
—BUTTED TUBES.—

The vital parts are their chief concern, and the joints of a "REYNOLDS'-Butted-Tube-built" machine frame are its strongest and most scientifically-designed parts—note the sectional illustration. And that they make for all-round efficiency is clearly demonstrated by the winning of the 1920 Senior T.T. Race on a machine built with RENOYLDS' Butted Tubes.

The Patent Butted Co., Ltd., Hay Hall Wks, Tyseley, B'HAM.



OUR OWN SHOW

Of New and Guaranteed Second-hand Machines is unequalled—remember all used machines are guaranteed for 3 months from date of purchase.

At Olympia, during Show Week, our representative will be in attendance daily, and we trust we shall have the pleasure of meeting all our old friends and making many new ones.

RE-CONSTRUCTED EX W.D. MACHINES.

BRICO
TRADE MARK
PISTON RINGS

These Piston Rings are manufactured on the most advanced principles known to-day. The experience of aircraft requirements during the war is embodied in both design and material.

We claim that BRICO Piston Rings are as near perfection as any piston ring in the world.

Even in appearance alone BRICO Piston Rings proclaim "quality," and a practical test of the rings in an engine will prove that their performance is equal to their appearance.

Perfect in finish, in fit, and in material, BRICO Piston Rings increase engine power and save lubricating oil.

BRICO Piston Rings are made for all popular motor car and motor cycle engines and are supplied from stock by return.

Traders should write for new Price List H. Private motorists are supplied by Garages and Dealers

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns —First 12 words 3/–, and 3d. for every additional word. Paragraphs of under 8 words are charged double rate. Each paragraph is charged separately. Name and address must be counted. Series discounts, conditions, and special terms to regular trade advertisers will be quoted on application.

Postal Orders and Cheques sent in payment for advertisements should be made payable to ILIFFE & SONS Ltd., and crossed & Co. Treasury Notes, being untraceable if lost in transit, should not be sent as remittances.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," 20, Tudor Street, London, E.C.4, or 19, Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue on which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge, which must include the words Box 000, c/o "The Motor Cycle." Only the number will appear in the advertisement. All replies should be addressed No. 000, c/o "Motor Cycle," 20, Tudor Street, E.C.4. *Replies to Box Number advertisements containing remittances should be sent by registered post, but in all such cases it is advisable to make use of the Deposit System.*

In the case of motor cycles offered for sale under a box number, as it is unusual for these to be sold without first being inspected by the intending purchaser, advertisers will facilitate business by embodying in their advertisements the mention of the district in which the machine offered may be seen and tried.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt. The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but, if not, we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions up to £10, a deposit fee of 1/- is charged; on transactions over £10 and under £50, the fee is 2/6; over £50 and under £75, 5/-; over £75 and under £100, 7/6; and on all transactions over £100, ½ %. All deposit matters are dealt with at 20, Tudor Street, London, E.C.4, and cheques and money orders should be made payable to Iliffe & Sons Limited. The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the case as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

ELECTRIC LIGHTING

AT THE PRICE OF ACETYLENE

THE "GODFREY" LIGHTING SYSTEM

"One of the most attractive and well-made Electric Sets we have ever handled."—"Motor Cycling" Nov. 3rd, 1920.

This Set, which is of an extremely practical design embodying several novel features, is recommended for its lighting efficiency, consistent with its extraordinarily low price. The complete Combination Set including three lamps, accumulator, box, armoured cable, and bulbs, can be purchased at practically the cost of an Acetylene Lighting Set. All the lamps are spun from sheet brass, finished black nickel, and fitted with a novel self-contained switch to each lamp; the set can be easily wired by the novice. All the lamps are fitted with bayonet bulb holders, while the lamp holder complete screws out of the rear lamp without disconnecting the lead or disturbing any fittings, and can then be used as an inspection lamp.

PRICES:

6 volt 40 amp. Set, with three Lamps, Accumulator and Box, Wiring, etc. - - **£8 10 0**

4 volt 40 amp. Set, with three Lamps, Accumulator and Box, Wiring, etc. - - **£7 14 0**

4 volt 20 amp. Solo Set, with Head and Tail Lamps, Accumulator and Metal Carrying Case, Wiring, etc. **£5 12 0**

MOTOR CYCLES FOR SALE.

Clyno.

1920 2¼h.p. Clyno Motor Cycle, new; £75.—King and Harper, 6 and 7, Bridge St., Cambridge. [8937

1920 8h.p. Clyno Standard Combination, new; £250.—King and Harper, 6 and 7, Bridge St., Cambridge. [8938

CLYNO Lightweights and Combinations.—Write Rothwell and Milbourne, Cowleigh Garage, Malvern. [1795

CLYNO 6h.p., countershaft, accessories, perfect; offers.—Mitchell, 44, Wellington St., Camden Town, N.W. [9017

STANDARD 1921 Clyno Combination, delivery from stock; £250.—Maudes' Motor Mart, 100, Paris St., Exeter. [8977

DAN GUY, Weymouth.—Sole district agent for Clyno motor cycles; new 8h.p. combination, £250; 2-strokes, £75. [5960

CLYNO Combination, 5-6h.p., spare wheel, lamps, etc., good as new; what offers?—Owner, 122, Gloucester Rd., Walthamstow. [7297

CLYNO New 8h.p. spring-frame Combination, electric lamps, etc.; best offer over £220.—Geo. Taylor, 28, Lower Addiscombe Rd., East Croydon. [8166

6h.p. Clyno C.B. Combination, 2-speed, K.S., any trial; £65, or offer, or lightweight and cash.—Bennett, 6, Alfred Place, High St., Battersea, S.W. [8827

1920 Clyno 2-strokes, brand new, at price which will quickly clear them. Secure one while they last by writing at once.—Alexander and Co., 115, Lothian Rd., Edinburgh. [8760

1918 Clyno 6h.p., Easting, spare wheel, lamps, horn, many spares, tyres almost new, a complete outfit in perfect order for £117/10.—Dunn, 326, Euston Rd., London. [7701

CLYNO.—We are sole Wolverhampton agents; write us for delivery dates, repairs, overhauls, re enamelling, and plating.—The Molineux Garage Co., Ltd., Wolverhampton. Tel.: 1160. [3459

CLYNO Lightweights! Reduced prices! Brand new, shop-soiled 1920 models. Buy now and secure a very special bargain.—Full particulars from Alexander and Co., 115, Lothian Rd., Edinburgh. [8759

5-6h.p. 1916-17 Clynos, less mag. and carburetter, £40 each. These require overhauling and renovating. They are worth £120 when finished. The engines and gear boxes are quite sound. See advert. under "Miscellaneous" for spares. 1916-17 3-speed K.S. Clyno W.D. Models, recondition, new Thomson-Bennett mag. and carburetter, running order, £65 each.—Please write or call, J. J. Dooley, 33, Killyon Rd., Clapham, S.W.8. [8867

Connaught.

1920 Connaught 2-stroke, as new, delivered Aug.; £52/10; exchanges or easy payments.—2, Nightingale Rd., Lower Clapton, N.E. [9337

CONNAUGHT Motor Cycles.—2½h.p. 2-speed model, £70; single speed, £62; immediate delivery.—P. J. Evans, 83-91, John Bright St., Birmingham. [0252

1920 Connaught, 2-speed, kick start, H.C. clutch, speedometer, mirror, mileage 720, new condition; £80, or offers.—Topham, Decorator, Bridlington. [8958

Coulson.

COULSON-BLACKBURNE 2¾h.p., 2-speed, new condition; any examination; bargain, £70.—22, Powney Rd., Maidenhead. [9282

COULSON B.—All models in stock; sole agents for Wiltshire.—Wessex Motors, Ltd., incorporated with H. P. Moore and Sons, Salisbury. 'Phone: 72. [4053

COULSON-B, 4h.p. and 2¾h.p. models, shop-soiled; at greatly reduced prices; now is the time to buy.—Mebes, 154-156, Gt. Portland St., W.1. 'Phone: 3426 Mayfair. [7182

COULSON B, 2¾h.p., 1920, very fast, and in splendid condition, complete with lamps, horn, etc., mileage 500; £85.—Apply, W. Sparrow, Ltd., Osborne Garage, Yeovil. [8861

NEW Coulson B, 2¾h.p., £99/15; fitted with 2-speed gear, spring frame, Blackburne engine; 2¾h.p. model, with clutch and kick starter, £110/5; 4h.p., with 3-speed, clutch, and kick starter, etc., 118 gns.; if fitted with smart boat-shaped sidecar, painted royal blue, £162/10, or on deferred payments 4% extra, only one-fifth deposit, balance by 12 monthly instalments. Harrods, Ltd., 118, Brompton Rd., London. [9027

Coventry Eagle.

1920 (Aug.) Coventry Eagle, 2¾h.p. J.A.P., Sturmey Archer 2-speed, kick start, little used, as new; £80. Clipson, Rushden, Northants. [8625

De Luxe.

DE LUXE 1920 (July) 2¾h.p., 2-stroke, 2-speed, E.I.C., scarcely used; £53. Treasure, Stoke, Oakhill, Bath. [X6743

Dot.

DOT-J.A.P. 6h.p., Maben clutch, hand starter, tyres perfect, bullnose back sidecar and chassis, nearly new; £65; North London.—Box 9,340, c/o *The Motor Cycle*. [9354

Our competitors are advertising SHOP-SOILED goods. There is no need for us to imitate. Our reputation guarantees that prospective customers will get the RIGHT GOODS at the RIGHT PRICE.

WE CAN OFFER THE FOLLOWING:

1921 4 h.p. **DOUGLAS** Combination.
1921 2¾ h.p. **DOUGLAS,** with clutch and kick starter.
1921 2¾ h.p. **DOUGLAS,** without clutch and kick starter.
1921 8 h.p. **MATCHLESS** Combination.
1920 2¾ h.p. **NEW IMPERIAL,** 2-speed.
1920 2¾ h.p. **NEW IMPERIAL,** with clutch and kick starter.
1920 3¾ h.p. **LEA-FRANCIS,** 2-sp., clutch, and kick starter.
1920 2-stroke **DIAMOND.**
1920 4¼ h.p. **B.S.A.,** 3 speed, clutch, and kick starter.
1920 6-7h.p. **B.S.A.,** 3-speed, clutch, and kick starter.
1920 3¾ h.p. Isle of Man **RUDGE.**
1920 8 h.p. **ZENITH,** sports model.
1920 5-6h.p. **A.J.S.** Combination.
1920 4 h.p. **TRIUMPH,** 3-speed, and starter
1920 2-stroke **TRIUMPH,** 2-speed.
1920 5-6h.p. **JAMES** Combination.
1920 6 h.p. **ENFIELD** Combination.
1920 8 h.p. **MATCHLESS** Combination.
1920 6 h.p. **NEW IMPERIAL** Combination.

MORGANS in stock at list price.

SECOND-HAND.

1916 2¾ h.p. **DOUGLAS,** 2-speed	£55
1915 4 h.p. **TRIUMPH,** 3-speed	£75
1915 4 h.p. **TRIUMPH** and accessories	£85
1920 2-stroke **JAMES,** 2-speed, and acces.	£70
1920 4 h.p. **DOUGLAS**-Combination and accessories	£155
1915 4 h.p. **TRIUMPH** and Sidecar	£105
1920 8 h.p. **MATCHLESS,** dynamo lighting and all accessories	£205
1919 8 h.p. **ZENITH,** sports model, with Sidecar and accessories	£135
1920 8 h.p. **NEW IMPERIAL** and Gloria Sidecar	£140
1915 **A.B.C.,** 4-speed, spring frame	£85
1915 Grand Prix **MORGAN**	£160

GOOD STOCK OF SIDECARS.

EASY PAYMENTS TAKEN ON ALL MACHINES, AND EXCHANGES ENTERTAINED.

1920 Olympia Prospects.

ON Monday next, November 29th, the doors of Olympia will once again be opened to admit the public to the world's most representative gathering of motor cycles. Indications would show that there will be a very large number of visitors, as usual, for interest was never so pronounced in the most economical form of motoring vehicle. There are perhaps a few who may wonder if there will be sufficient novelty to warrant a long journey to Town in view of the fact that some manufacturers frankly intend to retain their 1920 models. To these we would point out that there will be several novelties well worthy of attention, and that these departures will be of a much more practical nature than the sensational "freaks" which are usually brought out at Olympia and seldom see the light of day on subsequent occasions.

On the whole, the note struck by 1921 exhibits will be one of sound and steady progress, progress along already well-tried lines, and improvements brought about as a result of long experience on the road. There will be but few firms who do not include at least a few useful modifications in design, and there will be a sprinkling of more striking departures, which, however, have either been thoroughly tested, or are designed on commercial ines.

Apart from the exhibits, the Show will be well worth a visit from the social standpoint. As a meeting place for motor cyclists, Olympia is unique, and there will be many gatherings of ex-despatch riders, members of the Motor Machine Gun Corps, and other technical arms, in addition to club members who will meet to discuss the progress of the movement in general, and the new features of their favourite mounts.

In this issue of *The Motor Cycle* will be found many features which will assist our readers to see the Exhibition with a minimum of trouble. Our annual forecast has been divided into sections, one each for solo, dual purpose, purely sidecar machines, sidecar attachments, and runabouts, so that a prospective buyer need only use the section which interests him as a guide to the Show. In addition, a map and instructions for reaching the Show will be of value to those who are but ill-acquainted with London, while a *résumé* of the leading features of each exhibit is published. The chief novelties consist of a new four-cylinder motor cycle, a new cooling system applied to a flat twin, and a twin two-stroke three-wheeler.

Restrictions.

ELSEWHERE in this issue we are able to publish preliminary details of the new taxation scheme. These details are not likely to appeal to the average motor cyclist, and may possibly act as a hindrance to the already handicapped trade.

It will be noted that the certificate of payment must pass to the new owner on sale of the machine, thus the prospective purchaser at the Olympia Show will—unless he can dispose of his present mount before the New Year—be obliged to pay for two machines at the new and increased rate, in spite of the fact that he may possess only one machine at a time.

The fact that the certificate must be displayed in a conspicuous position is, perhaps, a lesser cause for complaint, and has obvious advantages from the official standpoint. Nevertheless, it implies the addition of an extra handle-bar fitting, which will not be welcomed by those who are fond of "clean" bars.

Again, many riders have for years retained a number-plate to which they have become attached, possibly because of the low numbers or appropriate initial letters.

There are still many points awaiting elucidation, and one is constrained to wonder whether the Department concerned has not left the matter a little late. No official statement has been announced yet, only five weeks remaining before the new regulations come into force.

An index to the advertisements in this issue will be found on the page facing the back cover.

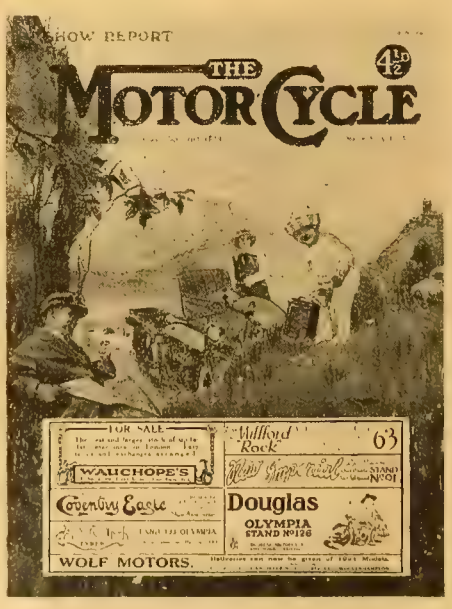
Occasional Comments by "Ixion"

Oil-cooling?

SOME months ago I ran into Granville Bradshaw, whose fertile brain was being tugged two ways. Apparently his tail lamp had dropped off its bracket, and been rolled out flat by a steam lorry; moreover, he had been charged some £2 for a new one. So one hemisphere of his brain was busy inventing a mass production tail lamp, which would merely dent the tyre or buckle the wheel of any motor lorry sufficiently misguided to run over it. The other hemisphere of his cerebellum was employed on a new engine, of which he did not display the drawings: but I gathered it was oil-cooled, and had the cylinders neatly concealed inside the crank case. In fact, my feeble brain conjured up a Heath Robinson nightmare of an overhead crankshaft. At the Car Show I ran into F. W. Barnes. "What's the latest Zenith stunt?" I inquired. He hinted that the latest Bradshaw engine *might* be seen on his stand, and that Emerson *might* be exploiting its track capacities before long.

A Loop Road Round London.

THE most amazing defect of our road system is the continuous failure of all road organisations to signpost a loop route completely encircling London. The ideal would, of course, be a special highway so distinctive that even a stranger would recognise it when he came to it. A cheap substitute, which is immediately possible at very small outlay, would be to signpost in some special way (*e.g.*, posts striped black and white) the existing loop roads which experienced suburbanites use when they drive, say, from Willesden to Kingston without crossing town. The loop roads already exist. A few metropolitan motorists know them all. But every year thousands of nervous car drivers and provincial motor cyclists flounder hopelessly in a maze of cross-roads in the effort to avoid such traffic vortices as Westminster Bridge and Trafalgar Square. Will the A.A. oblige? And if not, why not? Our contemporary, *The Autocar*, once published a useful map of these loops, but maps are unfortunately of little use to solo riders in this particular case—the net of roads is too close-meshed for driving by a map. Help in this direction would be specially valuable south of the Thames, for, to the average provincial, S.E. and S.W. comprise a vast *terre inconnue*.



A miniature reproduction of the coloured cover of our next week's issue, which will contain a full report of the Olympia Show.

An Autumn Ride.

COLD fingers certainly. A little blue-nosed, maybe. A certain restraint in corner work, thanks to the frequent patches of grease under the trees or where the road chanced to run sunless between high banks for a little way. But nevertheless quite the jolliest ride of the entire year. The foliage, instead of being a monotonous green, was splashed with every tint in nature's palette—quiet primrose, blazing orange, sedate russet, brilliant crimson, grey, brown, purple—what you will; maybe one tree with just a few palest yellow leaves still unfallen silhouetted against an evergreen cypress, so green that it was almost black: then a crazy chaos of orange, and green and mauve in giant splashes; then a tall, graceful leafless monster with silver bark clean cut against a lofty bank of vivid moss or fallen leaves, or fine needles. Just enough "bite" in the air to make you hungry and a country inn at the end of the run.

A Sidelight on Production Methods.

I AM bound to camouflage the facts which underlie this paragraph, but readers may take the figures as proportionately accurate. An inventor perfected a design of special interest to motor cyclists and got tenders for its manufacture from a British firm of the highest class—a firm which wanted work to keep a big plant busy. If he gave them the contract and allowed for a reasonable personal profit, the retail price would have come out at £75. It occured to him to get a tender from a French firm of equal standing. By giving them the contract and allowing himself the same percentage of profit, he could retail at £61 5s., of which sum over £15 was absorbed by import duty and cross-Channel transport. Under Free Trade the French article would have sold at less than £45, against £75 for the British article. This incident is eloquent of the difficulties under which export trade is now conducted. I do not imply that "ca canny" is by any means the sole factor; if any trades unionist likes to assert that "ca canny" has no responsibility for such contrasts, he will only strengthen the hands of those who teach that intensive production is needed to balance the handicaps from which our trade suffers (as it does, indeed, suffer at the present time) on the home as well as on the international markets.

The Best and the Worst.

A READER has compressed five years of motor cycling experience into a tabloid for my benefit, tersely naming the best and the worst sample of everything—'bus, engine, carburetter, lamps, etc.—and giving his reasons. The libel laws prevent my quoting his delightful impressions; perhaps I am further muzzled by the desire to be fair, as one man's meat is another man's poison, and our very best rough-rider (I name no names) implored me the other day to use no carburetter except that which my correspondent denounces. But an impromptu "best and worst" discussion would provide some fun for a club gathering on a winter evening, provided that any trade members were excluded, or, at least, handcuffed until the speakers had got a mile start on their several journeys homeward.

Flogging a Dead Horse?

'TIS an old saw which denounces flogging a dead horse; but I am going to talk waterproof gloves until I succeed in resurrecting them. I have scoured the earth for a satisfactory article, since the Continental rubber variety ceased to be procurable. At present I can only name the following successors:

1. Asbestol mitts. (Very warm. Don't get sodden under several hours' exposure to a real drencher. Too thick for delicate lever work.)

2. Archangel field force mitts. (Very warm. Waterproof. Too thick for delicate lever work.)

3. Dunhill proofed twill gloves, leather-faced. (These were specially made for me. Either the measurer or the cutter was at fault, as they are a bad fit. The firm stated that the proofed will won't stand much friction—hence the leather facings. The net result is waterproof, but too stiff.)

4. Beacon oil-skin mitts. (Strongly recommended by a correspondent. To my mind no mitt is nice unless you use a single lever carburetter.

The Cost of Electric Lighting Outfits.

DURING the past season I have heard many riders comment on the somewhat limited extent to which dynamo lighting outfits have adorned motor cycles up to date; in many cases they draw the conclusion that the reliability of these installations has been disappointing. Nothing could be further from the truth. I have personally covered a good mileage, and my sole difficulty was ascribable to an outside cause—accidental damage to an exposed cable. Three facts have militated against the popularity of these novelties. The first is a shortage of supplies, which will be remedied before another season opens. The other is more serious—their cost. A first-class acetylene set ranges in price from £5 to £10 according to size. An electric set has so far been charged at about £30 retail, if bought complete from its makers, or at about £24 if purchased through a motor cycle maker who allows for the magneto. The third handicap is the dislike which many riders evince for a rectangular battery case, awkwardly clipped in excrescent fashion on to the rear forks.

Some Considerations.

IN the new Maglita set the battery is carried in the rearward prongs of the lamp bracket, *à la* generator—a safe and convenient place, but no safer, no more convenient, and not so sightly as a platform on top of the gear box, where sufficient space can always be provided if designers are forewarned. The cost question will be solved. I have no experience of the Astra equipment, but it is advertised "complete from £12," which is getting down towards the price of a first-class high-powered acetylene set. The baby two-stroke edition of the new M-L installation is listed at seventeen guineas, from which the cost of an ordinary magneto must be deducted. So long as these sets cost appreciably more than a magneto plus a first-rate gas outfit, the ordinary rider will cling to acetylene, and manufacturers will hesitate to standardise an item which burdens their clients with unnecessary outlay. Ten pounds is about the figure (exclusive of the magneto) which would enable these installations to become universal. When that figure is reached, they will boom to an unprecedented extent.

THE LIGHTWEIGHT AT THE MEET.

Hunting has started in earnest, and at many meets the motor cycle has been in evidence. Here is shown a rider of a Junior Triumph enquiring of the huntsman where he is going to "draw."

WHAT THE SHOW WILL REVEAL

AN ADVANCE SUMMARY
of the Great Motor Cycle Exhibition which opens Next Monday.

THOSE who go to Olympia with the idea of finding a big change from present policies will have to look carefully if they are to discover much novelty. First impressions will undoubtedly produce the idea that there has been no change, but this impression will be only partly correct.

It is true that the majority of manufacturers will retain their existing models with but minor modifications, made during the past year; but there is an interesting undercurrent in existence at the present moment which will eventually steer motor cycle design into sound and progressive channels.

Specialisation.

The tendency towards the preparation of machines to meet specific requirements has already been noted in *The Motor Cycle*, and though it is no new thing as far as certain firms are concerned, it is beginning to affect the popular "$3\frac{1}{2}$." One of the first symptoms visible to the public appeared when Messrs. John Marston, Ltd., announced a light sporting model on the lines of their famous Tourist Trophy machine. Undoubtedly they will reap the benefit of their go-ahead policy, and the new model will form a centre of attraction for sporting solo riders. Messrs. Lea and Francis also are departing from their previous policy, in that they will stage a $3\frac{1}{2}$ h.p. three-speed solo machine on similar lines to the present two-speed model, and also an entirely new passenger machine with 5 h.p. M.A.G. engine and conventionally placed three speed gear. There are many others working on the same lines, including the Verus and Rex Co.'s, which next year will introduce "light" 4 h.p. models purely for solo use. Some other purely solo machines, with engines of 500 c.c., may not be ready for the Show. Many other examples might be given, including the N.U.T. and the new $3\frac{1}{2}$ h.p. Douglas.

This catering for specialised needs is all to the good, since a dual-purpose mount cannot possibly be either the best possible solo or the ideal sidecar machine, though its popularity is sufficient proof that it is admirably suited to its special purposes; indeed this should be so, since the type has received more attention than any other during the past few years.

Oddly enough, though the "$3\frac{1}{2}$" is likely to become a solo machine once more, many little two-strokes which up till now have been looked upon as purely solo mounts, are blossoming into sidecar machines with specially strengthened frame and sidecar chassis designed to suit.

Three-wheelers.

Amongst the three-wheelers, the Scott Sociable and the New Hudson will be new to the public, though both models, particularly the former, have been on the stocks for some time past. The Coventry Premier, modified in details only, has now attained its first birthday, and the Stanhope, front driven, has been on the road for several years, and to our knowledge has proved a remarkably tractable machine. The Castle-Three is a fully developed three-wheeler, with four-cylinder water-cooled engine and shaft drive and, like the T.B., which will also be exhibited, is only on level terms with the Premier so far as appearance is concerned.

Perhaps the best known three-wheeler in existence is the Morgan, which is noticeable for its simplicity as compared with latecomers to this market, which

What the Show will Reveal.—

tend towards over-elaboration rather than the production of the simple and inexpensive substitute for the sidecar. Several manufacturers of well-known sidecar outfits are experimenting with three-wheelers, which, however, will not be on view at Olympia, and it is to be hoped that these may be simplified to the utmost possible extent so that they may be sold at a price not in excess of their present productions. There is little noticeable change in engine design, and motor cycles have not yet followed the example of many post-war cars in adopting overhead valves and up-to-date design founded on war-time experience. The new 3½ h.p. Douglas, the 3½ h.p. Brough, and the Bradshaw-engined Zenith are exceptions, which will be on exhibition, though some of our most prominent manufacturers have experiments in hand.

Two Strokes.

The two-stroke design has improved to a certain extent, though this is not visible to the casual observer. There will be nevertheless the twin two-stroke of the Scott Sociable and the production model of the 500 c.c. single-cylinder Dunelt to attract the attention of two-stroke enthusiasts.

The flywheel-magneto Villiers is an interesting departure, since it offers an infinite range of spark advance, and thus overcomes one of the commonest two-stroke troubles, for the two-stroke requires a wider range than any other type, and yet, since the ordinary magneto runs at engine speed, it usually gets just half the range of a four-stroke engine.

The countershaft gear is now universal, but the Show will fail to reveal the use of lightweights fitted with suitable three-speed gears in any great quantities. Here the Levis and Velocette have made a bold attempt to get ahead of their competitors, and deserve to be congratulated for their perspicacity. The 2¾ h.p. Douglas has, of course, been fitted with a three-speed gear for the past year, but the Douglas firm have been pioneers in so many ways that one is apt to overlook their claims to priority.

Shaft drive seems to be as far away as ever, though the F.N., of course, will retain this feature. Those interested in shaft drive will find the transmission of the little Unibus worthy of examination. While not being motor cycles, but nevertheless driving to a single wheel, the T.B. and Castle-Three runabouts also will be of interest. Chain drive is forging ahead slowly, but there is no great change in this direction.

Equipment.

Larger tyres are on the increase, and it will be seen that saddle suspension has received much attention, but spring frames have not made the headway that might have been expected from the state of the roads.

Quite a few manufacturers will fit automatic carburetters at option, since during the past year several makes, notably the Claudel Hobson and the Cox Atmos, have given great satisfaction to the experimental staffs. Mechanical lubrication is slow in catching on, though Messrs. Lamplugh and Best and Lloyd have done their best to help in this direction. Here the American machines are undoubtedly ahead of us, and it is time that our designers woke up to the fact that nine out of ten riders do not know how much oil to give or when to give it, and would not wish to be bothered with the job even if they did.

The Real Lightweight.

There will be more complete electric equipments than ever before, especially since the M-L lightweight set is now an accomplished fact, and fulfils a much-needed end, as does the Lucas Magdyno.

In spite of the fact that, in 1921, a pound or two extra weight may mean an extra 30s. tax, there has been little attempt at weight reduction, but it seems probable that most lightweight manufacturers will be able to guarantee that their standard machines weigh not more than 200 lb. complete. Shall we see the real lightweight at the Show? Scooters, motorised push-cycles, and so-called lightweights, yes! but the real miniature motor cycle with two-speed gear weighing around 100 lb. has not yet appeared. There are such machines in the experimental stage, and every effort is being made to finish them in time for the Show. They are on the stocks, by now they may be on the road, but it is likely that those who go to Olympia to find them will be disappointed.

Those who have read so far will say they can see little that is new, and that, we fear, will be the verdict of many casual observers who go to Olympia. Nevertheless, there will be novelties, and no good motor cyclist should miss the great exhibition, for there is much to be learned from a comparison of machines, and there is an undercurrent of novelty which is the first symptom of a great change. Business and manufacturing difficulties have not encouraged departures from standard practice up till now, but when trade becomes more normal it will be found that the more progressive of our manufacturers will be ready to blossom out with something quite new to the public, though thoroughly tried out by themselves.

Novelties.

We know of a four-cylinder sidecar outfit that regularly does 100 m.p.g., and several new types of twin-engined machines, but the public will agree that little would be gained by exhibiting them when their production on a commercial basis cannot be organised for several months to come.

There *are* entirely new models, however. Among others the 4½ h.p. Ariel, the 3½ h.p. Douglas, the Bradshaw engine, and the 5 h.p. Lea-Francis are new throughout; the Enfield has a splendid new engine, built for them by Vickers; there will be at least one new four-cylinder machine—and a countershaft Rudge will be shown. And there will be new sidecars and accessories galore.

No motor cyclist who can afford the time should miss a visit to Olympia. There he will see that, although the innovations may not be startling, almost every exhibit will reveal sound commonsense progress in several directions.

Another trend indicating the commercial development of the motor cycle movement is shown by the number of sidecar taxicabs which will be exhibited. In these days of high prices this form of transport, which offers cheaper facilities, bids fair to become popular as soon as police regulations are satisfied.

BI·)

OFF THE BEATEN TRACK.

The A.J.S. on Bobbin Mill Hill. This stiff loose gradient leads from the lovely vale of Duddon, which lies between Coniston Old Man and Scawfell, climbing finally into the midst of the Langdale Pikes.

OVER *the* CUMBERLAND FELLS *with a* SIDECAR

BY GEO. D. ABRAHAM

A Lady's Exploits with a Sidecar on the Packhorse Tracks in Western Lakeland.

Author of "The Complete Mountaineer," "Motor Ways in Lakeland," "On Alpine Heights and British Crags," etc., etc.

THE war brought a considerable increase in the number of lady drivers, but nowadays they are seldom seen on the Lakeland secondary roads. True there are very few whom one would wish to accompany over these adventurous mountain heights, which add spice to the taste of touring. But the invitation was irresistible when Mrs. Riley, an expert competition rider, suggested a sporting run on her new A.J.S. outfit; for there were pleasant memories of her many feats on the Lakeland hills. Surely one might go anywhere with a driver who, for instance, had made the first lady driver's crossing of Hard Knott and Wrynose Passes from Eskdale to Langdale.

Thus there was a feeling of security as we set our faces southward from the northern metropolis of Lakeland, upwards over the char-à-banc-thwarted hill of Castlerigg, and down into the depths of Naddle Vale, with Helvellyn towering ahead, all golden purple and pink in full autumn vesture. We were bound for what is undoubtedly the finest long day's motor run in Lakeland, and, with the exception of a venturesome *détour* over a shoulder of bulky Black Combe, it is a very useful route for all motorists visiting the northern land of mountain and lake. On this account the details and principal features are well worth mentioning.

Thirlmere was seen at its best in glorious sunshine, after a summer wherein St. Swithin had extracted his full penalty of forty days' rain, and the forty-first day gave promise of a wonderful autumn, which was then being fulfilled. There was nothing to be seen of the ugly mudbank shore lines which last year resulted from Manchester's thirsty toll on the lofty lake. But the popular road on the eastern side of the dale had sadly deteriorated. Despite the remarkably efficient springing of the A.J.S. machine, interminable pot-holes spoiled the enjoyment of the scenery in comfort, and there were regrets that the curlier and longer way on the western shore had not been chosen, for it still retains an excellent surface. The long straights on the eastern side were strong evidence that speed soon tells on the best of roads. One wonders if in normal running a char-à-banc has ever been known to travel this section at the legal limit of twelve miles an hour.

A Jarring Note.

On high gear the sturdy machine carried its heavy load of three passengers and luggage speedily over Dunmail Raise and down into the pretty valley, where ugly sports erections still bore evidence of the *outside* world's invasion of "Grasmere's peaceful vale." On entering Ambleside the main trunk road was left by turning to the right and so through the foliaged hollows to Skelwith Bridge, with the Langdale Pikes looming ahead, ever beautiful in colour and contour. After crossing the Brathay, the twisting steeps of Oxenfell

Over the Cumberland Fells with a Sidecar.—

showed the normal climbing powers of the machine to perfection.

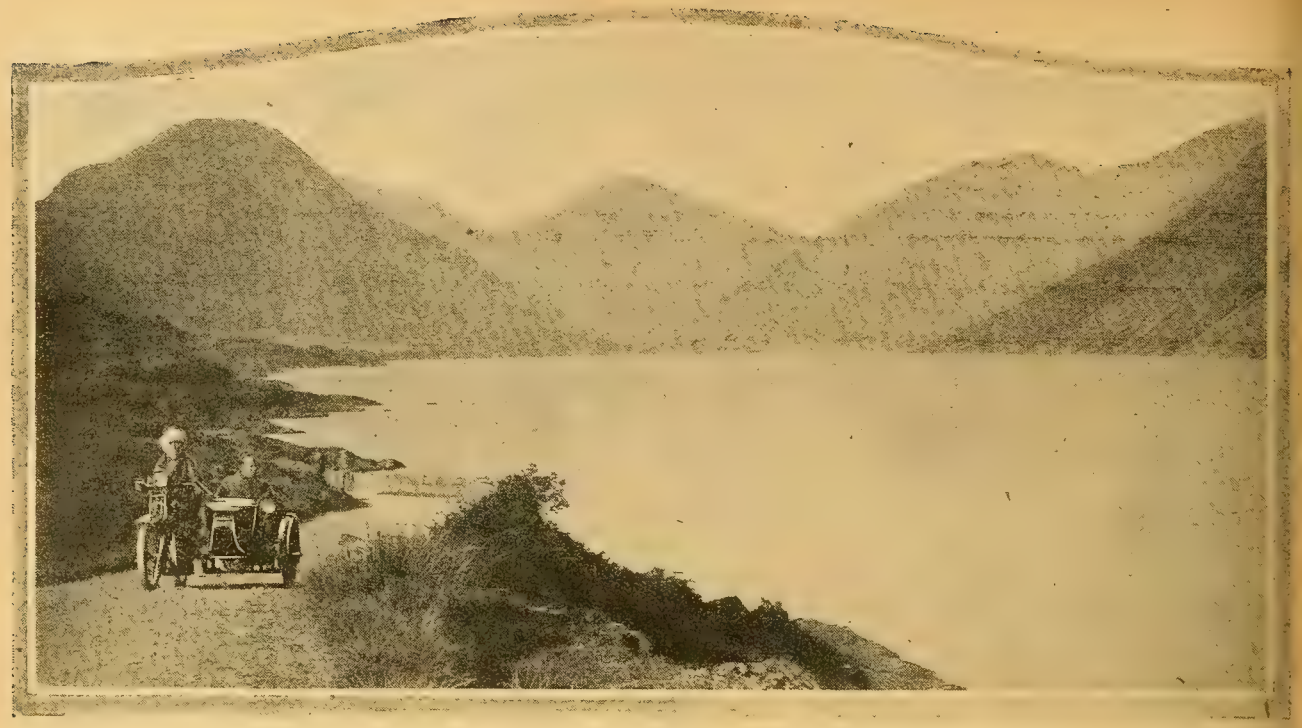
Soon we were speeding over the lofty wilds with distant views of Wrynose and its attendant rugged sentinels, whilst nearer at hand the road wandered onwards past rocky hollows 'midst a pageant of colour splendour, and through air strong with the scent of sunny heather. Down the brackened depths of Yewdale, with overhead glimpses through the larches of grim, grey precipices mantled in pervasive pinkness, we came under the shadow of the Old Man to the grey narrows of Coniston. Over its awkward bridge and round the sharp corners, where grey and white dwellings close-lined the roadway, the route lay distantly along the western shore of Coniston Water and on to Broughton-in-Furness. The main part of the town was missed by branching to the right, and so for a short time we followed the main west coast road to Duddon Bridge.

An Awkward Climb.

A sharp turn to the right now led into the pretty tree-clad hollows of Duddon Dale, and after negotiating the surprisingly awkward hairpins on Bank End Hill, where the three-speed gear box proved a friend in sudden need, we climbed over the slopes and swung down to the picturesque bridge over the Duddon at Ulpha. With a view to new hill discoveries for the next trials in Lakeland, the village of Ulpha was avoided by turning sharp to the left after crossing the bridge. Incidentally, it might be mentioned here that for those tourists who are making the round of the Lakes, the quickest way would be to run to the right beyond the Ulpha Bridge, and at the Traveller's Rest Inn turn up the steep hill on the left which leads to Birker Moor, and so over to Eskdale. The alternative ordinary route, which is considerably longer, would skirt round the southerly front of Black Combe, avoiding Millom by going from Hallthwaites to Whickham, where the main highway would be joined.

(Top) At the foot of Wastwater, where the road swerves out from the last of the trees to the wide open shore-line of Britain's deepest lake.

(Bottom) The A.J.S. in the shadow of the Screes by Wastwater. This is the most impressive of the Lakes, and the precipice on the further side, along which it is impossible to construct a road, plunges down 250 feet below the lake surface.



Another view of Wastwater, which conveys a good idea of the grandeur of the mountain scenery.

But the less-known mountain road over the high shoulder of Black Combe appealed irresistibly, and, turning south-west from Ulpha Bridge, there was a speedy dash at the tree-clad confronting heights. We jumped stirringly over a narrow, sharp, hog-backed bridge, to find ourselves suddenly "smacked in the face," as our eager driver pithily put it, by a regular cat's climb of a place. Instantly there was deft handling of the gears, and we were at grips with a long, stony gradient of 1 in 4. The ascent proved somewhat of a struggle, yet the heavy weight on the carrier prevented serious wheel slip, and ere long we were out amongst the heather and bracken revelling in a glorious prospect over Duddon Vale with the river curling far up into the southerly recesses of England's highest mountains.

The Summit of Black Combe.

A narrow "tricky" road now led steadily past lonely mountain farms that showed evidence of wild weather on these far-away heights; but now the sweet scent of hay was wafted in soft breezes from flowery pastures, wonderfully Alpine in effect and beauty. The road was excellent past Logan Beck, but surprising gates were frequent. One of these accentuated another excellent feature of the A.J.S. machine, for the front mudguard is arranged so far back that it was possible to slide into a gate and only the tyre took the impact. Fortunately, the aged gate was collapsible and readjustable. Then at the three road ends, one of which came up from the westerly side of Duddon Bridge, a signpost indicated a broad, grassy road leading to Whitehaven, and this carried us easily up a two-mile climb to the summit of Stoneside, 1,838ft. above sea level. Cloud-capped and gloomy, Black Combe justified its name. Then we swept swiftly over the crest, leaving behind the wild array of mountains, range beyond range, and gazing suddenly ahead over the open sea with rich tilth-lands underneath us lining the golden sands and afar off the peaked mass of the Isle of Man hanging apparently in mid-air.

From near this point, had time permitted, it would have been an easy walk to the top of Black Combe, which, from its peculiarly isolated situation, affords almost the finest viewpoint in the country. In really clear weather, England, Ireland, Scotland, and Wales may be seen. In fact, Wordsworth could scarcely be accused of poetical licence in his lines:

> "For from the summit of Black Combe (dread name,
> Derived from clouds and storms!) the amplest range
> Of unobstructed prospect may be seen
> That British ground commands."

Beyond the highest point on Stoneside the road divided—that to the right would have led more shortly to the main road near the foot of Eskdale, but after such a wet season boggy sections might have threatened engulfment, so the direct descent to the main road at Bootle was chosen. This was steep, grassy, and exciting, but one admired the beautiful soft, safe braking of the machine and the unusual comfort of the sidecar. A double hairpin in the lower section proved so entertaining that our plucky driver persisted in putting her skill and the A.J.S. against the difficulties of an ascent. It was a somewhat thrilling performance, and this Bootle Hill can be strongly recommended to those in search of adventure. Can it be climbed excepting under dry conditions?

A Feast of Colour Splendour.

Once on the main road it was a delightful run northwards over capital roads, with ever-changing glimpses towards the mountains and wide-views over seaward stretches; then, on past Eskdale until, beyond the glimpses of tree fringed Muncaster, the shapely heights

Over the Cumberland Fells with a Sidecar.—

of Wastdale appealed irresistibly. About three miles beyond the Muncaster Castle entrance a road on the right led up to Santon Bridge. Soon we were mounting upwards to scan that wonderful prospect over Wastdale, with the huge masses of the Screes bulking largely on the right, and in the centre Great Gable lording it finely amongst a host of giant peaks. Nearer at hand larchy hollows and grey, rocky foothills, fringed with heather and golden gorse, formed a magnificent feast of colour splendour in the rich autumn warmth of evening sunshine. This, and the sight of Wastwater—the most impressive of the Lakes, embosomed amongst England's grandest mountains—proved the unforgettable features of a remarkable day's outing.

Deep and Gloomy Waters.

The notable details of this remote Lakeland dale are the highest mountain, the deepest lake, and the smallest church. Time did not permit the run to be made up to Wastdale Head to see the quaint little sanctuary sheltering in the shadow of the eternal hills, but it was easy to realise the depth of the gloomy waters hid under the rugged precipices of the Screes, which plunge far downward below sea level. The height of the surface of the lake is 200ft. above the sea, and the depth is nearly 260ft.

The return journey from the shore near the foot of Wastwater, where the capital roads still bore evidence of the good work done by German prisoners during the war, was made by the high level route under the rugged scarp of Buckbarrow to Gosforth. Thence, after a speedy run to Calder Bridge, the useful divergence was made to Cold Fell, where a splendid road saved time as well as distance, and afforded more of the pleasures of the heights. After revelling in the sunset gleam over Ennerdale, with the rosy afterglow tinging the Pillar's rugged dome, the quickest homeward way lay by Lamplugh, Loweswater, Lorton, and the more familiar pass of Whinlatter. In gathering gloom we slid down into the vale of Derwentwater with pleasant memories of a day of perfection both of driver, machine, and ideal weather, such as this treacherous summer has seldom afforded.

The distance covered was just over a hundred miles, and, with the exception of the divergence from Duddon Dale over the shoulder of Black Combe, the roads were in excellent condition—in fact, much better than in pre-war days. There are few parts of the country of which the same can be said.

A Forecast of the New Taxation Scheme.

Licences to be carried in a Visible Position. Special Regulations regarding Sales.

IT is now possible to clear up a few points about which our readers are in doubt concerning the new taxation scheme. As has been previously announced, the following motor cycle taxes will be imposed: Motor bicycles up to 200 lb., 30s.; over 200 lb. and up to 8 cwt., £3; sidecars, £1; three-wheeled cycle cars under 8 cwt., £4. It is anticipated that these weights will be less fuel and oil, and loose accessories such as horns, lamps, speedometers, watches, clocks, and badges.

It is not likely that the authorities will insist upon every machine being weighed, but probably if a machine is suspected to be over weight the motor cyclist will be expected to bring proof that it weighs the amount claimed by him.

Many motor cyclists have been in doubt as to the future of the registration of the machine, and in this connection we are now able to announce that the registration fee is included in the licence fees, but in addition the motor cyclist will still have to pay the 5s. for his driving licence.

Log Books Required.

The registration must be with the registration authority of the district in which the motor cyclist resides, and he will have to fill up a declaration form. He will also have to carry a licence card in such a position on the machine that it is clearly visible from the near side. This card will be about 4in. × 3in., and must be carried in a waterproof case. This will enable the police to see without stopping the vehicle that the licence fee in respect of it has been paid.

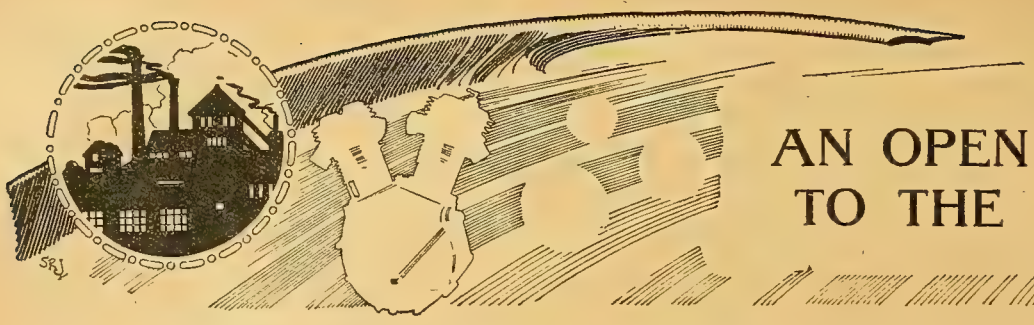
Every owner will also have a registration book, which will take the place of the copy of the entry of the registration he now possesses. This book will belong to the machine and will record its whole history. Therefore, in years to come, if the machine is still running, the book will give the particulars of each previous owner. Also, no machine may be sold without the registration book, and if an owner loses one it is likely to be a serious matter for him. He will have to satisfy the authorities that it was really lost, and will probaby have to pay to obtain another. The idea does not appear to be a very happy one. Many motor cyclists are, we are afraid, naturally careless, and it is reasonable to suppose that a good many of these books may be lost.

No Quarterly Licences.

One of the results of the new regulations will be that a motor cyclist may not retain his old number after this year. Previously, it may be remembered, he might, on selling his machine, cancel the registration and ask permission of the authorities to have this number transferred to his new mount. For the present, existing numbers may be retained, but they must be recorded by the local licensing authority.

The motor cyclist will not have the opportunity of taking out his licence quarterly or half-yearly, but it must be borne in mind that the licence belongs to the motor cycle, and if it is sold during the year, and a second-hand one is purchased on which the licence has been paid, no further expense is entailed.

It will be seen from the above outline that there will be a very great increase in the formalities with which the motor cyclist will be compelled to comply on January 1st next. No doubt these will prove irksome, especially until riders become accustomed to them, and it is not at all clear why all the new arrangements have been introduced. The log book idea is apparently an effort to frustrate motor thieves, who at present appear almost free to do as they wish.



AN OPEN LETTER TO THE TRADE.

Reviewing the Progress of the Industry since Last Year's Olympia Show. Prospects and Possibilities for 1921.

GENTLEMEN,—Once more it is my privilege to address an annual letter to you, and to congratulate you that we are now within nodding distance of business as usual, after four and a half years of war work, and two years of reconstruction and a motor cycle famine which inevitably accompanied your efforts to clear off the accumulated arrears. I don't know that I ought to say "business as usual," for you are having a trying time with "E.P.D."; those of you who have genuine sympathies with Labour (as I know most of you have), find yourselves between the devil and the deep sea as demand flows and ebbs: and our export prospects are certainly as streaky as a Cubist painting of a thunderstorm. Still, we are attaining a sort of equilibrium between supply and demand—not quite the equilibrium which we dreamt of during the nightmares of the war, but something better than the emergency manufacture of fuses, or the "kissing goes by favour" sort of delivery system into which you were driven last spring.

In the Matter of Prices.

With very few exceptions you have emerged most creditably from the maelstrom of the past few years. Most of you did all that could be expected in maintaining "service" for the users of your pre-war 'buses. I know there were a few shocking failures in this respect, but the public will give them cause for repentance, so we will try to forget. Most of all, I have to congratulate you, on behalf of all discerning motor cyclists, because you resisted the temptation to profiteer in the first half of 1920. Motor cyclists are like the crowd at a football match, who generally boo the referee when he gives a decision against the home team, even if their hefty full-back has handled a bantam wing man after the fashion of an elephant stepping on an egg-shell. So we, your customers, invariably grumble when you give a decision against us and put up your prices. But we are surely rather foolish: and we have all noted two things. One is that you have not put prices down again, as certain car firms have done: and we know you would if you could, for there will hardly be a fat living for all of you when demand has shrunk to normal dimensions. Secondly, however much we complain at your prices, we notice that they haven't gone up as much as clothes, boots, food, tobacco, and whisky. From which we gather that, if your figures sound rather steep, they are, nevertheless, commercially justifiable. You doubtless regret them as much as we do. Anyhow, we realise that your scutcheon bears no very indelible stain of profiteering, so here's to you! (By the way, what is a scutcheon?)

And so to technical matters. Some of you served in the Army, and you remember what happened at sick parade. You possibly had lumbago; your right-hand man had mumps; your left-hand man had scabies. But you all got a No. 9 pill. Which things are a parable. Thuswise. Jones is superintendent of a district for an industrial insurance company, and rides solo in all weathers. Brown is an undergraduate knut (pale mauve socks, shirt, tie, and, for all I know or care, pants as well). Robinson is an elderly grocer with a small wholesale business amongst rural chandlers: he drives a sidecar, filled from Monday to Saturday with grocery samples, and on Sunday by Mrs. Robinson. In the bad, pre-war days you supplied identically similar machines to all three users, except that you gave Brown a higher gear and a shorter, flatter kind of handle-bar. That is what I meant by reminding you of the dear old No. 9 pill. Silly, isn't it? So your standard 3½ h.p. was stiffened up to withstand poor old Robinson's bad driving, and geared down to haul Mrs. Robinson's ample, matronly 15 st. up Porlock on their summer tour: and it was rapidly becoming impossible to obtain a reasonably light and lively solo touring machine. "Thanks be," as they say in Ireland, No. 9 has made some of you think. The Sunbeam people are slashing lumps off their 3½ h.p. as if they were carving for a purple-faced alderman at the Lord Mayor's banquet; and I hear others are following suit. That extra tax on machines scaling over 200 lb. in 1921 may do a lot of good, eh? Or are you going to accept supertax on all touring machines, and confine the rebate to the babies? I fancy you'll get stung by some of the brightest brains in the industry if you should take that line.

The Case of the Spring Frame.

We can't blame you for the added discomforts of riding. You and we pay for the roads: but we neither designed them, nor made them, nor ruined them. What are you going to do about it, all the same? I know spring frames are not booming quite as much as we all expected. Too heavy, certainly. Too expensive, perhaps. But the real crab against them is that a super-fork with a super-saddle, and a pair of great big puddingy tyres affords about the same comfort at the same cost and without sacrificing simplicity. Of

An Open Letter to the Trade.—

course, we can't have full provision for comfort at a really low weight: and that is where different sections of the public are pulling you different ways. Here's a story to the point. A young man married into a family in which all the girls' hair turned grey at 28. People soon began to say he'd married her for her money. He said he wouldn't have complained if she'd had any money. I don't think many motor cyclists will complain of the weight of your machines provided they are really comfortable: but if they are neither—? For the immediate future give us the choice between a light, unsprung machine at less than 200 lb., and a heavy, pot-hole-defier, which may weigh almost anything you like so long as it doesn't give us concussion of the spine.

As a blindish sort of old gentleman with numerous evening engagements, let me say how I relish your new electric lighting systems. I now get home punctually without suffering from a fiery sensation at the back of the iris, and without having frequent fracas with pedestrians whom I have inadvertently rammed. These dynamos are very dear and rather heavy: but they are unquestionably the goods for the night rider, who hails them as his ancestors hailed the first high-tension magneto.

Fine Weather Finish.

You have probably noticed that machines are quite as awkward to clean as they used to be? It doesn't worry me. When I receive delivery, I apply a certain dope to the nickel plating for which you evince such an absurd fondness. It makes my plating look a thought sickly, but it keeps rust at bay. When I sell the 'bus, it takes me about eight hours with a sand-blast, a steam jet, a vacuum cleaner, a pick-axe, and a gallon of Brasso. My next door neighbour is eighteen years of age, and something of a dude. He spends at least twelve hours a week cleaning his 1920 machine. *Can't* you do something to shorten the process?

There are three motor vehicles for which you may hope to find a moderate assortment of spares in any sizable British town. I am sorry to say that the most universal supply fits an American car: I am proud to add that the other two supplies fit British motor cycles. "A stock of spares in every sizable town" is one interpretation of that much-abused term, "service." Another is to keep a businesslike man in charge of your replacement department in the Midlands. The latter is the standard usually accepted in the motor cycle industry. I fancy the time has come for an intermediate system. It costs a Westmorland rider several pounds to send his 'bus to Wolverhampton, and the process of obtaining a small spare by post is a four-day job. His lot might be transformed if there were a super-agent with a skilled mechanic and £100 worth of spares in Carlisle? I won't speak of overseas "service": you know what it is, so do I. We both know that it is the quality of the "service," quite as much as the quality of the 'bus, which gets the trade over the water.

The Efficient Front Brake—

There are a few lesser items in regard to which we eye you magnates of the trade with hope and trust. We have waited long enough for front brakes which are safe, usable, and powerful. One or two came along this year. Are they the van of a mighty host? There are tool-kits and tool-kits. At the Car Show the Standard people pinned their tool-kit up on a blackboard. You'd be surprised to know what interest it excited. Some motor cycle manufacturers could wisely copy the dodge: others would rather lie down in front of a lampless steam roller on a dark night. Some of you do your own motoring in Rolls-Royces: some of you on two wheels. The former class do not comprehend how much lumber the average motor cyclist carries with him on his jaunts. I have just catalogued my own odds and ends. One spare plug, two spare electric bulbs, three one-minute tyre levers, a tyre repair kit, half a dozen chain bits, a rivet punch, a tyre gaiter, some "concentric" electric wiring. Where do I stow them? Obviously the off side tool-bag, which has a c.c. equal to that of a half-pound cocoa tin, cannot accommodate the lot. They used to go inside my gas lamp until twilight: now they mostly reside in my pockets—ask the tailor what my bill for ironing and pressing my Mallaby-Deeley's was last quarter.

— And 1921.

Well, gentlemen, this mixed brew of bouquets and tirades is getting somewhat tedious. As you know, we riders bark a great deal more than we bite. We have not been through the mill of producing a motor cycle with shareholders all around us, Bob Williams spouting in the town on Sundays, and Austen Chamberlain sending his myrmidons round once a week to demand a few more millions of E.P.D. for the new war in Mesopotamia. So we are really heartily proud of you and of the 'buses with which you provide us. We wish ourselves a fine season in 1921 with a keenly fought T.T. and a less Colonial Six Days: and we wish you pleasant relations with Labour, a new Chancellor of the Exchequer, and a healthy recovery in all-round trade.—Yours very respectfully,

B. H. DAVIES.

"PHOTOGRAPHY MADE EASY."

THE motor cycle and the camera are almost complementary, especially to the man who rides for pleasure, so we need not apologise in calling our readers' attention to an excellent volume on the use of the latter. "Photography Made Easy*" is the title, and a perusal of this little volume convinces us that photography *is* easy—when one knows how.

Much of the pleasure of photography is missed when the services of the professional are utilised for the developing and printing processes; and these tasks, with a proper understanding of the subject, are interesting and easy. The volume provides this information in a simple, clear, and readable form (the chapter on lenses, for example), and in a manner that should be of much use to the expert. The author is R. Child Bayley, who is also editor of *The Amateur Photographer and Photography*.

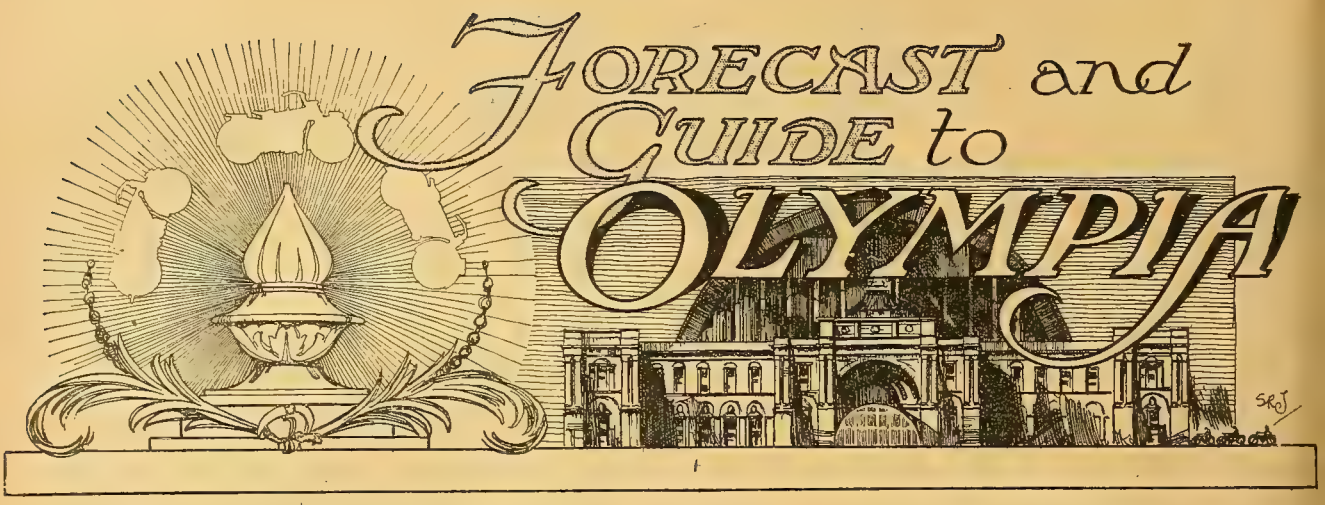
Forecast and Guide to Olympia



Exhibits at the Motor Cycle Show which opens on Monday next, arranged in sections grouping the several classes of machines.

I.—SOLO MOUNTS .. .. .. pages 620 to 622
II.—DUAL PURPOSE .. .. .. „ 622 to 626
III.—MACHINES FOR SIDECAR WORK „ 627 to 632
IV.—SIDECAR ATTACHMENTS .. pages 633 to 636
V.—RUNABOUTS .. .. .. „ 636 to 637

Section I.—SOLO MOUNTS.

In last week's special lightweight issue we gave particulars and illustrations of 55 lightweight motor cycles and miniatures which will be marketed in 1921, and which will be exhibited at Olympia next week. In order to make this section of our forecast complete, we give below a list of these solo motor cycles of the smaller type, together with the number of the stands upon which they will be staged.

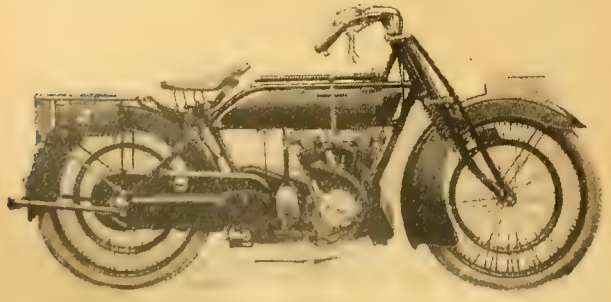
§ 350 c.c. four-strokes. ‖ Flat-twin. * Two-stroke. ‡ Four-stroke. † Miniatures

Stand **LEA-FRANCIS.**

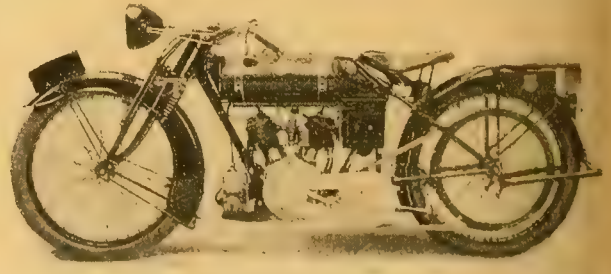
58. A 3½ h.p. M.A.G. engine forms the power unit of this well-known twin solo machine, and for 1921 a three-speed gear, in place of the two-speed hitherto used, will be included in the specification. It is a machine which stands almost alone, in a class known for its superfine finish and refinement in detail. Larger tyres than usual on solo machines are fitted, viz., 26×3in.



The 3½ h.p. Lea-Francis shares with three others the market existing for 500 c.c. V twin solo mounts. The engine is a M.A.G. with a cylinder capacity 496 c.c.

Stand **N.U.T.**

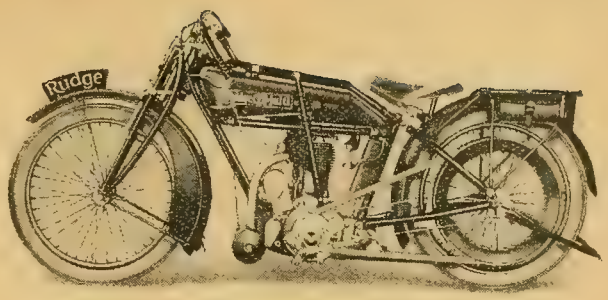
140. Although described fully in last week's issue we again illustrate the 3½ h.p. N.U.T. in order to make this section as complete as possible. Built purely for solo work, it is fully equipped for the road, and has a Magdyno lighting and ignition set as part of the standard equipment. A special T.T. model will also be shown which retains most of the standard features, but is fitted with an overhead six-valve engine and a plain magneto in place of the Magdyno.



Fully equipped with Magdyno lighting set and many other refinements, the N.U.T. 500 c.c. V twin last year set a new standard in solo machines.

Stand **RUDGE.**

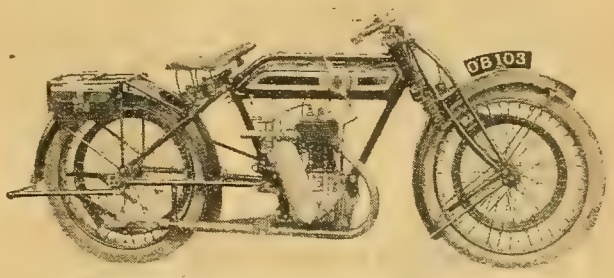
113. A type of machine for which there is always a steady if somewhat limited demand, the Rudge 3½ h.p. (85×88 mm. = 499 c.c.) Isle of Man models will attract the attention of those riders to whom the charm of infinitely variable gearing appeals. No more desirable type of solo mount can be imagined, especially when a clutch and starting device are incorporated in the design. The necessarily high bottom gear ratio and the all-belt drive demand reasonable handling if the machine is to be used in a mountainous district.



The success of the Rudge in the 1914 T.T., and the convenience of the multi gear, are responsible for its continued popularity as a solo mount.

Stand **ROVER.**

89. Although the majority of Rover models are of the utility or double-purpose variety, the makers nevertheless find that a certain market is always open for a machine stripped of all but its bare essentials. To fill this the sporting direct driven 3½ h.p. single-cylinder machine will be shown, and it should make an irresistible appeal to the man who wishes to shine in speed events, or who finds his joy in keeping a highly efficient engine in the very pink of tune.

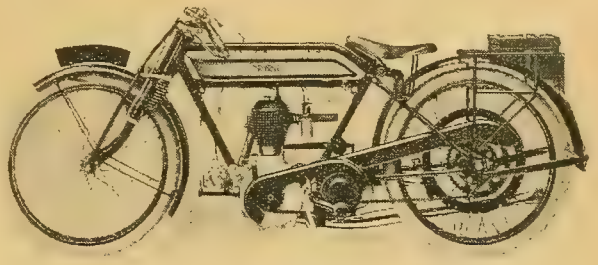


A simple solo single which the New Rover Cycle Co. will offer to sporting riders. Recently we observed it accomplish a speed of 75 m.p.h.

Stand **NORTON.**

71. The 3½ h.p. single-speed Norton may be regarded as the culmination of its type; it represents the best of a class which was predominant in the hey-day of the "singles," and it still makes its claim for popularity. It pioneered the long stroke movement, and its 79×100 mm. (490 c.c.) engine is an object lesson in clean and efficient design.

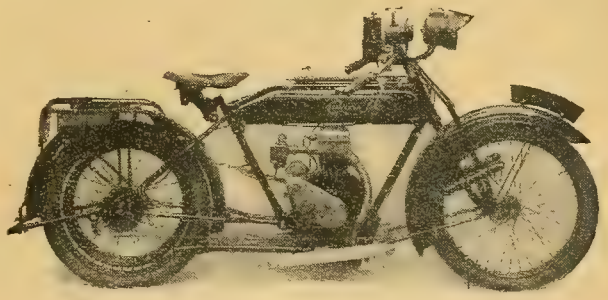
While the direct, belt-driven "3½" is nowadays regarded as a survival, no sweeter running and more flexible mount can be imagined, especially if the Philipson pulley is used. To the man who "travels light" and confines his week-end kit to a tooth-brush and a safety razor it makes a touring mount which teaches the joy of living.



A favourite with speedmen—the 3½ h.p Norton

Stand **CORONA.**

47. Simple engine construction with outside flywheel and mechanical lubrication are features of the Corona engine, which has been designed primarily for incorporation in a sporting solo layout. The 3½ h.p. engine is full of interest, and several innovations are embodied in the frame and forks; these are dealt with on another page.



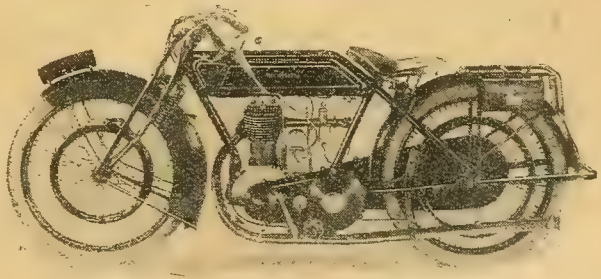
The crank case and part of the cylinder are integral in this new outside flywheel Corona.

Stand **SUNBEAM.**

129. A complaint frequently urged against modern machines of medium power is that they often tend to become unduly weighty in the maker's efforts to render them suitable for sidecar work. The result of this feeling no doubt has brought into being the 3½ h.p. sporting model Sunbeam, which has been based upon the general lines of the standard productions of the firm with certain detail modifications which make for weight reduction, such as the elimination of the kick-starter and the substitution of ordinary wheels for the quick detachable variety. Whether the makers succeed in persuading the public to refrain from attaching a sidecar is a moot point.

Stand **REX.**

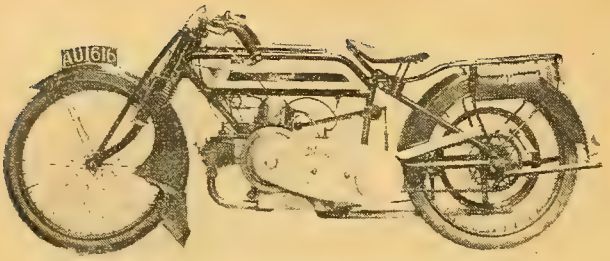
84. Hitherto the post-war products of the Rex Motor Co., Ltd., of Coventry, have been in the direction of sidecar outfits, but it has been felt that the old-established name (always associated with advanced designs) should be represented by a solo model; in consequence a lighter machine, of much shorter wheelbase than the standard, will be shown. It has a 4 h.p. Blackburne engine, three-speed Sturmey gear, and Brampton forks combined with many detail refinements, peculiar to Rex machines.



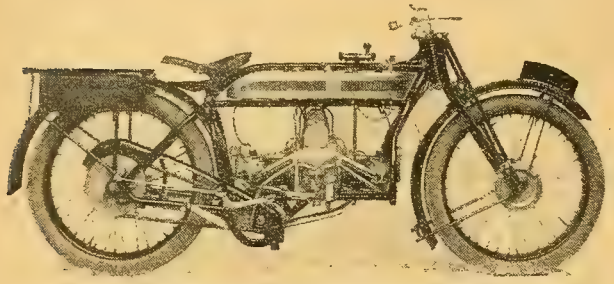
A new 3½ h.p. sporting Sunbeam—designed specially for solo work.

Stand **VERUS.**

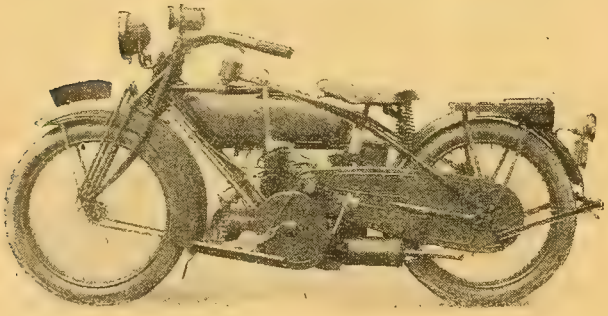
161. Designed purely for solo service two new models of the Verus will make a strong appeal to visitors to Olympia. The light sporting frame and a Sturmey-Archer three-speed gear box are common to both machines, one of which has a 4 h.p. Blackburne engine, and the other a 2¾ h.p. power unit of the same make. It is interesting to know that the latter scales but 195 lb., and will therefore be subjected to the 30s. tax.



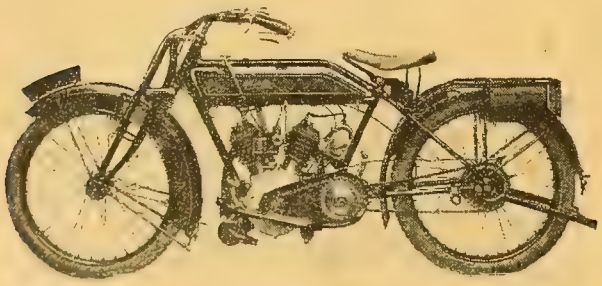
A solo flat twin with overhead valves—the 3½ h.p. Brough.



The first all-chain-driven Douglas is the new sports model "3½," which has overhead valves.



A mount originally designed to conform to the requirements of solo riders in America—the flat twin Harley-Davidson.



3½ h.p. James V twin solo machine—a light and therefore handy mount with plenty of power.

Stand **ZENITH.**

87. Although of recent years Zeniths have had big twin power units, they have been very popular solo mounts; but it was only last year that a machine below 500 c.c. was marketed. It embodies a soundly designed flat twin engine of 58.75×65 mm. (347 c.c.), and, of course, the Gradua gear, which operates from a countershaft underneath the engine. Primary chain adjustment may be effected by a vertical movement of the countershaft without affecting final belt tension. By means of an ingenious link mechanism, rear braking efficiency is maintained when the rear wheel moves back to take up belt slack on the lower gear ratios. Combined with great accessibility and efficient mudguarding, this machine makes a wide appeal to potential riders.

Stand **BROUGH.**

64. Speed with comfort is the aim of the new sporting 3½ h.p. Brough. The product of eight years' experience with this type, its 496 c.c. overhead valved flat twin is primarily a high-speed engine; while an even torque and long wheelbase both contribute to smooth running and easy control. Noteworthy features of the design are (1) the lubrication of the valve rockers through the hollow operating rods, (2) the lubrication of the primary chain from the crank case release, (3) the detachable cylinder heads, and (4) the large internal expanding Ferodo-lined front brake built up with the hub. To the engineer, naturally, the inherent design is well worthy of note.

Stand **DOUGLAS.**

126. The new sporting model 3½ h.p. Douglas has everything in its favour for making a strong appeal to the "fast" solo man. The name and reputation of the company, past performances, an "efficiency" design, and the very lines of the machine all suggest speed, and we feel sure that the suggestion will be confirmed in the future. Detailed particulars appeared in our issue of October 28th. Briefly, the flat twin engine of 68×68 mm. (494 c.c.) is an entirely new design, possessing all those recognised efficiency points such as overhead valves, a nearly hemispherical combustion head, and a really complete system of mechanical lubrication. The drive is all chain, through a new three-speed gear box, with clutch and kick starter.

Stand **HARLEY-DAVIDSON.**

29. America, to the motor cyclist anyhow, is chiefly noted for its big twins. So the appearance in this country last year of a flat twin Harley-Davidson aroused considerable interest and curiosity. During the year the controllability and smooth running of this model have been amply demonstrated on the road, and 1921 will see little change in the general design. One camshaft operates each pair of staggered valves, in the 4 h.p. 70×76 mm. horizontally-opposed twin engine, where simplification in design has been undertaken to a much greater extent than is outwardly apparent. The final drive only is by chain, the primary drive being direct to the three-speed gear box.

Stand **JAMES.**

88. To classify exactly the 3½ h.p. twin James it is necessary to use boxing nomenclature and to call it a light-medium-weight. This exhibit will be all the more interesting on account of the fact that the type (a 500 c.c. V twin) is something of a rarity nowadays. Nevertheless, with a three-speed gear and all-chain drive, this James makes an exceedingly attractive little solo mount; and the temptation to add a sidecar is not too strong.

Section II.—DUAL-PURPOSE MOUNTS.

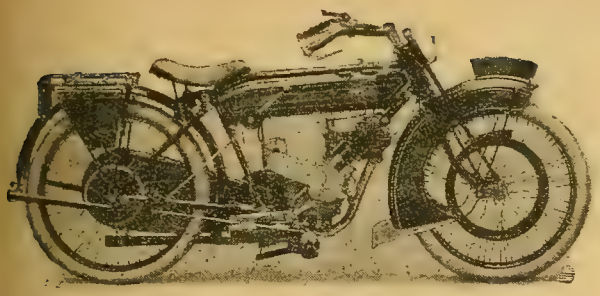
Stand **P. & M.**

74. The P. and M. is a machine which may be said to have been slowly evolved rather than one which has been altered drastically at any one time. It was a success almost twenty years ago, and it still retains most of its original features in a modified form. It is not surprising, therefore, that the P. and M. is renowned for its reliability, while its finish has always been of the best; it was these qualities which made it the choice of the R.A.F.

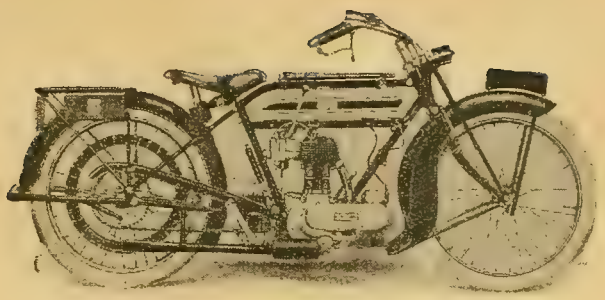
Having a bore and stroke of 84 mm. and 88.9 mm. respectively, the capacity of the cylinder is 498 c.c., which nowadays is regarded as being on the small size for serious sidecar work; nevertheless, the P. and M. is used for this service quite as much as without an attachment. It is distinctive in many ways; the engine is placed in an inclined position in the frame, and two speeds are provided, engagement being by expanding clutches operated by a lever on the side of the tank.

Stand **TRIUMPH.**

114. It is common knowledge among motor cyclists that nothing is ever standardised on a Triumph until it has had at least twelve months testing in the hands of various riders. The new chain-driven model may be said to be the net results



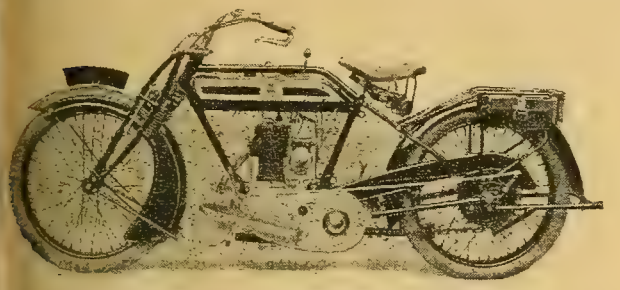
A two-speed gear machine which still retains its place in the front ranks of dual-purpose mounts—the P. & M.



The 1921 chain-driven Triumph embodies several innovations, including new type of fork suspension and improved front guard.

of several years' experimentation. It may be remembered that the nucleus of this model successfully accomplished the A.A. 5,000 mile benzole test, when an average consumption of 83 m.p.g. was obtained with a sidecar. 4 h.p. Triumphs of this type also emerged successfully from this year's Six Days Trial, when every one of the eight competitors riding them were awarded gold medals.

An improved design of front mudguard is now fitted. This is wider and deeper than usual, and is turned in at the sides, forming a channel which is continued through the front extension as far as the stays, where it is carried across the inside of the guard. By these means liquid mud is trapped and disposed of down the channel or *via* the front stays, which are of channel section, to the ground. The chain-cum-belt model, with Sturmey-Archer gear, is also fitted with this guard.



A single, noted for its silence; the 3½ h.p. Rover, which now has chain drive.

Stand **B.S.A.**

69. The 4¼ h.p. B.S.A. for 1921 is of a new design, and is fully dealt with elsewhere in this issue. A new pattern gear box is fitted, and other modifications include improved spring forks. Both chain and chain-cum-belt models are offered.

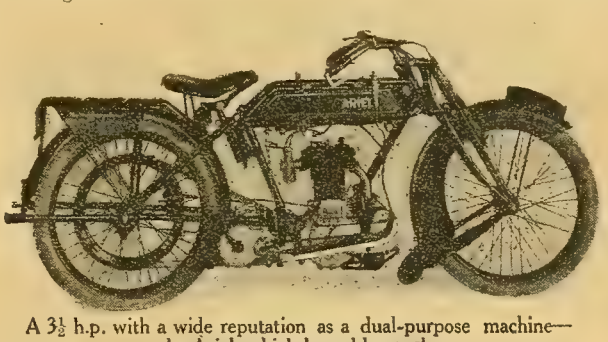
Stand **ROVER.**

89. Pre-war 500 c.c. machines used for both solo and sidecar are not very numerous, most of them having been enlarged by 50 c.c. and over. Nevertheless, this size of engine will probably be used during 1921 by a larger number of makers than ever. The Rover 3½, however, has always been regarded as being very suitable for the double purpose work, and among the "singles" is noted for its quiet running, and the fitting of all chain transmission has not robbed it of this commendable feature. Although more often classed as a sidecar machine, the 5-6 h.p. twin model, illustrated on page 627 is frequently used for solo purposes.

Stand **ARIEL.**

97. Larger wheel bearings and an improved spring fork are among the improvements embodied in the 3½ h.p. Ariel for 1921. We are pleased to note that this model is being retained in addition to the new 4½ h.p. single, described on page 656 and which is intended for passenger work. The Ariel 3½ has long been a favourite dual-purpose mount, and has perhaps a better record in reliability trials than any other machine of its size. Its success with a sidecar has been remarkable.

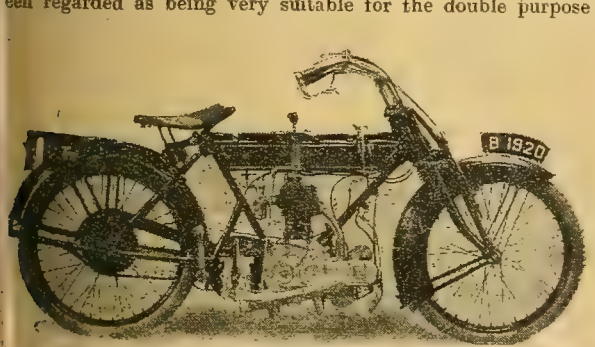
The engine is fitted with a decompressor to facilitate starting.



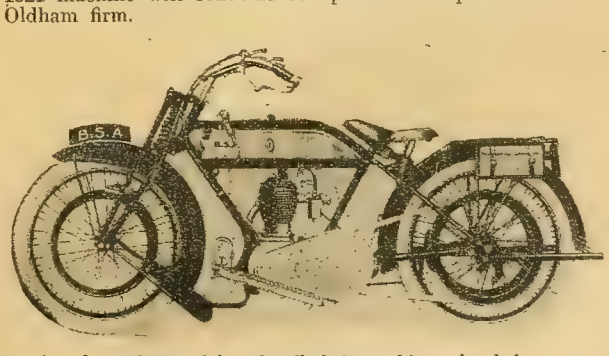
A 3½ h.p. with a wide reputation as a dual-purpose machine—the Ariel, which has a blue tank.

Stand **BRADBURY.**

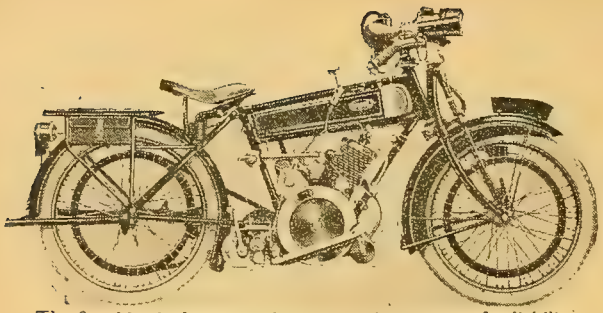
60. One of the first of the 4 h.p. singles, the Bradbury dual-purpose machine has several distinctive features. The method of fixing the engine is one of these, the periphery of the crank case being part of the frame. Its bore and stroke are both 89 mm. (554 c.c.), and the transmission is by chains through a three-speed gear box with cork-insert clutch. For many years this model, in its various forms, has held a front rank position, and there is every reason to believe that the 1921 machine will continue to uphold the reputation of the Oldham firm.



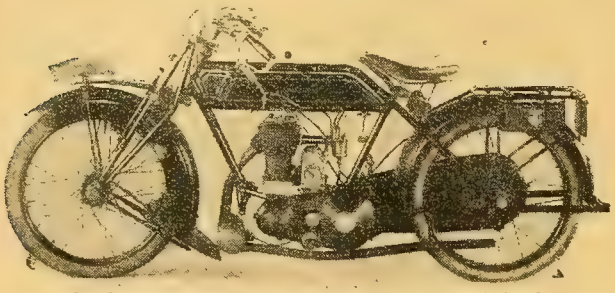
The big single Bradbury. Observe the method of carrying the engine in the frame.



An alternative model to the all-chain machine—the chain-cum-belt 4¼ h.p. B.S.A.



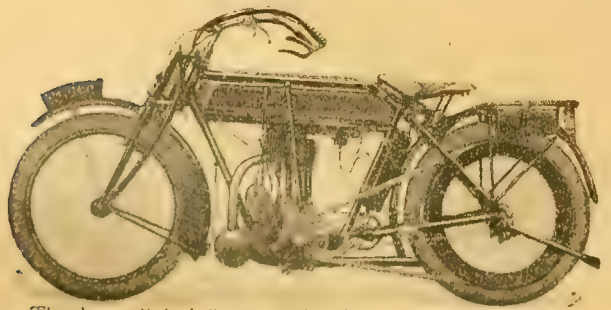
The first big single two-stroke to prove its power and reliability in a Six Days Trial—the 4½ h.p. Dunelt



On the dual-purpose Sunbeam the chain transmission is enclosed in an oil bath case.

The 4 h.p. Norton—a popular dual-purpose machine which, besides being suitable for solo use, makes one of the fastest of sidecar mounts.

Although designed as a solo mount, this year the Indian Scout will also be exhibited as a sidecar outfit.



The largest "single" now made—the dual-purpose 5-6 h.p. Rudge Multi.

Stand **DUNELT.**

138. Of recent years there has been a tendency to increase the size of the air-cooled two-stroke; but only one firm (Dunford and Elliott, Ltd.) has gone so far as to market a 500 c.c. single of this type. Its design has now had a considerable amount of severe testing and has proved very satisfactory. Naturally, the initial cost of such a machine (solo or sidecar) is going to be considerably less than an equally powerful four-stroke.

Stand **SUNBEAM.**

129. One of the higher priced medium-weight sidecar outfits, the 3½ h.p. Sunbeam, has proved itself a proportionately high performance machine both in private ownership and open competition. Little alteration to the luxurious specification will be noticed, but the makers recently introduced a sidecar suitable for use with this machine, which will no doubt attract much attention on account of the well-known excellence of Sunbeam productions.

Stand **INDIAN.**

100. Primarily intended as a solo machine, the power and strength of the Indian Scout make it very well suited for sidecar work with an attachment of the "sporting" type. The speedy lines of the machine are not belied by actual performances. 26 × 3in. tyres, in addition to giving an appearance of solidity, are responsible for greatly enhanced riding comfort.

Stand **RUDGE.**

113. Many sidecarists still prefer a hefty single to a large twin, and to such the 5-6 h.p. Rudge should make a distinct appeal. It is one of the few surviving big singles with direct belt drive, and in conjunction with the compulsorily high range of gear ratio given by the Multi gear, it often calls for skilful driving in difficult country. However, the power is there, and also the simplicity—two very important points.

Stand **NORTON.**

71. All fields of competition work have been grist to the mill of the Norton, but the speed successes of the T.T. and Brooklands machines have tended to obscure the reliability performances of the Big Four. As these latter successes are not isolated examples, and as the very term "Big Four" is claimed to have originated here, this model actually attracts as wide a *clientèle* as the popular solo machines. The long stroke of the engine is, perhaps, the most interesting feature. The bore and stroke are 82 mm. and 120 mm. respectively, and the capacity 633 c.c.

Stand **BROUGH.**

64. The 5-6 h.p. Brough is one of the small group of flat twins which are capable of serious sidecar work, and at the same time remain light and handy enough for pleasurable solo riding. The flat twin engine has a bore and stroke of 70 × 90 mm. (690 c.c.), and the machine generally follows the outlines of the 3½ h.p. model.

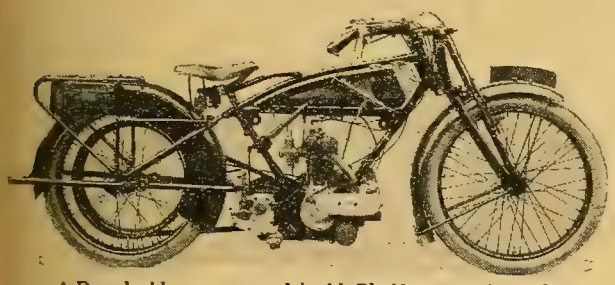
Stand **VERUS.**

161. An entirely new model in the 1921 Verus range is a sidecar outfit upon which the makers have spent a considerable amount of thought. It is engined with a 4 h.p. Blackburne engine, and the gear box a Sturmey-Archer—around these two main units a very taking machine. Exceptionally wide mudguards are fitted, and the outside flywheel is enclosed in an aluminium cover which forms part of the case for the primary chain. A large capacity saddle tank encloses the top tube of the frame, and is of a design which eliminates the massive appearance of some tanks of this type. The details are well carried out. For example, the front wheel stand is secured to the mudguard valance by means of side clips. Sidecar lugs are integral with the frame. 26×3in. tyres are fitted.

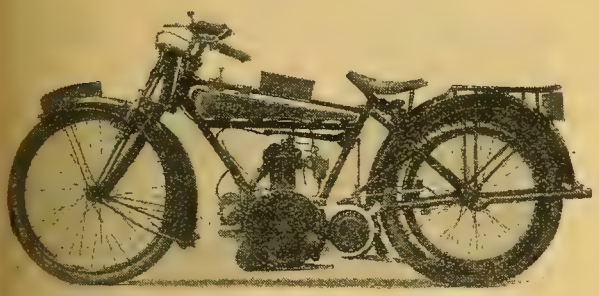
Stand **DALTON.**

15. Well tested features are adhered to in the 5.7 h.p. outfit made by the Dalton Motor Co., of Manchester; the engine is the Coventry Victor flat-twin, and transmission is by chain through a Sturmey-Archer gear box. It is a substantial looking machine with a low riding position, and a long wheelbase.

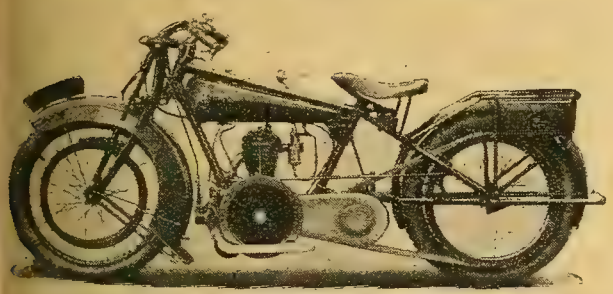
The 4 h.p. New Scale—a good-looking machine for solo and sidecar service



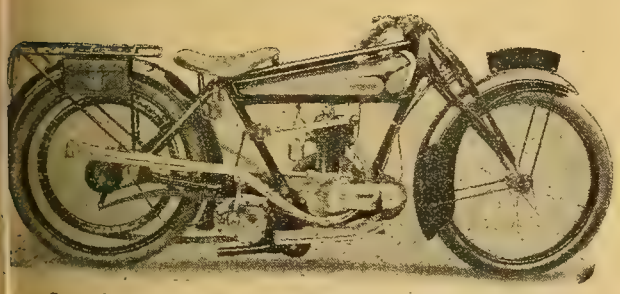
A Rex double-purpose model with Blackburne engine and Sturmey gear.



The Verus "4"—a big engine in a small frame.



A newcomer to the sidecar field—the 4 h.p. Omega



One of the few medium powered dual-purpose mounts with a spring frame—the 4 h.p. Coulson B.

Stand **HOSKISON.**

51. Hitherto the makers of the Hoskison have specialised on lightweight machines, but a new 4 h.p. model will be shown. Special features are Best mechanical oil pump, extra large mudguards and light car tyres. The front brake acts on a dummy belt drive, while chain-cum-belt transmission is used.

Stand **BLACKBURNE.**

72. The Blackburne engine is used on an enormous number of machines assembled by various makers, but those who prefer a machine built throughout in the same factory will be interested in Messrs. Burney and Blackburne's exhibit. The 4 h.p. model is equipped with all-chain drive through a Burman three-speed gear box, and has 28×3in. wheels. Neat design in the sloping top tube frame and attractive black and red finish contribute to the pleasing appearance.

Stand **DALTON.**

15. A product of Manchester, the Dalton 4 h.p. Blackburne engined model represents a careful assemblage of well tried components in a neat sloping top-tube frame. The layout is on semi T.T. lines, with three-speed gear and final belt drive; 26×2½ (oversize) tyres are fitted.

Stand **OMEGA.**

27. Under the above name the products of Messrs. W. J. Green, Ltd., of Coventry, have chiefly become known as a result of the success of the popular 2¾ h.p. four-stroke models. A new type, however, incorporating a 4 h.p. Blackburne engine will be staged, and its frame design is particularly clean and workmanlike, although more or less conventional lines are followed.

Stand **WILKIN.**

146. All the new features incorporated in the Blackburne-engined Wilkin have been tested in the "round-the-coast" ride which was carried out by the designer under A.C.U. observation. The improvements naturally are of a practical kind, and include adjusting devices for the gear box and magneto drives, as well as wider and more substantial mudguards and readily detachable chain-cases.

Stand **VERUS.**

161. Despite a comparatively recent entry into the world of motor cycle competitions, the Verus machines have secured an enviable record during the past two years. Their success has been widely associated with the Blackburne engines, which the makers, Messrs. A. Wiseman, Ltd., of Birmingham, have largely used. A new 4 h.p. model will be shown, and its special claim to notice is the fact that its overall dimensions render it equally suitable for the soloist who requires a handy machine, and for those who have need for a sidecar.

Stand **SHEFFIELD HENDERSON.**

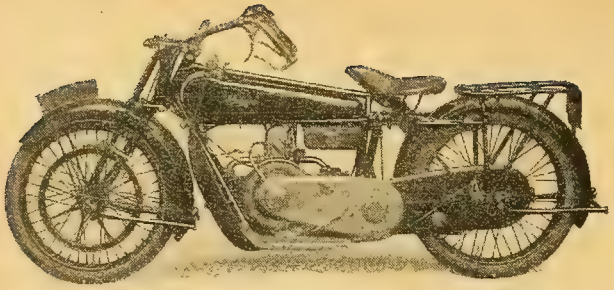
44. The well-known sidecar makers of Sheffield are turning their attention to motor cycles, and although Blackburne engines and Sturmey gears will be used, the rest of the specification will break away from conventional lines. New and practical ideas in frame construction and springing are being introduced.

Stand **REX.**

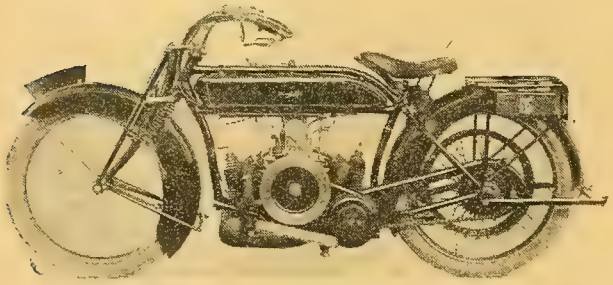
84. In addition to a smaller and a larger Rex machine with Blackburne engines, built for solo and sidecar work respectively, a medium-weight double-purpose model will be shown. This has a 4 h.p. Blackburne engine, and although the general specification is similar to the big twin outfit, a shorter wheelbase has been arranged, and the interchangeable wheels are eliminated.

Stand **NEW SCALE.**

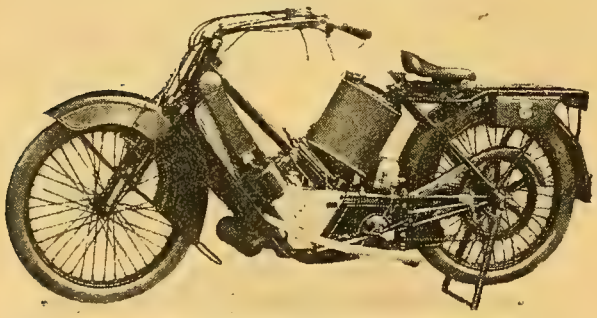
130. The makers, Messrs. Roberts and Hibbs, Ltd., of Manchester, have hitherto specialised on two-stroke machines, but they are now entering the lists with a 4 h.p. double-purpose model. Much care has been devoted to providing a machine of neat appearance and good proportions,



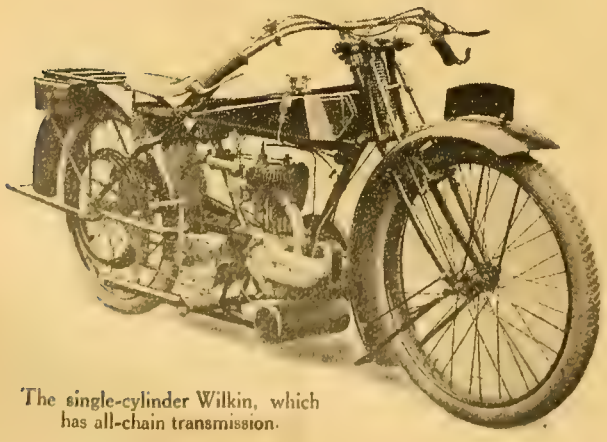
The spring frame flat twin Raleigh attracted a great deal of attention at the last Show. This is the production model.



A double-purpose flat twin—the 4½ h.p. Humber, which is one of the quietest machines on the road.



Despite the fact that it has held its unique position for several years, the water-cooled Scott remains the only twin two-stroke on the market.



The single-cylinder Wilkin, which has all-chain transmission.

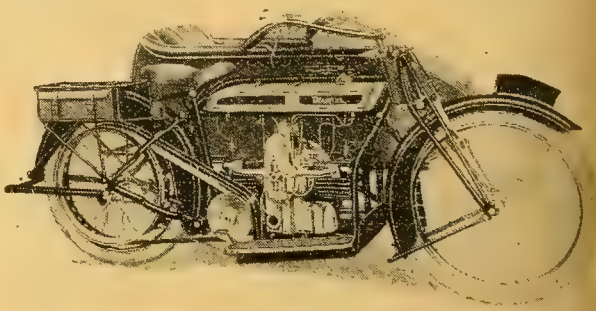
making the best use of standard components. A Blackburne 4 h.p. engine, Sturmey gear box, and chain-cum-belt transmission are used, while the Brampton forks carry a brake which acts on a dummy belt rim on the front wheel. Wide mudguards are used, and the finish is a handsome all red, the tank being finished in aluminium.

Stand **COULSON-B.**

162. Although the Coulson-B machines made quite an unobtrusive beginning, they have come forward in strides, proving their worth on track and road in no uncertain manner. Some practical detail improvements have been carried out for the new models, the greatest being a lowering of the saddle position by six inches. The spring frame and the special forks common to all the products of Messrs. The F. Aslett Coulson Engineering Co., of Albion Street, Kings Cross, N.W.1, are naturally used on the 4 h.p. model, which also has sidecar lugs incorporated in the frame.

Stand **DOUGLAS.**

126. Very popular for light transport and passenger work with the British Forces in France, the return of the 4 h.p. Douglas sidecar outfit last year to more peaceful spheres saw several detail improvements. This year, however, it has not been found necessary to make any alteration. The even torque of the flat twin engine makes this machine a fascinating solo mount in addition to a capable passenger outfit.



The 4 h.p. Douglas is equally suitable for solo and sidecar.

Stand **RALEIGH.**

99. The interest aroused last year by this exhibit will certainly be repeated and possibly augmented, for the promising product of the famous cycle firm has not yet reached the hands of the general public. Its salient features include, of course, a 698 c.c. flat twin engine and a simple but efficient spring frame, which permits full chain cases to be used. 1921 improvements comprise a strengthened rear frame structure, an improved mudguard fastening, an independently detachable rear chain case, and wide effective leg shields, which also act as air deflectors for the cylinders. The toolbag is carried under the tank.

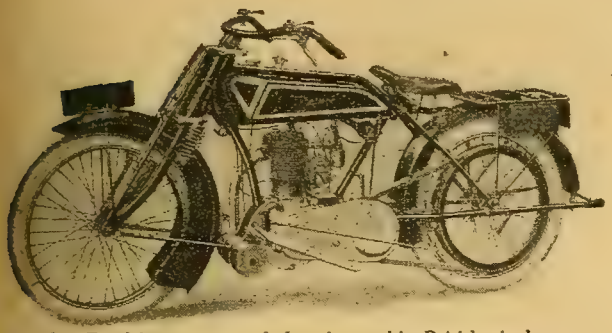
Stand **SCOTT.**

148. The makers of the Scott do not change their design for changing's sake; in this respect they are like an equally famous automobile firm who modify their production as necessary and not seasonally. Therefore, although no change has been announced, and little change is apparent to the eye, several small improvements have recently been incorporated, particularly some tending to strengthen the frame. Sectional and dissected exhibits will attract much attention on the Scott stand.

Stand **HUMBER.**

86. The 4½ h.p. Humber has been decidedly prominent in most of the recent and severe reliability trials, and, as a sidecar machine, it was the lowest-powered outfit of its type to come through the A.C.U. Six Days Trials with first-class honours. In addition to reliability, silence is an outstanding feature of the 75×68 mm. (600 c.c.) flat twin engine, and the T.T. model, with footrests in lieu of footboards, is a most attractive solo mount.

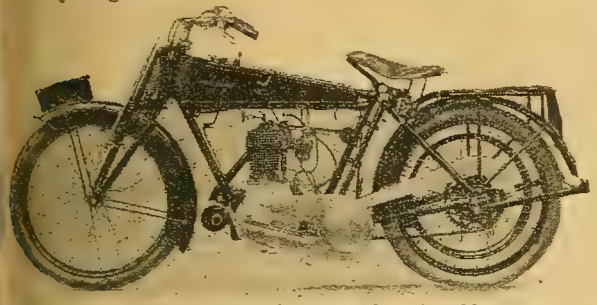
Section III.—MACHINES FOR SIDECAR WORK.



The Excelsior was one of the pioneer big British singles, and is re-introduced in a modified form.

Stand **BRITISH EXCELSIOR.**

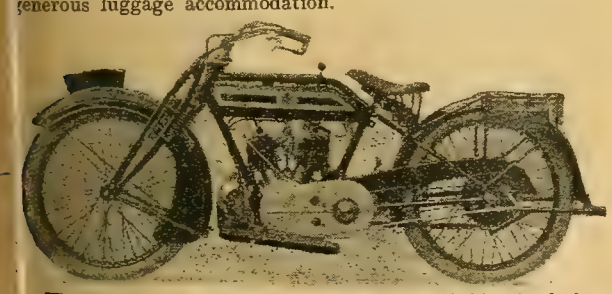
67. The 4½ h.p. Excelsior is a post-war modification of a successful pre-war machine from a factory which pioneered the big single. It was designed to meet the demand for a full tourist outfit at a moderate price, and for that reason several of the luxuries, such as interchangeable wheels offered in the Excelsior big twin, have been omitted. The price is £125, or £160 with sidecar. The larger machine, which is offered with either 6 or 8 h.p. engine, is very little altered from last year's model. It has enclosed all-chain drive, interchangeable wheels, and a *de luxe* sidecar of unusually large size.



A big single which, with sidecar complete, is sold at a very moderate price. The 4¾ h.p. Quadrant.

Stand **ROVER.**

89. Successful as a medium-sized twin sidecar machine, the 5-6 h.p. Rover for 1921 remains practically as in the present year. It is interesting to observe that several machines of this type—or rather using this size of J.A.P. engine—will be staged at Olympia, which fact must be taken as a direct compliment to the New Rover Co. In 1920 it was almost alone in using the particular size of engine employed, and it occupied a midway position between the 3½-4½ h.p. and the 6-8 h.p. classes. All chain transmission is used, the rear element being of the Brampton spring link type which has proved very satisfactory. By reason of good design and artistic coachwork, the Rover sidecar is now quite one of the most pleasing vehicles on the road. The body is one of the few that retain a sporting and clean outline, and yet provide ample comfort for the passenger and generous luggage accommodation.

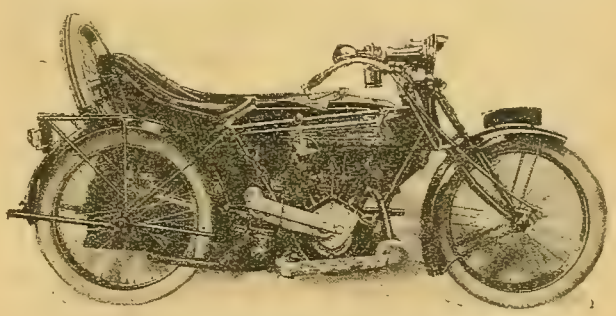


The 5-6 h.p. twin Rover which has set a new fashion in dual purpose machines.

One of the largest machines with chain-cum-belt transmission —the 8 h.p. Rex, which will also be made with all-chain drive.

Stand **BLACKBURNE.**

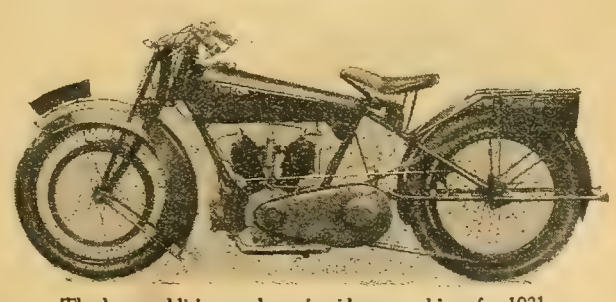
72. The large Blackburne twin, which is by reason of its outside flywheel, one of the smoothest running machines on the market, is naturally the power unit of the 8 h.p. Blackburne sidecar outfit. This machine possesses the inherent advantage of being designed—engine and cycle—as a whole for production in the one factory. Internal engine improvements for 1921 include roller bearings to the big end, a lighter piston and a micrometer adjustment to the small timing pinion. While instead of being screwed into position the magneto pinion is now fitted on a taper, thus following more conventional practice. The outfit, as a whole, is thoroughly designed, having all chain drive and interchangeable 28×3in. wheels.



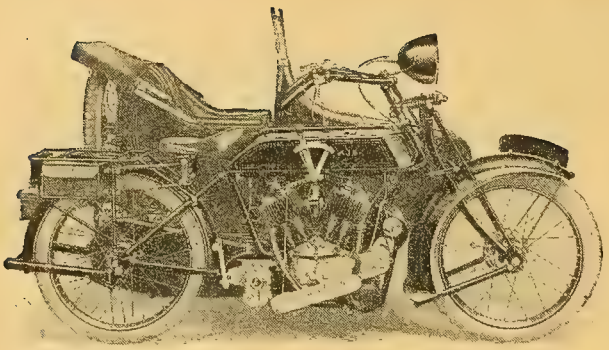
The Blackburne '8' offered by the makers of the well-known engine.

Stand **REX.**

84. A mount that has made a name for itself in a remarkably short time, after its introduction, the 8 h.p. Rex sidecar outfit has a more complete specification than the majority of large sidecars. Excellence of design and a long-established name, famed years ago for very advanced products, are probably equally responsible for this rapid success. A choice of J.A.P. or Blackburne engines is offered, while the remainder of the machine is consistent with the high quality of either of the power units. For 1921 an all-chain driven model will be exhibited, which will no doubt appeal to the many riders who prefer a rigid drive for a heavy and powerful outfit. A special taxi-sidecar will also be shown, and for the work associated with this class of vehicle the dimensions and power of the Rex should be ideal.



The latest addition to the twin sidecar machines for 1921— the 5-6 h.p. Omega-Jap.



One of the most popular sidecar machines—the A.J.S., noted for its refinements and good finish.

Stand **LEA-FRANCIS.**

58. The 5 h.p. M.A.G.-engined Lea-Francis is the product of two firms who both are noted for super workmanship and detail finish. Therefore, those interested in such refinements will welcome a "small twin" sidecar outfit. As the engine capacity is only 592 c.c., the term "miniature" is almost justified. The three-speed gear box is new and is of the constant mesh type. All the selecting mechanism is mounted above the box, and the whole is surmounted by a very large oil filler cap. Situated on the engine-shaft, the clutch is of the dry multi-plate class, and both chain cases are of cast aluminium.

Stand **ARIEL.**

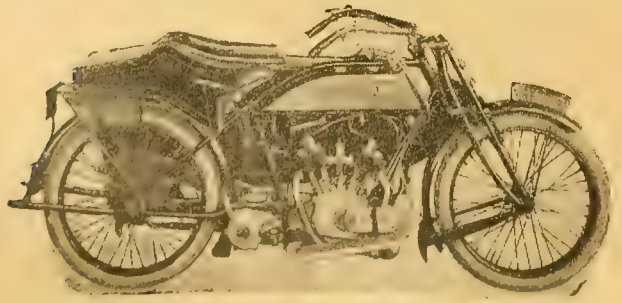
97. Many buyers of "passenger" machines require something more powerful than the popular big single, and yet do not wish to go to the other extreme and buy a *de luxe* 1,000 c.c. outfit with its much greater initial and running costs. To such the 6-7 h.p. (795 c.c.) Ariel should appeal strongly. In general outline it is somewhat similar to the 4½ h.p. machine, described elsewhere in this issue, with exception, of course, of the long-stroke twin engine. Great economy is claimed for this machine, and, with 28×3in. tyres, it is a serviceable addition to the range of medium-powered twins. The sidecar has a capacious locker at the rear which renders a luggage grid unnecessary.

Stand **BRADBURY.**

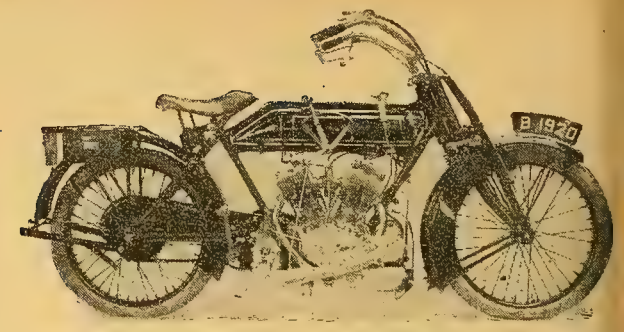
60. The leading Bradbury model for 1921 will be the 6 h.p. sidecar machine, which is a fine example of a design where strength and reliability are first considerations. Nevertheless, it possesses many other pleasing refinements. For instance, detachable cylinder heads make the process of decarbonisation less tedious, and an efficient magneto shield and large footboards are useful fitments, as also is the quickly detachable rear wheel. The drive is by chain through a Bradbury three-speed countershaft gear box. Guards only partially enclosing both chains are somewhat unusual on big sidecar machines, but the advantage, should a chain break, is at once apparent.

Stand **JAMES.**

88. Speed and reliability are proved attributes of the new 7 h.p. James sidecar outfit, which, in a trial form, has been well tested in competition work this year, and of which a full description appears on page 643 of this issue.



Of nearly 800 c.c. capacity, the 6-7 h.p. Ariel, with 28×3in wheels, is capable of hauling heavy loads.



The Bradbury "6" was one of the group of machines which set the fashion for this type of sidecar mount.

Stand **B.S.A.**

69. For many years the B.S.A. had been famous as a single, and the introduction last year of a twin naturally caused much comment. Time has proved that in this case anyhow the old rule that a firm specialising on singles cannot make twins does not hold good, and this machine should meet with an even greater reception this year. Externally and internally the engine is a fine piece of work, and all details have been carefully thought out. Lubrication is by means of a mechanical oil pump, which ensures a constant supply of oil under all circumstances, and yet ensures that the front cylinder is not starved at the expense of the rear.

Stand **A.J.S.**

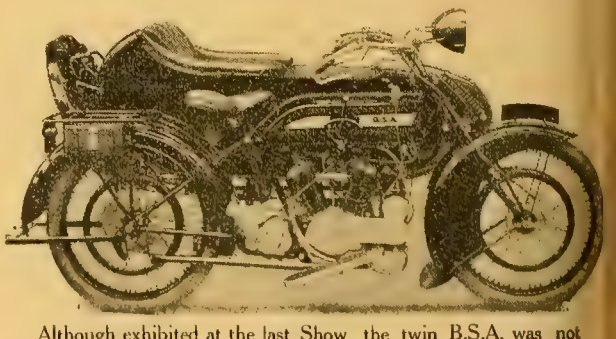
119. That extra ounce of power has been granted to A.J.S. enthusiasts for 1921. For the engine size is to be increased from 749 c.c. to 800 c.c., and the makers' rating is now 7 h.p.—a conservative figure, we should imagine. With the exception of a few racing lightweights, one of which won the Junior T.T. this year, the firm now concentrate on their sidecar outfit, which is one of the most luxurious and completely equipped in existence.

Stand **COVENTRY VICTOR.**

227. Of especial interest to the small dealer and trader, this machine is sold only in its component parts for building up by individual agents, under their own names and transfers. The flat twin engine of 688 c.c. is an accessible and well-constructed job, and the other details are evidently the work of keen motor cyclists and clever designers. For example, the tank holds no less than three gallons of petrol, and one of oil. The finished machine is most attractive.

Stand **MARTINSYDE.**

163. Everything stands in the favour of the Martinsyde sidecar outfit. It is the modern design of a practical motor cyclist—Mr. H. Newman—and is produced in the finely equipped works of Messrs. Martinsyde. Thus no considerations of established precedent or the retarding influence of existing drawings, jigs, and tools should hamper this effort. A natural temptation to depart radically from conventional lines has been overcome, and the result is both sound and interesting. For 1921 the rear frame will be slightly altered, but otherwise the machine remains unchanged.



Although exhibited at the last Show, the twin B.S.A. was not produced in any great quantities this year. It will be seen at Olympia with several improvements.

The largest of the three 1921 Sunbeams—an 8 h.p. Sidecar machine.

Stand **QUADRANT.**

41. Designed by a pioneer motor cyclist—Mr. T. Silver—the big single Quadrant is one of the lowest-priced full touring sidecar outfits on the 1920 market. Its low price, however, was not made possible by poor workmanship and finish. For 1921 two types will be offered—4½ and 6 h.p.—the latter is referred to at length on page 651

Stand **ARIEL.**

97. The 4½ h.p. Ariel described elsewhere in this issue is purely a sidecar machine having 28×3in. wheel and a frame of a type too heavy for solo use in the hands of the average user. It is one of the few singles designed exclusively for sidecar work, no attempt being made to evolve a compromise which would be a little too light for "double harness" or a little too heavy for solo riding. This year the Ariels will have a royal blue tank finished in black and gold.

Stand **ARMIS.**

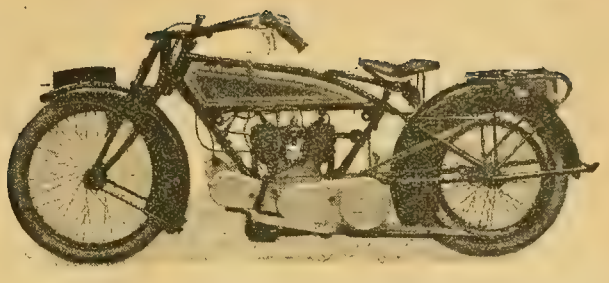
22. A comparatively newcomer to the motor cycle field, the Armis has made steady progress as a lightweight during the present year. A sidecar mount, however, is an entirely new proposition, and the model which will be exhibited at Olympia promises to attract attention on account of its compact design. It will be fitted with a 5 h.p. J.A.P. engine and Burman gear box, and the frame will be of the sloping top tube type. The moderate selling price and comprehensive specification of this outfit should make a ready appeal to family men not blessed with ultra deep pockets.

Stand **SUNBEAM.**

129. Improved only in minor details, the 8 h.p. model will again be included in the Sunbeam range. Fitted with an 8 h.p. J.A.P. engine, this machine holds a similar position in the big twin field to that enjoyed by the 3½ h.p. Sunbeam. The all-chain transmission is enclosed in oil bath cases which, in conjunction with the efficient shock absorber, renders the drive as sweet as that obtained by means of a belt. The wheels are shod with 28×3in. tyres, and a spare is carried on the commodious sidecar, which, like the machine, is finished in the well-known Sunbeam style in black and gold. Although the 3½ h.p. Sunbeam, despite its low capacity engine, is very popular for sidecar work, many have a prejudice against the "3½" for passenger work. For these, the 8 h.p. outfit is intended—and, after all, a big twin is certainly more suited to the overloading nowadays prevalent, and gives that extra ounce of power and that extra thousand miles before decarbonisation that fulfil the requirements of the really "hard" user. Probably after the initial expense be overcome it is possible to run a big twin outfit as cheaply, if not more so, than a "single"—but the choice, of course, is a matter of individual preference.

Stand **OMEGA.**

27. Having 26×3in. wheels, a 5-6 h.p. J.A.P. engine, and a comparatively long wheelbase, the new Omega-Jap sidecar machine should prove an interesting proposition. During the past two years the Omega-Jap lightweight has earned for itself a reputation for reliability and sound workmanship, and a sidecar machine from the same works is probably what a number of Omega riders require, for every year sees a certain number of soloists joining the ranks of sidecar users. The equipment of the new model includes Brampton forks, Sturmey-Archer gear, and Amac carburetter, and the saddle tank has a capacity for over two gallons of fuel. A special feature of this machine is the care with which the frame design has been carried out; this is specially noticeable in the case of the bottom bracket casting, which presents a clean and rounded upper surface, with strengthening ribs underneath.



On the 8 h.p. Coventry Acme the magneto drive is taken from the mainshaft.

Stand **COVENTRY ACME.**

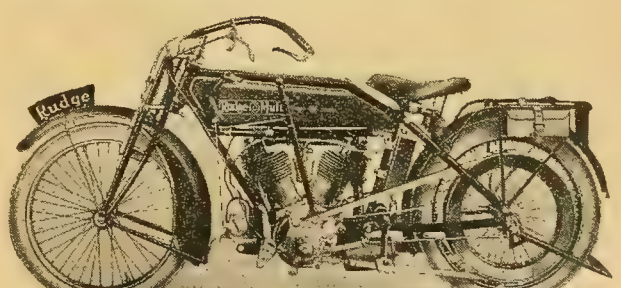
85. An 8 h.p. J.A.P.-engined machine with many points exclusively its own. For example, the magneto drive is taken from the main shaft, the reduction in speed being obtained by a chain and sprockets, the one on the magneto being twice the diameter of the driver. The machine has a particularly long wheelbase which makes for greater comfort, while the wheels are 28×3in., quickly detachable and interchangeable, a spare being carried at the rear of the sidecar. A capacious boot is fitted to the sidecar body. For 1921 an all-chain model will be added to the range, while a J.A.P. 6 h.p. engine will be supplied at option. Adjustable handlebars, Sturmey-Archer gear, and a 2½ gallon tank form part of the very complete equipment.

Stand **ROYAL ENFIELD.**

118. The main new feature of the 1921 Royal Enfield sidecar outfit is the new engine, which is made specially for this machine by Messrs. Vickers, who appear to have put into its construction the same quality of workmanship which characterised the Vickers gun. The late war showed a large number of our readers the quality of the gun, and an engine from the same factory makes the Enfield slogan "made like a gun" more apt than it has ever been. The capacity (*i.e.*, 996 c.c.) remains the same as hitherto. One of the features of the new sidecar is the fixing of the mudguard on the body, which permits a large locker to be fixed between the two. Further reference to this model is made on another page.

Stand **BAT.**

59. A pioneer machine with many distinctive features, the 1921 Bat-Jap promises to enhance its present high position in the world of wheels. The well-known Bat suspension is retained, and for the benefit of new readers we would point out that this takes the form of a sub-frame which carries the rider completely insulated from road shocks. The engine is an 85×85 mm. twin J.A.P., and the gear box is a Sturmey-Archer. 28×3in. wheels are fitted, and the transmission is by chain throughout. As usual, the finish is in all grey.



The big twin Rudge with its Multi gear, makes a fast sidecar machine in a class it shares with only one other.

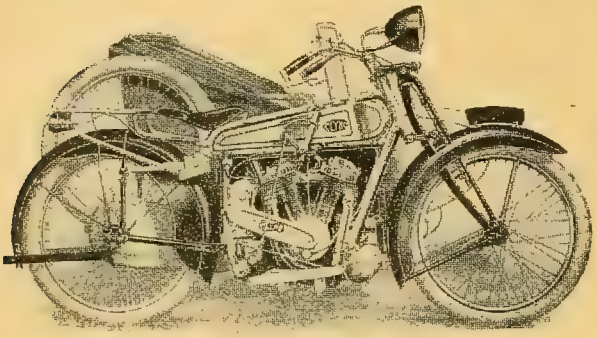
Forecast and Guide to Olympia.

Stand **HAZLEWOOD.**

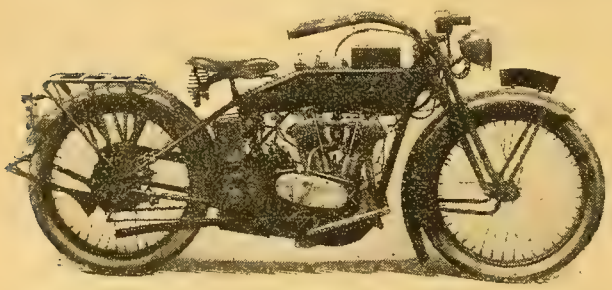
96. A Coventry big twin which has always been regarded as a high-class machine. There are several modifications in the 1921 models, including a saddle tank. These, however, are referred to in a description of the machine appearing on another page.

Stand **ROYAL RUBY.**

125. This fully sprung 8 h.p. outfit, which is illustrated and described elsewhere in this issue, attracted a great deal of attention at the last Show. It has an 8 h.p. J.A.P. engine, Sturmey-Archer gear, all-chain transmission, and equipment of the highest class. The sidecar is equipped with a windscreen as a standard fitting.



Four big twin sidecar outfits with spring frames will be shown at Olympia. This is the Clyno "8," which is finished in grey and black.



The Harley-Davidson—one of a trio of American big twins on the British market.

Stand **RUDGE.**

113. The twin-cylinder Rudge made its first appearance at last year's Show, and it will be exhibited again in the same form. To those who favour the expanding pulley type of gear and direct belt drive (which is at its best when ample power is available), the 7-9 h.p. Multwin makes a special appeal. Quite a new model, however, is the three-speed, all-chain drive sidecar outfit, which has detachable and interchangeable wheels and many similar refinements.

Stand **HARLEY-DAVIDSON.**

29. Amongst American machines the Harley-Davidson 7-9 h.p. passenger outfit has taken a prominent place. Its silence, smooth running and speed have earned for it a well deserved popularity. No drastic innovations will be seen on the Show models, one of which will carry the full electrical equipment, which has been standardised on the *de luxe* outfits.

Stand **MATCHLESS.**

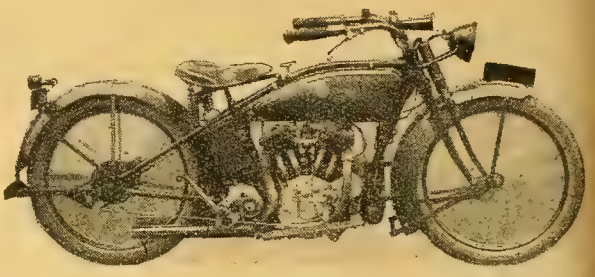
68. One of the most luxurious of British machines, the Matchless remains faithful to its system of coil springing, which is used for both frame and sidecar chassis. The engine is an 8 h.p. M.A.G., which is famous for its silence, long life and excellent workmanship. Detail improvements in the bearings of the detachable wheels have been carried out, but the general design is unaltered.

Stand **MASSEY-ARRAN.**

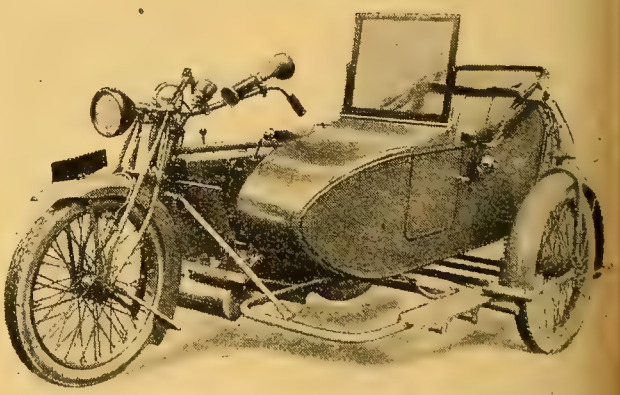
24. Among the new names at this year's Olympia will be that of the Massey-Arran. During the present year a limited number of lightweights have been marketed, and they have already earned a reputation for their refinement and high-class finish. The 5-6 h.p. model will be built with the same ideals which actuate the concern making it, i.e., to produce machines comparable with the very best. It is a high aim for a new firm, but a commendable one.

Stand **ZENITH.**

87. Detail improvements embodied in the 1921 Zenith-Gradua are dealt with in an article on the new models which will be found in this issue. An 8 h.p. sports model, minus a clutch, will be included in next year's range. The 5 h.p. model remains practically unaltered.



The largest twin on the market, the Reading Standard, fitted with an engine of 1,100 c.c.



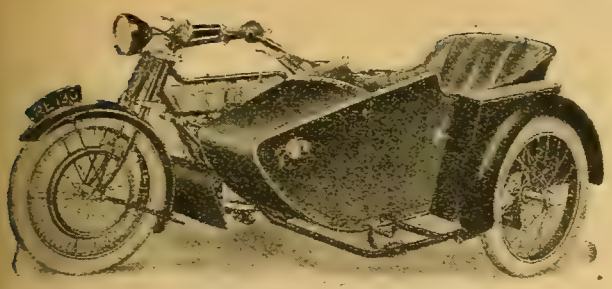
As usual, the 1921 spring-frame Matchless outfit provides the maximum comfort for owner and passenger.

Stand **CLYNO.**

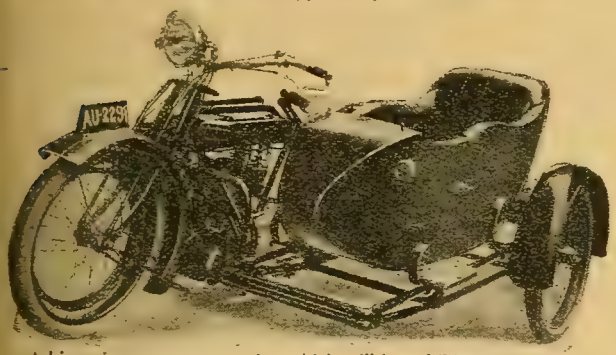
141. Despite the fact that troublous times have delayed the production of large numbers of Clyno outfits, the machine is one which has become much desired. This interest on the part of the public is due entirely to the attractive and workmanlike lines on which it is designed. Everything desired in the "ideal" specification is incorporated—mechanical lubrication, accessible engine, detachable wheels, simple chain cases, adequate mudguarding, electric lighting and luxurious comfort. The latter quality, of course, is due to the excellent system of frame suspension by laminated springs, which is also applied to the sidecar chassis. A hood and screen also ensure complete weather protection for the passenger.

Stand **INDIAN.**

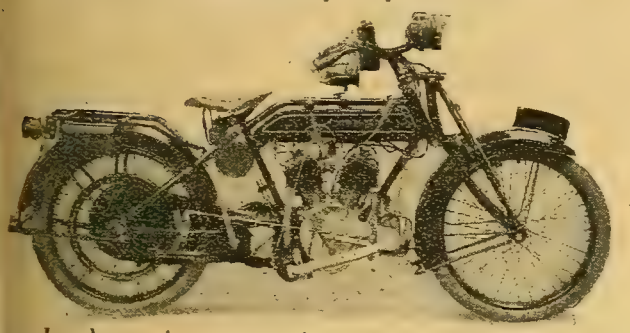
100. After some five years of continuous production, the 7-9 h.p. Indian remains unchanged. This is a splendid testimonial to the excellence of the design. The handsome finish remains unaltered, and its distinctiveness is such that it has made the machine one which is almost as familiar to the general public as to the community of motor cyclists. Laminated springs, as applied to motor cycle frames, were largely pioneered by the Indian machines, and such features as a built-in dynamo lighting system and interlocking clutch and gear mechanism, typical of American practice, are here seen in specially advanced form.



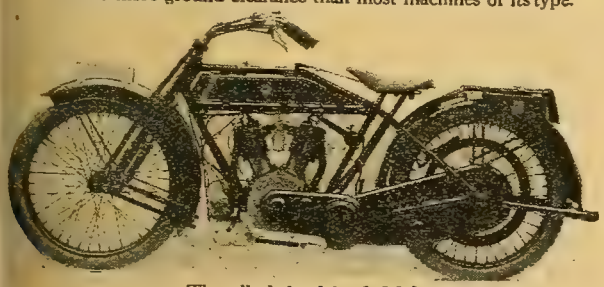
A Magdyno equipped Royal Enfield.



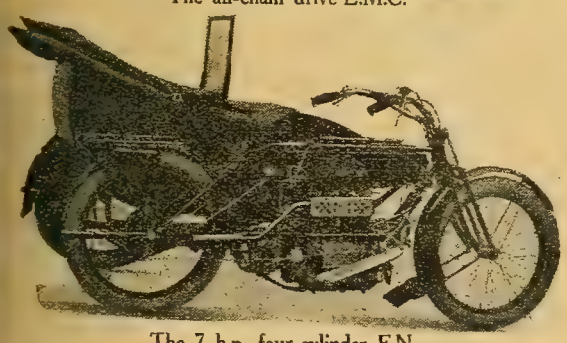
A big twin passenger machine which will be exhibited as a taxi sidecar—the 8 h.p. Campion.



In order to suit overseas requirements, the New Imperial big twin has more ground clearance than most machines of its type.



The all-chain drive L.M.C.



The 7 h.p. four-cylinder F.N.

Stand **READING-STANDARD.**

37. Possibly no American machine has approached the general lines of the conventional British layout so closely as the big twin Reading-Standard. The side-by-side valve engine has undergone several modifications, which make for an increase of efficiency, and the design generally is of great strength and simplicity.

Stand **F.N.**

139. An ever extending public are beginning to appreciate the charm of the four-cylinder, and this fact, combined with the F.N. reputation for excellence of material and workmanship, and that other advanced feature of design, final shaft drive, should together keep the rebuilt Belgian factory continuously busy. Although amply powerful (the cylinders have a bore and stroke of 52×88 mm. = 748 c.c.), this big F.N. is not weighty; in fact, considering the specification it is remarkably light, and 26×3in. light car tyres should contribute greatly to the comfort of the rider.

Stand **CHATER-LEA.**

90. Few firms have had greater experience in the building of passenger machines than Messrs. Chater-Lea, Ltd., and this year their popular "No. 7" outfit will be still nearer perfection. All wheels will be detachable and interchangeable. The front chain is now entirely enclosed, and the rear chain protected by means of a guard. A bracket for spare wheel is situated on the sidecar chassis.

Stand **L.M.C.**

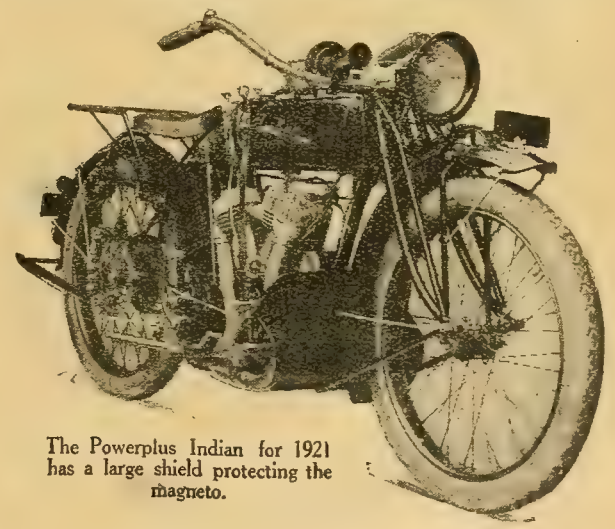
70. For a considerable time now colonial requirements have been the special study of the Lloyd Mfg. Co., Ltd., but either their standard or their special overseas model is interchangeable as regards suitability for home or colonial use. Indeed, the colonial model will undoubtedly appeal to many home riders, while the home model will no doubt similarly be suited to some of the less exacting localities abroad. The patent seat suspension is the chief feature of the machine, while the 960 c.c. twin engine is a sound job.

Stand **NEW IMPERIAL.**

91. The 8 h.p. New Imperial sidecar follows the lines of the 1920 model. Large leg shields which fully protect the rider from foot to thigh are the most important addition, and they are so arranged that an air draught is deflected to impinge upon the cylinders. The sidecar mudguard is now securely attached to the body—a construction much to be preferred to direct attachment to the axle of the chassis.

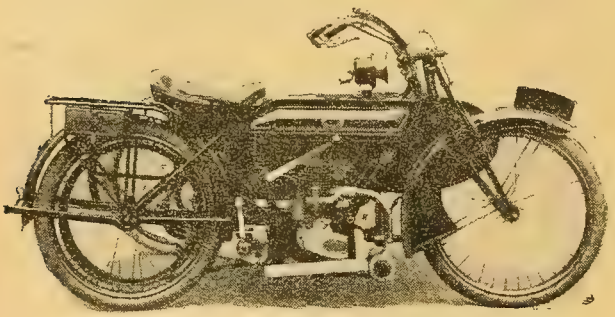
Stand **CAMPION.**

163a. The manufacturers of the Campion have been making big and very sturdy sidecar outfits for many years now, and it is not surprising that they should be one of the first firms to turn seriously to sidecar taxis.

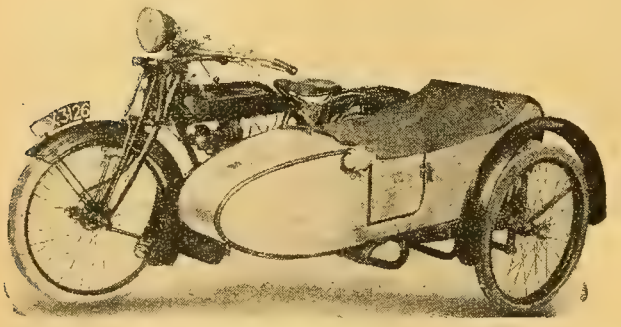


The Powerplus Indian for 1921 has a large shield protecting the magneto.

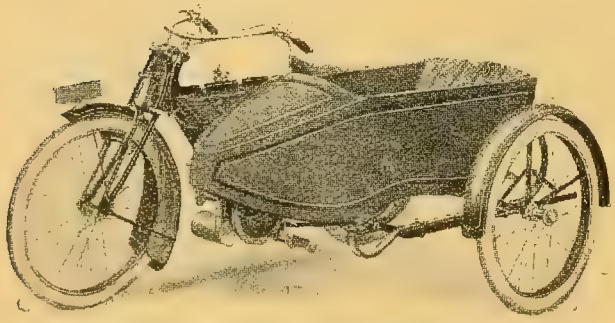
LIGHTWEIGHT SIDECAR OUTFITS.



One of the pioneer two strokes—the Connaught with its 293 c.c. engine—will be marketed as a sidecar outfit.



Having a 350 c.c. engine, the Alecto two-stroke is suitable for light sidecar work.



A sidecar model of the Ixion has been catalogued for several years and has given every satisfaction.

The Allon was one of the first two-strokes to impress us as suitable for light sidecar work.

Stand **IVY.**

124. By making fifteen consecutive ascents of the Old Wyche, Malvern, which has a maximum gradient of 1 in 2⅔, the makers of the 3 h.p. Ivy lightweight outfit have demonstrated that their production is a serious go-anywhere proposition. A two-speed Sturmey-Archer gear box with clutch and kick-starter will be used on this model, and the final drive is, optionally, belt or chain.

Stand **CEDOS.**

36. Sidecars have always been particularly in the sphere of feminine interest, but up to the present no firm has specifically designed a sidecar outfit for the lady driver. Judging, therefore, by the number of ladies who already drive standard machines, the new Cedos outfit should prove very popular. The larger Cedos engine (247 c.c.) and a two-speed gear box with clutch and kick-starter are fitted. Worthy of note is the fact that these machines are made throughout under one roof.

Stand **CONNAUGHT.**

95. One of the earliest small two-stroke sidecar outfits on the market, the Connaught, gave us some very satisfactory results when under test last summer. The capacity of the 73×70 mm. engine is 293 c.c. A new type of sidecar body is now provided with a locker under the seat, while the chassis is of the latest underslung pattern. Two speeds with clutch and chain-cum-belt are used.

Stand **ARMIS.**

22. A very popular power unit for this type of machine, the 350 c.c. Precision two-stroke, is used in the Armis, intended for sidecar work. Suitably geared, this outfit should easily attain the expected range of such machines.

Stand **ALLON.**

62. Recognising that serious sidecar work on a low-powered machine makes more than two gear ratios desirable, the makers of the Allon lightweight are substituting a three-speed gear of their own manufacture on this model. A specially light sidecar completes a very useful lightweight outfit.

Stand **BEARDMORE-PRECISION.**

115. A road test and full description of the Beardmore Precision lightweight sidecar appeared in our last week's issue. The chief feature of the sidecar is a flexible chassis specially adapted for use with the Beardmore spring frame.

Stand **OMEGA.**

27. Following popular lines, the 2½ h.p. Omega-Villiers sidecar is a good example of a lightweight outfit at a competitive price.

Stand **IXION.**

160. Constructed of sound and well-tried components, the Ixion sidecar outfit should gain a large following among the economically-minded public of to-day, who are largely attracted by a low initial cost and a promise of correspondingly low running expenses.

Stand **ALECTO.**

147. Although only of 76×76 mm. bore and stroke (345 c.c.), the little Alecto passenger outfit is rated by the makers at 3½ h.p., and recent Brooklands performances tend to prove that this is by no means a too optimistic figure. It will be remembered that the Alecto was the first two-stroke to break long distance records. For sidecar work a considerably stronger frame, a larger tank, bigger spring forks and wider mudguards are being standardised.

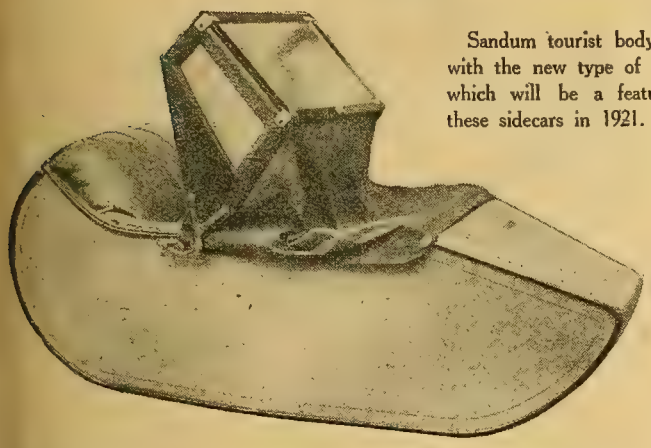
Stand **CALTHORPE.**

112. Among the wide range of Calthorpes for 1921, the small sidecar outfit will be by no means the least interesting exhibit.

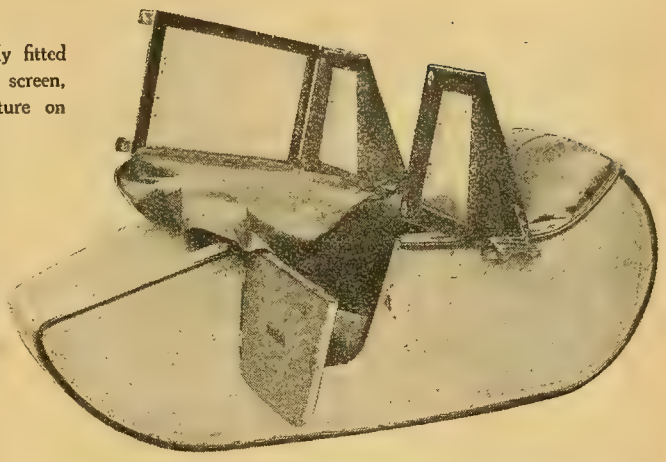
Stand **SCALE.**

130. One of the earliest firms to recognise the possibilities of the lightweight sidecar, the makers of the new Scale will show a 3 h.p. Precision two-stroke-engined outfit. Silence and comfort are two important points that have received especial attention here.

Section IV.—SIDECAR ATTACHMENTS.



Sandum tourist body fitted with the new type of screen, which will be a feature on these sidecars in 1921.



Stand **SANDUM.**

23. A remarkable selection of sidecars from a feather-weight racing shell to a double-seated sidecar taxi will be produced for next year by the Sandham Engineering Co., whilst a feature of their exhibits at Olympia will be the new Sandum screen.

A curved mica screen shields the rider from the front, whilst attached by clips to each side are substantially constructed side pieces, in the centre of which are mica windows. These side pieces are held by a metal fork to a universal link attached to the sides of the body, and the number of positions to which the screen can be adjusted is practically unlimited. A weather-proof cape attached to the bottom of the screen is fixed to the body in front, and completely excludes the wind and rain.

A body which should attract considerable attention is the two-seater sidecar taxi. It resembles in shape two large sidecars placed side by side with the centre partition removed. There is plenty of room for two persons, and it is possible for a six foot man to stand inside without touching the hood. An exceptionally large locker is located at the rear, and it is intended to accommodate suit cases or other small luggage. The upholstery is excellent, whilst the spring back rest and seat are very comfortable.

A screen will, of course, be fitted, and a special spring wheel chassis has been designed so that its width does not greatly exceed that of the sidecar.

Amongst the other exhibits is the Sandum two-seater, which was previously described in *The Motor Cycle*. The second seat is provided by lifting up the hinged bulbous back.

Other new models, the attractive appearance of which strikes the eye, are the new streamline model, low seated, and tapering towards the front similar to a boat, and the redesigned lightweight racing model. This latter body is extremely light, and is covered on the top only at the nose.

The seat is on the floor of the body, and permits the rider to assume a reclining position which offers little wind resistance for racing purposes.

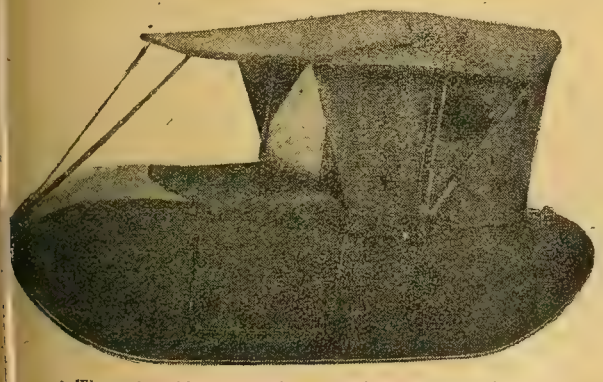
Many other sporting models will be shown, some with the back rest raised above the top of the body, and others deeper, which protect the rider to a greater extent from the wind and rain.

Stand **GRINDLAY.**

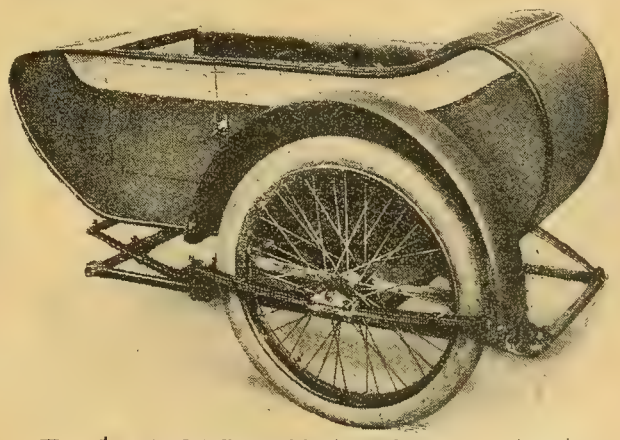
50. In addition to the model known during this year as the De Luxe, which has a sprung wheel and body suspended on cantilever springs, this spring chassis is being embodied in two new models. The first of these is a full tourist type with bulbous back, containing a large locker and, at option, a child's dickey seat. The body is roomy, well made and finished, and has a glove locker in the dash. The other new model embodying this double sprung chassis has a doorless body on sporting lines, but having a larger amount of room than is usual with this type of attachment. The dash is brought well back, and has a neat adjustable windscreen, which enhances its appearance, and provides extra comfort for the passenger. At the rear of the body there is a larger locker, upon the lid of which is secured a light grid to carry a spare petrol can.

The third new model is of the pure sporting type, small, light, low, and fitted with a leather hammock seat behind the back rest, of which there is a locker of useful capacity. This model has been designed for the larger type of lightweights and the spring frame A.B.C.

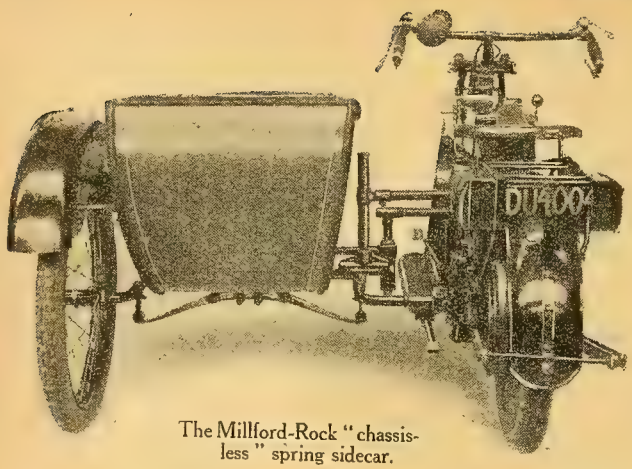
In all cases the mudguards are of round section and secured to the body. A full tandem sidecar is also under consideration.



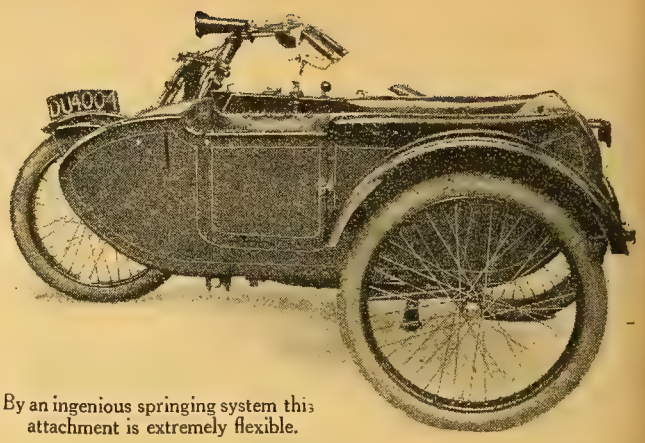
A Watsonian sidecar, affording complete protection for the passenger.



The full tourist Grindlay model with spring wheel and cantilever suspension for the body.



The Millford-Rock "chassis-less" spring sidecar.



By an ingenious springing system this attachment is extremely flexible.

Stand **RIDE-EASY.**

35. Among the exhibits of the Sidecar Body Co., of 25, Upper Clapton Road, London, E.5, will be a single-seater sidecar fitted with a novel disappearing hood.

Contrary to usual practice, it is constructed of metal, and in shape conforms to the contour of the back of the sidecar. When it is lowered and out of use it appears to be part of the body.

Its action is simple, and pivoted on two studs on the sides of the body, it is easily drawn over the seat and clipped to the top of the windscreen. By the provision of two rollers it can be lifted by two silk cords, attached to the top of the hood, when seated in the sidecar. A hinged dash provided with two side pieces of pleasing shape is fitted, whilst the roominess of the seat and the ample leg room provide a comfortable all-weather body. A locker of reasonable size and capable of holding a two-gallon tin of petrol is located behind the seat.

A luxurious sidecar, the bulbous model No. 4, suitable for Henderson and Harley-Davidson motor cycles, will also be shown. A hinged dash is again fitted, whilst the upholstery, which is in antique leather cloth, and the attractive sweeping lines of the body are most noticeable. An underslung chassis supports the body on two three-leaf C springs with solid shackles.

An enclosed wheel is now fitted to all sidecar chassis manufactured by this firm, whilst special chassis, suitable for all American machines, are also made.

Other models include the bulbous No. 2, which is slightly smaller than the No. 4, but is provided with an equally comfortable spring seat and back rest. A tool locker is located beneath the seat, whilst the price of this model complete is £26.

Another sidecar suitable for lightweight machines is the lightweight No. 5. It is well finished and has a distinctly pleasing shape, whilst the total weight of 25 lb. is comparatively small and would permit its use on low-powered machines. This body is mounted on a special underslung enclosed wheel chassis, and is sold for less than £20.

A very novel two-seater sidecar, it is hoped, will also be exhibited. The bulbous back is hinged, and when lifted back forms the second seat, whilst a well beneath the front seat provides ample space for rear passengers' feet.

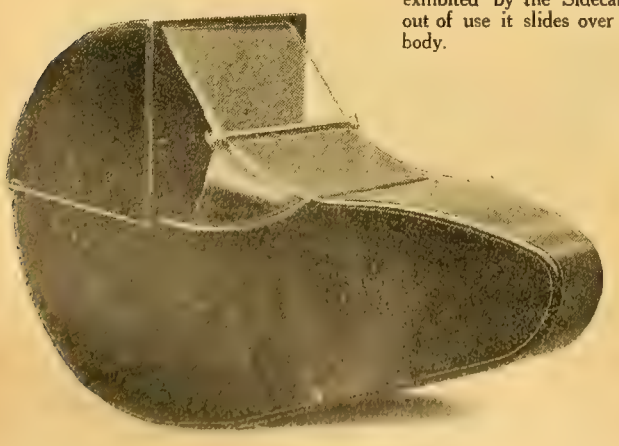
Stand **MILLFORD.**

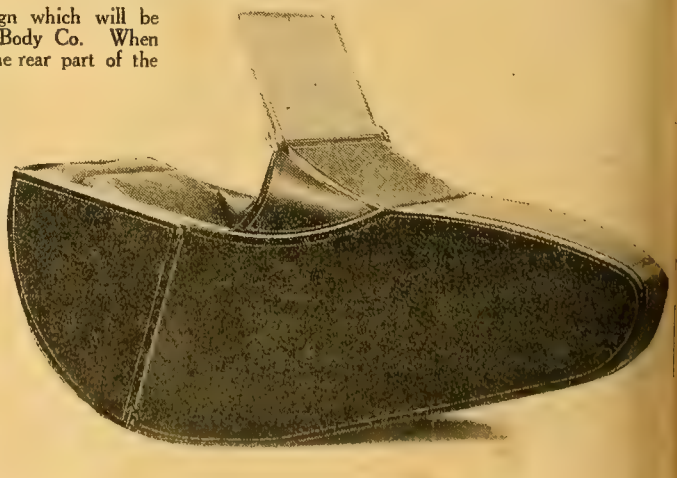
63. The leading sidecar of this well-known make for 1921 will be the Millford Rock, regarding which we recently gave a description of a demonstration. It will be recalled that the Rock sidecar chassis is an Australian invention, embodying a flexible construction from which a chassis, properly so called, is eliminated. From our experience we can say that it gives remarkable comfort. Several types of bodies will be used as hitherto, and these range from the small to the very largest type. The special feature of the springing system is that it may be instantly adjusted to any weight of passenger, while the axle is made from the solid bar, and is, therefore, practically unbreakable.

Stand **CANOELET.**

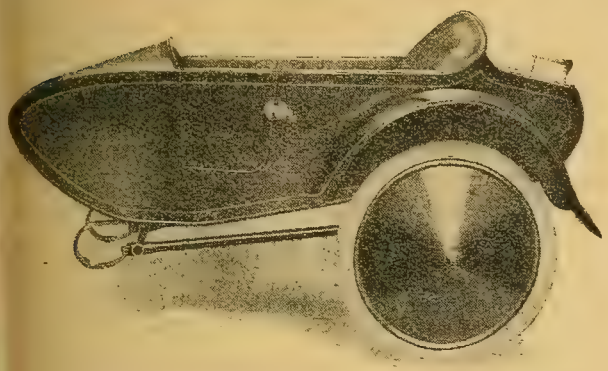
143. One of the first firms to introduce a coach-built sidecar body, Messrs. Mead and Deakin, of Tyseley, will show several new models which will be worthy successors of the well-known Canoelet range, while on many other stands the Canoelet will be shown fitted to well-known makes of motor cycles. Probably one of the most popular sidecars of its type on the road, the sporting Canoelet may be obtained in two models, the more elaborate of which has a hammock seat, and is strong enough for fast work on a heavy machine. A taxi-sidecar will also be shown.

A novelty in hood design which will be exhibited by the Sidecar Body Co. When out of use it slides over the rear part of the body.

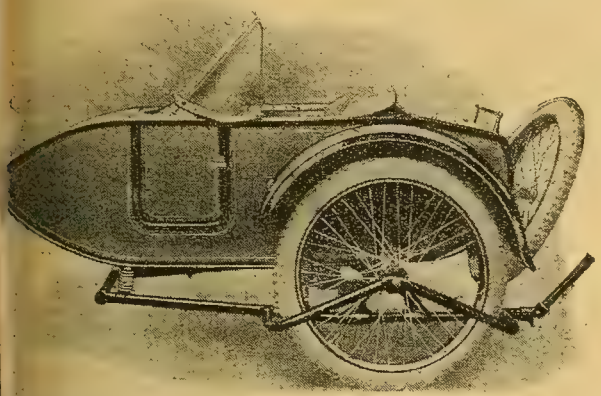




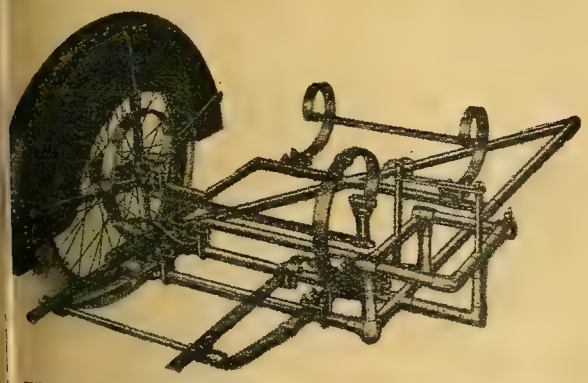
On one of the Watsonian new models a child's dickey seat forms part of the equipment.



That a spring wheel sidecar can be designed without sacrifice of neat appearance is shown from this view of the Henderson.



Luxurious equipment, refined springing and ample weather-protection are the special features of the Sheffield Henderson Elite sidecar.



The substantial chassis of Dunhill's touring sidecar, in which a spring luggage grid is embodied.

Stand **WATSONIAN.**

92. Like several other firms making sidecar attachments, the Watsonian Co., of Birmingham, will exhibit a sidecar-taxi. This is a large two-seater cabriolet, having a commodious locker at the rear which accommodates, among other things, a spare wheel. The rear half of the "top" takes the form of a hood which may be lowered at will. The front part is permanent. Several other interesting features will be noted on the Watsonian stand, among these may be mentioned a celluloid screen which has side pieces and hinges at the rear, the whole of the covering being pivoted at this point. The arrangement seems to offer the advantages of saloon type of body without undue weight. There are several types in the Watsonian range for next year, and they will embody many points of interest which show that they are the outcome of actual road experience.

Stand **HENDERSON.**

44. Coming from the centre of the steel making industry it is only fitting that the Henderson sidecar chassis should be constructed of specially selected materials. Every care is taken in the choice of the various grades of steel tubing used in the various parts, and the connecting stays are all made from material possessing a high elastic limit. Bolts which might be liable to corrode in their holes are made from rustless steel, while the wheel axles are of high tensile. The models range from a lightweight, suitable for machines of the smallest classes up to the Elite type, which is equipped to conform with the most powerful and luxurious machines to which it may be attached. Springing is a special feature of all Henderson sidecars, and an adjustable system combining leaf and coil springs suspends the body in each case. A spring wheel model of exceedingly neat design will be shown, and in all cases the mudguards are attached to the bodies instead of to the rigid portions of the chassis; this method of fitting was largely popularised by the makers of these sidecars which were amongst the first to be fitted in such a manner.

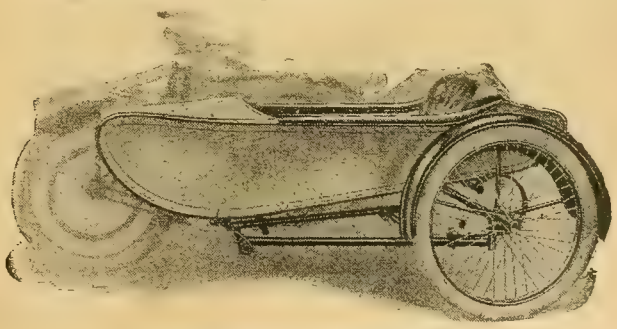
Stand **DUNHILLS.**

103. The essentials of the Dunhill designs are triangulation and strength. The lightweight chassis, one of the simplest forms of sidecar frame, has proved to be eminently satisfactory. We recently illustrated this chassis, which should give a maximum of strength for weight; and, although primarily intended for a light sporting body, comfortable springing has by no means been neglected.

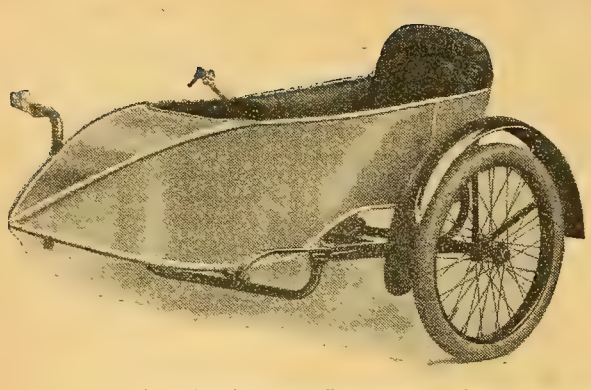
A heavier touring model, suitable for attachment to powerful twin-cylinder machines, will also be shown, and remains very much the same in design as the 1920 pattern, but it has been improved by the addition of a well-sprung luggage grid mounted on quarter-elliptic springs. The platform is 20×15in. Incorporated with the chassis, and forming an integral part of it, is a special spare petrol tin carrier, which is provided with an extremely ingenious clip, allowing the can to be quickly removed, and yet holding it securely in position.

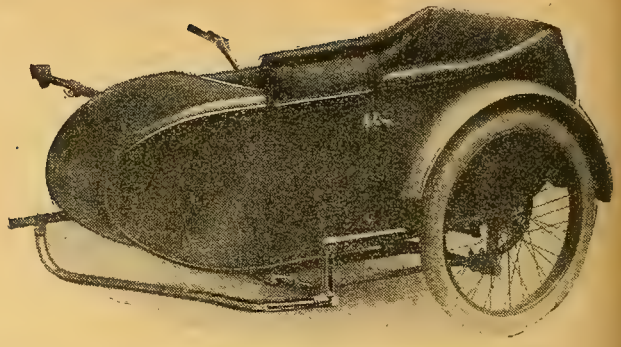
Stand **MONTGOMERY.**

46. One of the neatest sporting model sidecars in the Show will be exhibited by the well-known Montgomery firm, who will also have a complete range of their sidecar attachments suitable for all classes of motor cycles. The *de luxe* model is a particularly fine piece of work, intended for use with all types of machines of 4 h.p. and over. It has a hinged dash upon which is mounted an adjustable glass screen. The back contains a large locker.



The sporting model Montgomery.





Two Royal Leicester models—the "Racer" in polished aluminium and a "medium weight" with bulbous back.

Stand **ROYAL LEICESTER.**

137. Several new models of the Willowbrook Co.'s sidecar attachments will be exhibited, and the range will include a number of lightweight models of interest to those who wish to fit a sidecar to a medium-powered machine. A touring model built upon an entirely new style of chassis, having compensated coil springs, will be one of the leading features of the exhibit, and it is claimed that the springing system eliminates entirely any tendency to sway. In all cases, Willowbrook sidecars now have the mudguards fixed to the body, and therefore insulated from road shocks. This also reduces unsprung weight.

Section V.—RUNABOUTS.

Stand **COVENTRY PREMIER.**

94. The Coventry Premier runabout, which was introduced to the public at the last Olympia Show, will again be staged by the Premier Company. Several small alterations have been made, but none of these are of a very drastic character. The engine fitted is a water-cooled "V" twin, with a bore and stroke of 80 and 105 mm. respectively (1,055 c.c.). It may be recalled by our readers that this runabout has three speeds and reverse, and that the transmission is by shaft to the gear box, thence by an enclosed chain. The rear wheel is quickly detachable, and a spare wheel is carried on the tail of the body. One interesting point in connection with the Coventry Premier is the fact that the price has been reduced, and is now 275 guineas complete with dynamo lighting set.

Stand **MORGAN.**

93. There are several detail improvements of an important nature in the 1921 Morgan. Chief among these being the fact that the rear wheel may now be quickly detached without the necessity of disconnecting the chain links. This feature has been secured by a new type of rear fork which allows the axle to be slid along the fork ends for adjustment to the chain. By sliding the wheel to its most forward position, it is allowed to drop out of the forks when the chains can be lifted off the sprockets and left endless. Both chains are now of the same length, which has been rendered possible by fitting a certain combination of small and large sprockets. Gear ratios of 4½ to 1 and 8 to 1 are obtained. Others improvements include redesigned clutch withdrawal fork, which is of a very simple nature, and provides an easy action. Several models of the Morgan will be shown at Olympia, including two of the *de luxe* type, a Grand Prix, and a new Aero model, which has a streamline tail and V front air deflector behind the radiator. Another model will be the four-seater, which is suitable for two adults and two children. Prices range from £206 to £226.

Stand **NEW HUDSON.**

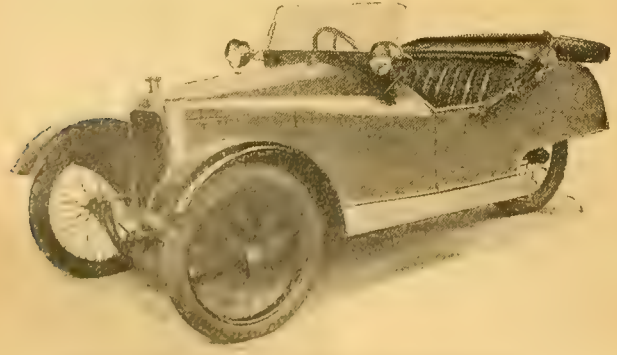
75. Undoubtedly one of the most interesting three-wheelers at Olympia will be the New Hudson, in which the company has pinned its faith as a passenger machine in lieu of a sidecar outfit. An air-cooled 50° V twin of 1,100 c.c. provides the power, and the transmission is by shaft and chain through a three-speed and reverse gear box. The rear wheel is quickly detachable. £300 is the price at which it will be offered.

Stand **STANHOPE.**

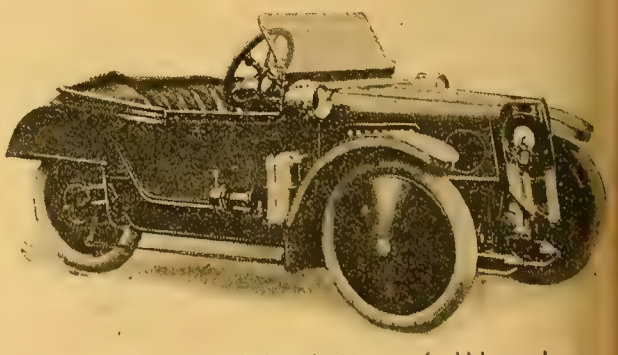
144a. Although exhibited for the first time, the Stanhope is by no means a new proposition. For several years it has been running about in its present form in the hands of its designers, and has earned quite a reputation for itself on account of its remarkable tractability. It is unlike any other three-wheeler at present made, inasmuch as the drive is to the single front wheel which is also the steerer. Although somewhat unconventional in appearance, it is not by any means unsightly, and now that the designer is entering the market with it, we see no reason why it should not be a successful commercial proposition.

Stand **T.B.**

31. Two models of the T.B. three-wheeler will be offered next year, one being equipped with an 8 h.p. water-cooled twin engine, and the other with an air-cooled engine of a similar type. This vehicle has all-shaft drive, and the gear box provides three speeds and reverse. It is manufactured by Thompson Bros. (Bilston), Ltd., Staffs., and includes several unusual features, amongst which must be included a neat detachable wheel. From personal experience we can state that the water-cooled model is speedy and quiet on the road and well sprung. A single seater is also made.



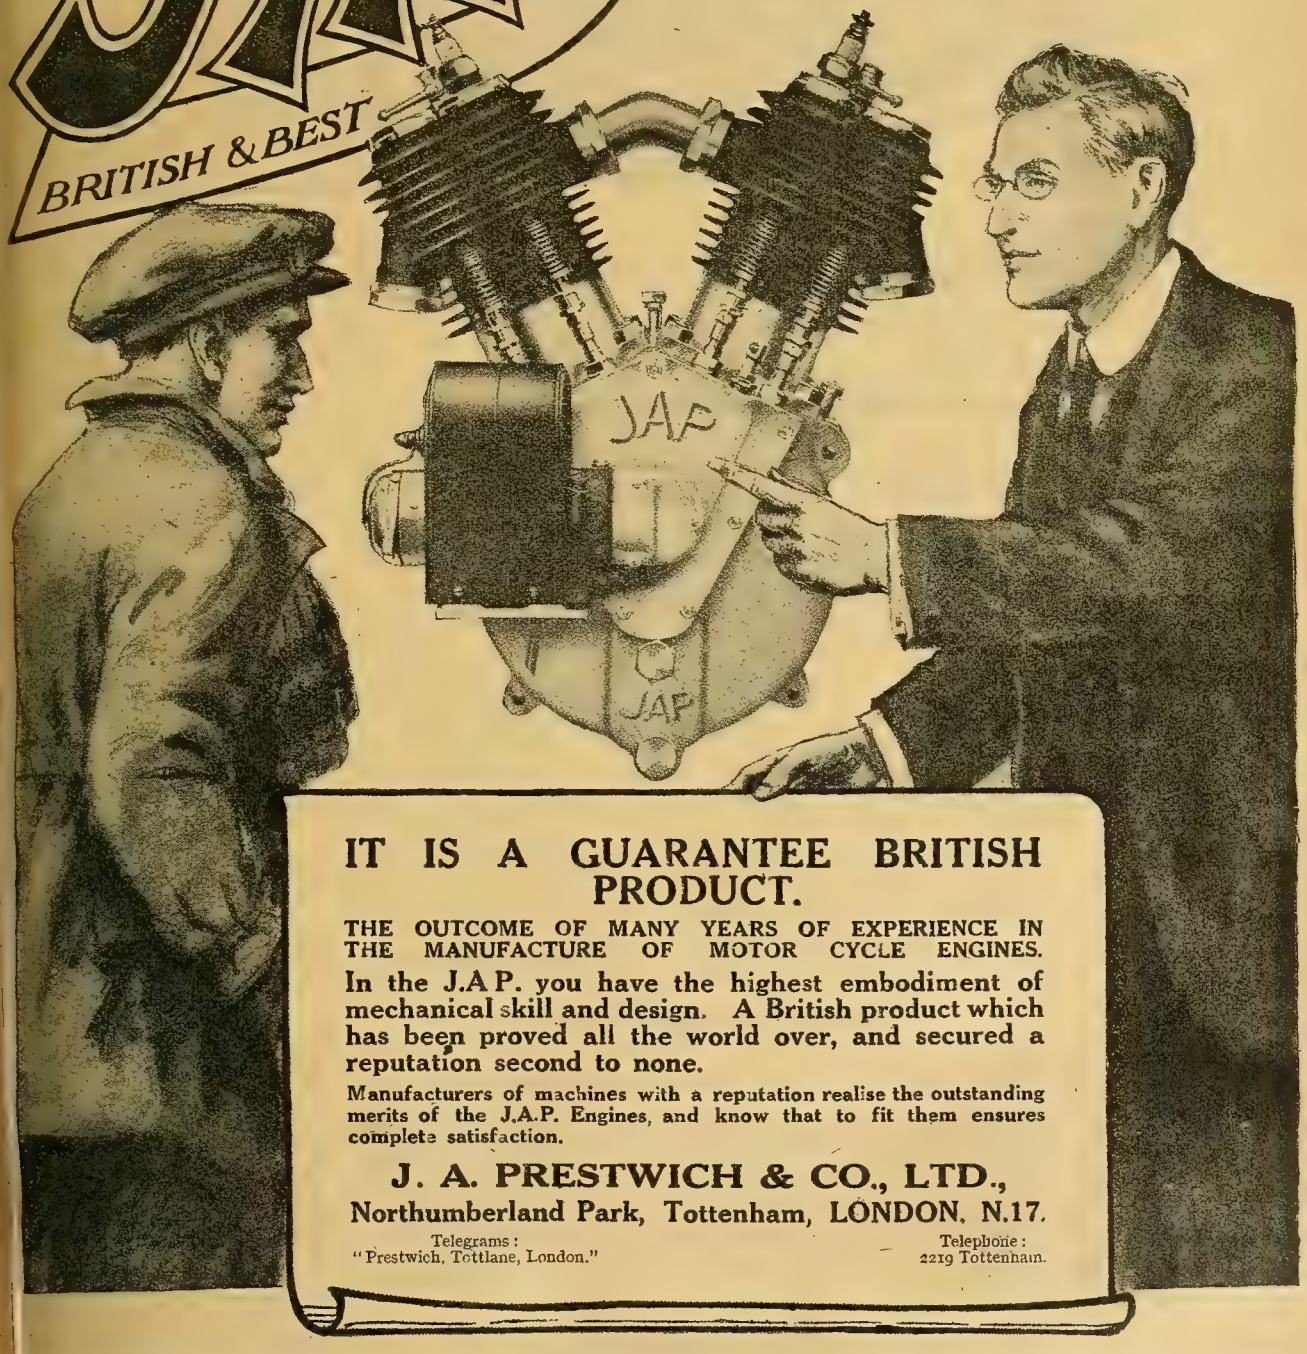
A refined little machine with a very complete specification—the Coventry Premier runabout.



The three-wheeler, which made this type of vehicle popular—the Morgan.

SEE THAT YOUR MACHINE IS FITTED WITH A J.A.P. ENGINE

BRITISH & BEST



IT IS A GUARANTEE BRITISH PRODUCT.

THE OUTCOME OF MANY YEARS OF EXPERIENCE IN THE MANUFACTURE OF MOTOR CYCLE ENGINES.

In the J.A.P. you have the highest embodiment of mechanical skill and design. A British product which has been proved all the world over, and secured a reputation second to none.

Manufacturers of machines with a reputation realise the outstanding merits of the J.A.P. Engines, and know that to fit them ensures complete satisfaction.

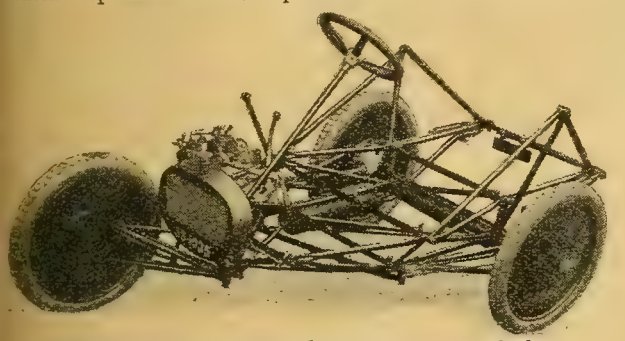
The Castle-Three, a runabout having a four-cylinder water-cooled engine and shaft drive.

Stand **CASTLE-THREE.**

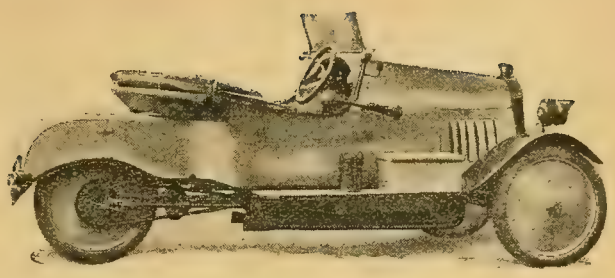
42. A fully developed three-wheeler on car lines, the Castle-Three runabout is probably the last word in three-wheelers, having a four-cylinder water-cooled car type engine of 1,207 c.c. capacity, and all shaft drive through an epicyclic gear, giving two forward speeds and reverse. The vehicle has many commendable features, many of the working parts of the chassis are fitted with patent oil-less bearings, which need no lubrication whatever. The bevel drive is totally enclosed and runs in oil, and is provided with extra large ball bearings throughout. The rear wheel is easily detachable by use of a single spanner, and is interchangeable with the front wheels, a distinction which the Castle shares with very few other makes of three-wheelers of its type. Artillery wheels are fitted.

Stand **SCOTT SOCIABLE.**

19. The Scott Sociable was fully described in a recent issue of *The Motor Cycle*, and no doubt readers who visit the Show will make a point of inspecting it in its finished form. As is well known, the machine is a three-wheeler, which represents a development of sidecar construction,



Chassis of one of the most remarkable little three-wheelers extant—the Scott Sociable.



The T.B. has a V-twin engine and shaft drive.

inasmuch as there are two tracks, and the side and rear wheels are in line. A two-cylinder two-stroke rotary valve water-cooled engine of 578 c.c. is fitted, and a crank case extension contains a constant mesh three-speed gear box, from which the drive to the off side rear wheel is taken by shaft and bevel. A self-contained starting device, operated from the driver's seat, is contained in the crank case, and the whole power unit with its controls complete may be removed from the chassis by undoing four bolts. One unusual feature of the Scott Sociable engine is the double-pole system of ignition. This is a method with which the designer gained much experience in past T.T. races, and the lessons there gained have resulted in the design of a special two-pole plug, which is used in conjunction with a sparking plug of standard pattern. An M-L magneto provides the spark, and this is equipped with the "impulse starter" produced by the makers of this type; the device greatly facilitates the starting of the engine. It is noteworthy that all ordinary adjustments to the engine may be carried out by the driver without him leaving his seat. The chassis construction is unusual, since no brazed joints are used, all the members throughout being tubular units of standard lengths. The bodywork completely encloses the chassis, and the engine is entirely concealed from view. Detachable and interchangeable wheels are fitted, and the body provides ample accommodation for two people, with an additional dickey seat at the back. A special feature of the Sociable design is its extreme mobility; it can be turned in its own length.

Stand **L.S.D.**

40. A soundly constructed three-wheeler, the L.S.D. has an 8 h.p. J.A.P. air-cooled engine, and two speeds and reverse. The transmission is by shaft and chain, and the wheels are of artillery type. This little vehicle made its appearance first at the last Show, and has not undergone any drastic alterations. Its manufacturers are Sykes and Sugden, Ltd., Huddersfield, and as their works are situated in a district which is notorious for a combination of difficult hills and inferior road surfaces it may be assumed that the machines are designed to withstand, and are tested under the most arduous conditions. The staunch appearance of the car bears out this assumption.

International Trials.

The Work of the F.I.C.M.

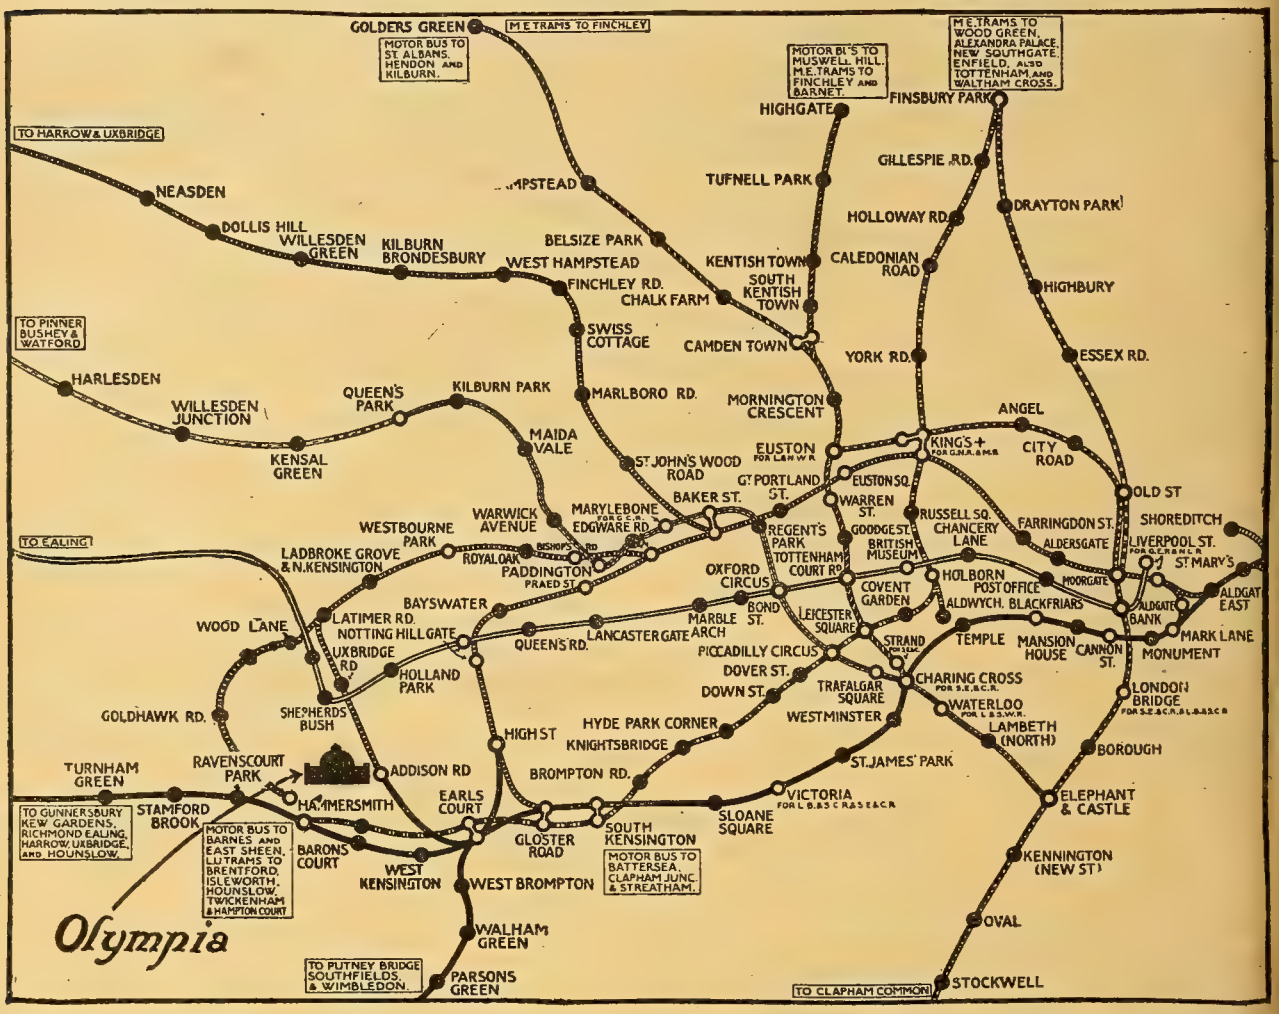
ON a recent occasion the Spanish Royal Automobile Club was approached by a Paris motor cycle paper, requesting the King of Spain to give a cup for projected trial from Paris to Madrid arly next year. The Real Automobil lub d'España then wrote to the Secretary of the International Federation of otorcyclists, asking for information on e subject, and whether there was any uarantee that the trial would be roperly organised. The F.I.C.M. therefore communicated with responsible ersons in the country concerned—in this se the Union Motocycliste de France—ho disclaimed all knowledge of the proposed trial, and could not offer any guarantee as to how it would be organised. This is but a small example of the value of the work of the F.I.C.M., who were thus able to prevent the offer of a valuable trophy for a competition which might have proved a fiasco.

It has also come to the knowledge of the International Federation of Motorcyclists that a suggestion had been put forward for holding the Paris-Nice trial again next year. The U.M.F. were interrogated, and replied that they would not give a permit for this event unless they had very certain guarantees that the competition would be organised in such a manner as to bring no discredit on the motor cycling movement.

The position regarding Spain is quite interesting. Motor cycling has prospered in that country, but there has been no body to rule the sport. There were two successful motor cycle clubs in Spain, between which a certain amount of rivalry existed, and for a long time the R.A.C.E. could not come to a satisfactory arrangement. We are glad, however, to state that the rival clubs have now been amalgamated, which has resulted in the formation of the Real Moto-Club d'España, which now governs motor cycle sport in Spain.

HOW TO GET TO OLYMPIA.

Map and Table of Underground and Motor Omnibus Routes from Principal London Termini.



THE following information may be of service to those of our readers who do not know their way about London, and clearly shows how Olympia may be reached by underground railway or by motor omnibus from the principal London termini.

BAKER STREET. Inner Circle train to High Street, Kensington; and thence by 'bus to Olympia—Nos. 9 and 33.

BROAD STREET. Inner Circle train from Liverpool Street Underground to High Street, Kensington; thence by 'bus to Olympia—Nos. 9 and 33.

CANNON STREET. Inner Circle train to High Street, Kensington; thence by 'bus to Olympia—Nos. 9 and 33.

CHARING CROSS. Inner Circle train to High Street, Kensington; thence by 'bus to Olympia—Nos. 9 and 33.

EUSTON. Euston Square Underground (Inner Circle, to High Street, Kensington; thence by 'bus to Olympia—Nos. 9 and 33.

FENCHURCH STREET. Mark Lane Station (5 mins. walk); Circle train to High Street, Kensington; and thence by 'bus to Olympia—Nos. 9 and 33.

KING'S CROSS. King's Cross Underground; Inner Circle train to High Street, Kensington; thence by 'bus to Olympia—Nos. 9 and 33.

LIVERPOOL STREET. Liverpool Street Underground; Inner Circle train to High Street, Kensington; thence by 'bus to Olympia—Nos. 9 and 33.

LONDON BRIDGE. Walk or 'bus to Monument Underground station; Inner Circle train to High Street, Kensington; thence by 'bus to Olympia—Nos. 9 and 33.

MARYLEBONE. Edgware Road Underground station; Circle train to High Street, Kensington; thence by 'bus to Olympia—Nos. 9 and 33.

PADDINGTON. Paddington Underground to High Street, Kensington; thence by 'bus to Olympia—Nos. 9 and 33.

ST. PANCRAS. See King's Cross.

ST. PAUL'S. Blackfriars Underground; Circle train to High Street; thence by 'bus to Olympia—Nos. 9 and 33.

VICTORIA. Victoria Underground; Circle train to High Street; thence by 'bus to Olympia—Nos. 9 and 33.

WATERLOO. By Bakerloo to Charing Cross; Circle train to High Street; thence by 'bus to Olympia—Nos. 9 and 33.

Connected with the District Railway at Earl's Court there is a train running to Addison Road Station, just outside Olympia. This line is also directly connected with Willesden Junction, on the North-Western Railway.

Those visitors who desire to travel above ground may find the following list of omnibus routes from the main London termini to be useful :

BAKER STREET (Metropolitan Ry.). 'Bus service No. 27—Highgate to Twickenham.

BROAD STREET (L. & N.W. Ry.). No. 9—Liverpool Street and Barnes.

CANNON STREET (S.E. & C. Ry.). No. 13—London Bridge and Hendon to Piccadilly Circus; thence by No. 9—Liverpool Street and Barnes; or No. 33—Charing Cross and Richmond.

CHARING CROSS (S.E. & C. Ry.). No. 33—Charing Cross and Richmond; No. 9—Liverpool Street and Barnes.

EUSTON (L. & N.W. Ry.). No. 73—Stoke Newington and Richmond.

FENCHURCH STREET (L.T. & S. & G.E. Rys.). No. 23—Leadenhall Street to Oxford Circus; thence by No. 73.

KING'S CROSS (G.N. Ry.). No. 73—Stoke Newington and Richmond.

LIVERPOOL STREET (G.E. Ry.). No. 9—Liverpool Street and Barnes.

LONDON BRIDGE (L.B. & S.C. & S.E. & C. Rys.). No. 13—London Bridge and Hendon; or 13a—London Bridge and Southfields, Hampstead to Piccadilly Circus; thence by No. 9—Liverpool Street and Barnes; or No. 33—Charing Cross and Richmond.

MARYLEBONE (G.C. Ry.). No. 27—Highgate and Twickenham.

PADDINGTON (G.W. Ry.). No. 27—Highgate and Twickenham.

VICTORIA (L.B. & S.C. & S.E. & C. Rys.). No. 16—Victoria and Cricklewood; or No. 2—Victoria and Seven Kings; or No. 38—Victoria and Walthamstow to Hyde Park Corner; thence by No. 9—Liverpool Street and Barnes; or No. 33—Charing Cross and Richmond; or No. 73—Stoke Newington and Richmond.

WATERLOO (L. & S.W. Ry.). No. 1a—London Bridge and Hendon; or No. 68—Chalk Farm and Tulse Hill to Strand; thence by No. 9—Liverpool Street and Barnes.

B·S·A at Olympia

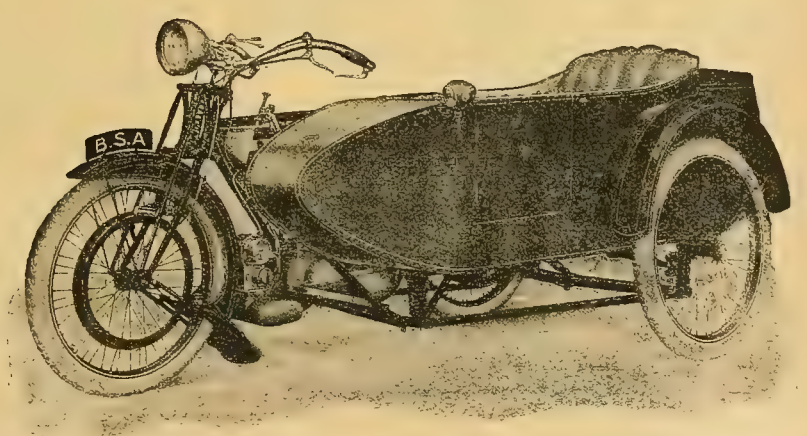
Nov. 29th –Dec. 4th

New Engine Detail and Sidecar

form the chief alterations on the famous B.S.A. 4¼ h.p. Model. The various new features further enhance the efficiency of the famous B.S.A. 4¼ h.p. Model, which, it will be remembered, won the Team Prize in the 1919 A.C.U. and 1921 Scottish Six Days, and 5 Gold Medals with 5 entries in the 1920 A.C.U. The new B.S.A. Sidecar is of exceptionally graceful appearance, and affords the maximum of riding comfort and luggage capacity. In every detail the 1920 B.S.A. 4¼ h.p. follows out B.S.A. practice with regard to excellence of material and workmanship.

1921 B.S.A. 4¼ h.p. Motor Bicycle

For Solo and Sidecar.



Other B.S.A. Models will also be shown, including the B.S.A. 6/7 h.p. Twin.

THE 3½ h.p. STANDARD MODEL

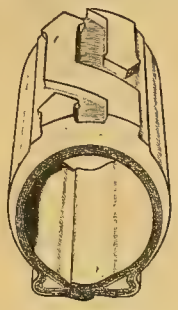
The NEWCASTLE-UPON-TYNE Motor Co., Ltd.,
St. Thomas Street,
NEWCASTLE-UPON-TYNE.

TYRES AT OLYMPIA.

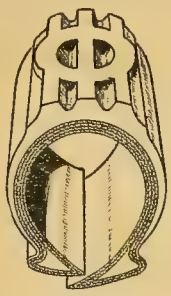
A Résumé of the Various Makers' Specialities with Illustrative Cross-sectional Diagrams.

The Dunlop rubber-studded.

The Clincher "Cross" tyre (for cycle cars).

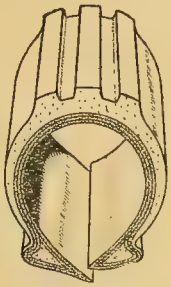


A Macintosh tread.

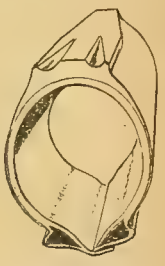


A cover by Messrs. Hutchinson.

The Kempshall anti-skid.



The grooved tread Midland.



The Moseley heavy arrow pattern cover.

THE number of makes, types, and patterns of outer covers to be seen at the 1920 Motor Cycle Show will be considerable, and a study of them will reveal the ingenuity displayed by many of the designers in attempting to obtain an effective non-skid pattern. Of late years considerable improvement has been effected in tyre construction, with the result that better wearing qualities have been obtained, and naturally a greater freedom from punctures. In the case of motor cycles, as with cars, the tendency is to fit as large tyres as possible.

Avon.

THE AVON INDIA RUBBER CO., LTD. (Stand No. 133, Annexe.)—The Avon tyre must always be remembered by the numerous successes gained during the past season, including twenty-six cups and trophies, a hundred and fifteen gold medals, and numerous other awards, to say nothing of numerous records at Brooklands. The covers are made to the correct size, and have been improved in manufacture. All treads are now produced from a new black rubber, which is more resilient than the former grey mixture. Avon tyres are not only better in quality, but cheaper in price for the coming season. The two models which specially appeal to us are the Avon extra heavy three-ribbed cover, in which the ribs have themselves a series of indentations, and the heavy three-ribbed pattern, which follows standard practice in the design of its tread.

Bates.

MESSRS. W. AND A. BATES, LTD. (Stand 134, Ground Floor.)—The Bates all-weather tyre has been specially designed for high-powered and passenger machines. The design of tread is unconventional and ingenious, and it should prove an efficient non-skid. It is interesting to record that Bates tyres are moulded in the inflated shape, and are vulcanised under the tremendous pressure of over half a ton to the square inch, consequently the tyres are extremely difficult to puncture, and if cut the edges tend to close.

Beldam.

THE BELDAM TYRE CO., LTD. (Stand No. 82.)—Beldam tyres have long been known for their excellent quality and hard-wearing properties. The pattern illustrated is known as the V tyre. It has a flat tread with V shaped indentations and a transverse groove between each indentation. The flexible rubber V's not only take up circumferential slip, but also prevent skidding, while they support the machine when a corner is negotiated. It is also claimed that with this tyre punctures are reduced to a minimum

Clincher.

THE NORTH BRITISH RUBBER CO., LTD. (Stand No. 79.)—A novel pattern exhibited by this firm is the Clincher Cross tyre, suitable for Morgans, Blériots, and other cycle cars. It is made in the 700 mm. × 80 mm. size to fit 650 mm. × 65 mm. rims. One of the most popular patterns of the motor cycle tyres is the three-ribbed Dreadnought, which is not only strongly constructed, but is also resilient. It is also made in the stud and bar pattern.

Clipper.

THE CLIPPER TYRE CO., LTD. (Stand No. 53.)—The Reflex Clipper Ideal is specially constructed for high-powered machines; the Clipper rubber-studded is a lighter tyre, sold at a moderate price, and is suitable for machines of moderate horse-power.

Dunlop.

THE DUNLOP RUBBER CO., LTD. (Stand No. 77.)—The famous house of Dunlop will be exhibiting a full range of motor cycle tyres, including three grades of rubber-studded covers for machines of varying horse powers. The most interesting exhibit on this stand will be the Dunlop Magnum tyre, made in British standard sizes to fit British standard rims. It is a motor cycle tyre constructed on car lines. Practically no alteration has been made in the design of these tyres for the coming season.

Goodrich.

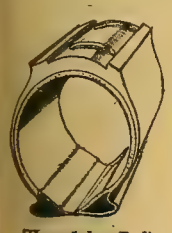
THE B. F. GOODRICH CO., LTD. (Stand No. 109.)—The B. F. Goodrich Co. is another firm constructing a motor cycle tyre on car lines. Like the larger car tyre it is fitted with a safety tread consisting of two groups of three lozenges interrupted by transverse oval bars. Its makers claim it to be the strongest tyre on the market, and state that it is highly suitable for sidecar work.

Hermetic.

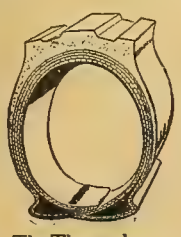
THE SELF-SEALING RUBBER CO., LTD. (Stand No. 136.)—The company are marketing two types of motor cycle covers. The type F, suitable for machines of moderate horse-power, may be had with wired or beaded edges. It is, however, the type Z in which the company are specialising. The casing is composed of four-ply canvas, while the zigzag pattern rubber tread with longitudinal ribs running each side of the centre pattern has four plies of canvas. The tread is exceptionally thick, and of excellent quality.

Hutchinson.

THE HUTCHINSON TYRE CO., LTD. (Stand No. 107.)—A new pattern Hutchinson tyre will be shown in which

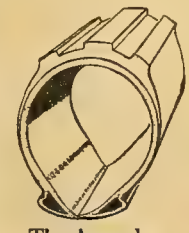


The John Bull cross-groove cover.

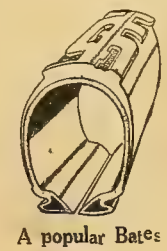


The Thames heavy cover.

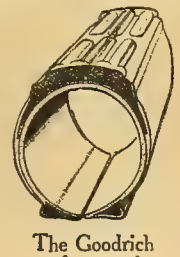
The Avon extra heavy three-ribbed.



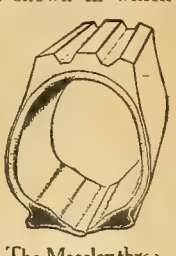
The Avon heavy three-ribbed.



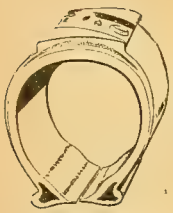
A popular Bates cover.



The Goodrich safety tread.

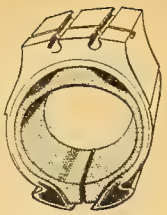


The Moseley three-ribbed.

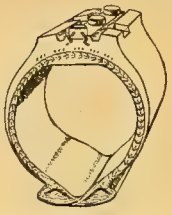


The Rom combination cover.

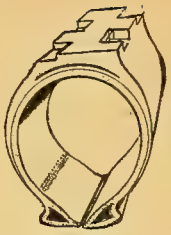
The "V" Beldam tyre.



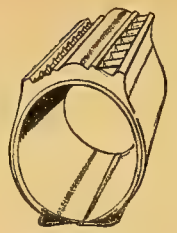
The Rapson tyre.



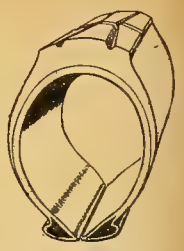
The Palmer steel-studded tyre.



The Richmond.



The Alfred Roberts.



The Rom tyre.

the principle is followed of putting the main portion of the tread into the studs, so that it retains its non-skidding qualities practically throughout its whole life. Another new pattern will be of the three-ribbed variety, but with rings moulded between the ribs. This increases the surface and prevents rolling, and is invaluable for heavy motor cycles and cycle cars. Quite a new pattern introduced for 1921 by the Etablissements Hutchinson is a tread consisting of three rows of rubber studs, of which the studs in the centre row alternate with lozenges.

John Bull.

THE LEICESTER RUBBER CO., LTD. (Stand No. 80.)—The section shown of the ribbed stud cover is one of the 28×3in. sizes. Being a combination of the ribbed and studded patterns, it is a non-skid in all directions, and should neither roll nor skid. Another pattern is the John Bull cross-groove cover, consisting of two longitudinal ribs, between which are transverse grooves. This is one of the company's oldest patterns.

Kempshall.

THE KEMPSHALL TYRE CO. (OF EUROPE), LTD. (Stand No. 104.)—The popular Kempshall will be shown in two patterns—the famous non-skid model, so constructed that the buttresses moulded against the tread present additional radiating surface which helps to keep the cover cool, and the ingenious and unique heavy anti-skid pattern, combining the qualities of a ribbed and studded tyre.

Macintosh.

MESSRS. CHAS. MACINTOSH AND CO., LTD. (Stand No. 64.)—Messrs. Chas. Macintosh and Co. will be showing two patterns—the extra heavy moulded non-skid, which has staggered longitudinal indentations round the exterior of the tread, and the heavy non-skid, the tread of which is of peculiar design and, we are informed, most effective against skidding even long after the centre portion of the tread has been worn, as the exterior of the pattern then comes into contact with the road.

Midland.

THE MIDLAND RUBBER CO., LTD. (Stand No. 83.)—The Midland Rubber Co. specialise chiefly in a plain three-ribbed cover of conventional design.

Max.

MESSRS. CHAS. L. CUTHBE. (Stand No. 135A.)—The Max Cycar tyre is built entirely on car lines. The tread is of registered design, and consists of longitudinal ribs, between which are lozenge-shaped studs. Another tyre is known as the Max End-to-end tyre, which has met with considerable success during the past season.

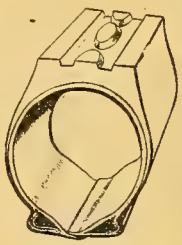
Moseley.

MESSRS. DAVID MOSELEY AND SONS, LTD. (Stand No. 52.)—The three patterns of tyres to be exhibited by Messrs. David Moseley and Sons will be the heavy arrow pattern, provided with an arrow-shaped tread of white rubber; another pattern is of the three-ribbed variety and composed of dark rubber, which is designed for both heavy and mediumweight machines.

Pedley.

MESSRS. JOHN PEDLEY AND SON, LTD. (Stand No. 132.)—Two patterns of treads are being shown by this firm—the rubber-studded variety and the three-ribbed pattern, the latter for heavyweight motor cycles, while the former is for lighter machines.

The Pedley heavy-weight beaded edge pattern.

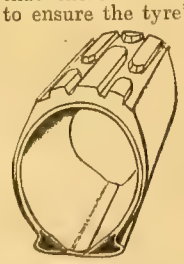


The Cuthbe Max cover.

Richmond and Rapson.

MESSRS. OYLERS, LTD. (Stand No. 108.)—The Richmond heavy tread non-skid tyre, which will be shown by this firm, has been specially constructed to withstand the stresses present on the rear wheels of heavy motor cycles, while the Richmond heavy round non-skid tyre has been designed for the front wheels of heavy machines, and is also an excellent all-round cover for lightweight motor cycles.

The Rapson motor cycle tyre will make its appearance on this stand. As our readers are probably aware, this tyre is claimed to be unpuncturable, and yet to retain all the resiliency of an ordinary pneumatic tyre. It has a substantial all-rubber non-skid tread, while inside is an inner casing of soft resilient rubber, while the top of this is so constructed that there are air spaces so as further to ensure the tyre's resiliency.



The John Bull rib stud cover.

The Hermetic Peerless, type Z.

Palmer.

THE PALMER TYRE, LTD. (Stand No. 106.)—The Palmer exhibit will consist of tyres of various grades and sizes suitable for all types of machines. There will be the two-ply pattern, Palmer Cord motor cycle tyres, and the heavy and extra heavy patterns. Mention must also be made of the Palmer combination tread, which is made in the 700×75 mm. size to fit 650×65 mm. rims. It is of the interrupted three-ribbed pattern with steel studs anchored to the centre rib.

Roberts.

MESSRS. ALFRED ROBERTS AND SONS, LTD. (Stand No. 81.)—The Roberts motor cycle tyre possesses a peculiar and distinctive pattern. Being moulded under great pressure, the rubber is rendered very compact, and consequently presents a heavy resistance to cuts. The peculiar design of the tread renders it an effective non-skid.

R.O.M.

THE ROM TYRE AND RUBBER CO., LTD. (Stand No. 110.)—In addition to their combination cover, which was the first of its kind to be placed on the British market, and is most effective for the driving wheels of sidecar outfits, three-wheelers, and other light cars, the company are now placing on the market an all-rubber non-skid of original design. The tread is so intersected by grooves that large hexagonal studs are formed, projecting three-sixteenths of an inch above the tread.

Thames.

THE THAMES RUBBER CO., LTD. (Stand No. 105.)—The Thames Rubber Co. are specialising in a three-ribbed cover of pleasing design, which they will be showing in addition to the Rich open-ended detachable inner tube, which has long been one of the most practical of its kind on the market.

Wood-Milne.

WOOD-MILNE, LTD. (Stand No. 78.)—The Wood-Milne tyre has long been known to motor cyclists as a practical article. The most popular model is known as the Key-Grip, the substantial tread of which consists of staggered indentations which give it an excellent grip of the road.

The Wood-Milne tyre.

The Pedley rubber-studded.

The New ROVER Cycle Co., Ltd.,
COVENTRY.

In answering this advertisement it is desirable to mention "The Motor Cycle."

WHAT SHALL IT BE?

Some Notes on the Selection of a Motor Cycle.

THIS article is one which is not intended to appeal to the experienced motor cyclist.

The man who has had one or two machines of his own should not need to be told what would suit him best, but the prospective motor cyclist with no previous knowledge of the subject stands in a different case. Such a one taking up a copy of *The Motor Cycle* and glancing through its advertisements, or looking through the Show report, is bewildered by the claims of a hundred and one machines, all of which might or might not answer his requirements. In short, he does not know what to choose while, if he actually visits Olympia, his troubles may be further increased by the over-enthusiasm of the bright young men who grace the stands, and who are boiling over with zeal and modern methods of salesmanship.

Let Requirements Dictate.

Before embarking upon the purchase of a machine it is necessary to examine very closely, and to anticipate, the uses to which it will be put. For example, the man who has ambitions to cut a dash amongst the local sporting fraternity by establishing new figures for the "unlimited" flying half-mile in his club trials is wasting his money if he invests in certain classes of lightweight two-strokes; in the same way the business man who wishes to make his calls by the aid of a motor cycle would be foolish to purchase an 8 h.p. speed model.

Machines for All Purposes.

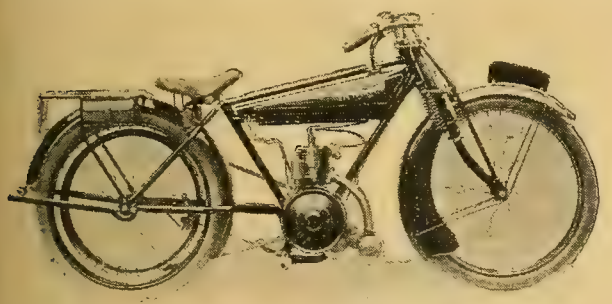
At the present time there are machines on the market which will answer every requirement; by that we do not mean that every requirement can be met by one machine, but for each class of service there are certain types which are most suited. To help the beginner in his understanding of these is our task.

First of all, let us take the solo machines and the class of use to which they are subjected. The lightweight type, for instance, is largely employed for short distance work and about-town riding—in short, all that kind of use which is termed "pottering." Nevertheless, it must not be assumed that the lightweight solo machine is totally unsuitable for serious touring purposes, since most of the leading makes of lightweight machines have shown themselves capable of surviving a Six Days Trial. For short distance work generally, a single-geared two-stroke of about 2½ h.p. will answer most requirements, especially in the moderately flat undulating districts. If, however, severe hills have to be climbed and much traffic negotiated, the advantages of a two-speed gear and clutch are so great as to be not only desirable, but almost essential.

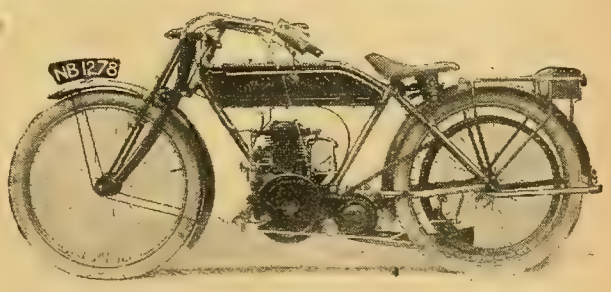
Medium Weight for Comfort.

To those whose ambitions or business lead them further afield, a machine of greater power and weight than those in the pure lightweight class may be desirable: it is much less fatiguing to ride long distances over an engine which, by reason of increased capacity, may be geared higher, and thus be less "fussy" in the performance of its duty. The medium weight 3½ h.p. to 4¼ h.p. single, and the twin-cylinder machines of corresponding power, are ideal for the class of rider who undertakes long journeys, and has a moderate amount of luggage to transport.

The final class of solo machine is the speed mount pure and simple. This type is dying a natural death, since the 1920 T.T. races and Brooklands records all



The single speed lightweight represents the extreme end of the scale so far as minimum weight and complication are concerned; the ideal type for young people, short business calls, and general "runabout" work.



A development of the lightweight; a 350 c.c. two-stroke with two-speed gear, clutch, and kick-starter. This class of machine is becoming more and more popular, for it is capable of almost any service as a solo machine, and it *will* take a light sidecar.

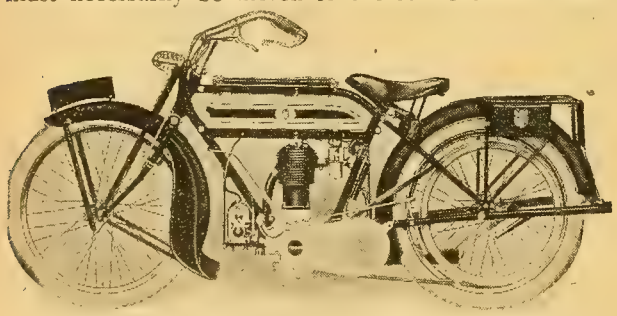
What shall it be?—

go to prove that the speed of a standard touring machine with three-speed gear and chain drive cannot be excelled by the old type of fixed gear machine which was once favoured. However, for a certain type of rider, the old style of direct driven sporting solo machine still has its attractions, and the man who only rides for pleasure and leaves his machine at home when weather conditions are unfavourable will find that there are still a number of makers who cater for his needs.

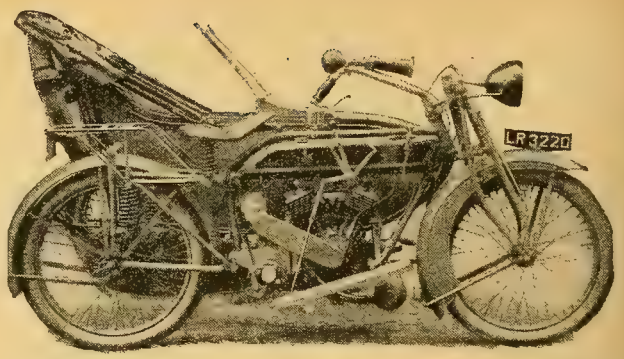
Passenger Machines.

Undoubtedly the passenger machine has become the most popular type of motor cycle on the road, and probably two out of every three motor cyclists purchase machines with a view to sharing their pleasures with someone else. Those who have only an ultra-light and low powered solo machine will find it impossible to use a sidecar, and if they wish to take a companion on their runs must adopt the pillion seat, which method does not provide a permanent, go-anywhere type of transport for two people. In consequence the sidecar has achieved an enormous success, and its numbers are legion.

To those whose normal riding does not include any more serious hills than are found in the Midlands and Southern Counties, a 350 c.c. two-stroke machine of substantial frame design and suitably geared will perform wonders with a light sidecar, but as small engines must necessarily be driven to the full extent of their power in order to maintain decent average speeds, it is important that users should realise the decided limitations of miniature outfits. The man who wishes to take out his family, for instance, should not consider any machine of less than 4 h.p., since the use of a large and roomy sidecar, with perhaps an additional passenger on the carrier, makes very serious demands upon the engine, especially if hill-climbing has to be done, or a long run carried out against a strong head wind. The difference between the 4 h.p. type of single-cylinder sidecar machine and the 6 or 8 h.p. twin-cylinder outfits is mainly one of speed and refinement of fittings. The 8 h.p. machine, for instance, with its large reserve of power, may be equipped with all the luxuries which the mind of the rider or his passenger may imagine, but to load a lower powered machine with the same weight would be disastrous to its performances. It should be understood, therefore, that the only difference between the two types lies ultimately in the average speed which it is possible to maintain with them. In the hands of a careful driver the medium weight single-cylinder outfit will answer every requirement of the tourist, the family man, or the tradesman who needs a staunch and reliable vehicle for pleasure or business purposes; that this is so is amply proved by the overwhelming number of machines of this type which are to be seen on the roads to-day.



Motor cycles as a whole owe their popularity to this type of machine—the double-purpose mediumweight. The solo mount *par excellence*, and capable of touring the length and breadth of the land with a sidecar, its service is that of the willing hack.



To the man who insists on travelling *en famille*, or who wants every refinement for his passenger and the speed of a car, the 8 h.p. outfit is the only possible solution. Lower powers may do the work, but the owners always sigh for bigger engines.

"A Rag-bag of Recollections."

"Ixion's" Reminiscences of Motor Cycling from Earliest Days.

"IXION" has not disappointed us. Our appetites whetted by an extract published in these pages some months ago, and by regular weekly perusal of his incomparable Comments, we motor cyclists have awaited his reminiscences as breathlessly (if not as fearfully) as did the politicians await Margot's revelations.

Essentially readable, they are yet extremely informative, containing as they do a complete *résumé* of the motor cycling movement almost from its birth, and breathing the early atmosphere—sadly changed nowadays—of enthusiasm battling against innumerable prejudices.

As a humorist, "Ixion" reveals another side of his many-phased talent, occasionally indicated to his Comments' acquaintances. It is usual, and would be justifiable to claim an inability to close such literature before reaching *finis*, however late the hour. Establishing a precedent, we confess that the call of the blankets proved too strong; but next morning, relegating Teddy Tail for later reference, our explosive chuckles required careful timing between gulps of breakfast coffee to avoid disaster.

And should his early misfortunes tend to deter the outsider from the pastime, his concluding chapter on the pleasures of motor cycling is so attractive as to cause an immediate boom on its own.

"My Motor Cycle Reminiscences" is published by Iliffe and Sons Ltd., 20, Tudor St., E.C.4, at 5s., by post 5s. 3d.

DUNELT
TWO-STROKE

4½ h.p. Single Cylinder Motor Cycle

When visiting the OLYMPIA SHOW make a note to call at STAND No. 138 and see the "DUNELT" Two-Stroke—examine it thoroughly—note its original design, sound construction and special points of superiority—and you will readily admit that it stands in a "class of its own."

Note its Specification

ENGINE. Patent 4½ h.p. single cylinder two-stroke, air-cooled, 85 mm. bore × 88 stroke, 500 .c.c.

FRAME. Specially designed strong section loop frame, with straight dropped top tube, giving low saddle position. The lugs are heavily reinforced throughout where the maximum strain occurs, thus ensuring an almost unbreakable frame. Front and back stands fitted.

MAGNETO. M-L. CARBURETTER. Cox Atmos.

SPRING FORKS. Laminated spring, specially designed to absorb vertical and horizontal shocks.

LUBRICATION. Best & Lloyd drip feed to cylinder walls.

GEAR. Sturmey-Archer three speed and clutch.

TRANSMISSION. ⅝" roller chain to gear and 1" belt to back wheel.

TANK. Capacity, 2½ gallons petrol, 3 pints oil.

WHEELS. 26" × 2½", easily detachable, and interchangeable throughout. "Knock-out" spindles. Improved aluminium footboard and rest combined. Ground clearance 6".

BRAKES. Specially designed front and rear brakes, operating on belt rim. Wheels can be removed without interfering with brakes.

MUDGUARDS. 6" wide, giving ample protection in all weathers.

SADDLE. X-L-ALL. TYRES. Hutchinson Heavy, 26" × 2½".

COMBINATION. Specially designed "Watsonian" sidecar, allowing interchangeability of wheels, complete with apron and spare wheel.

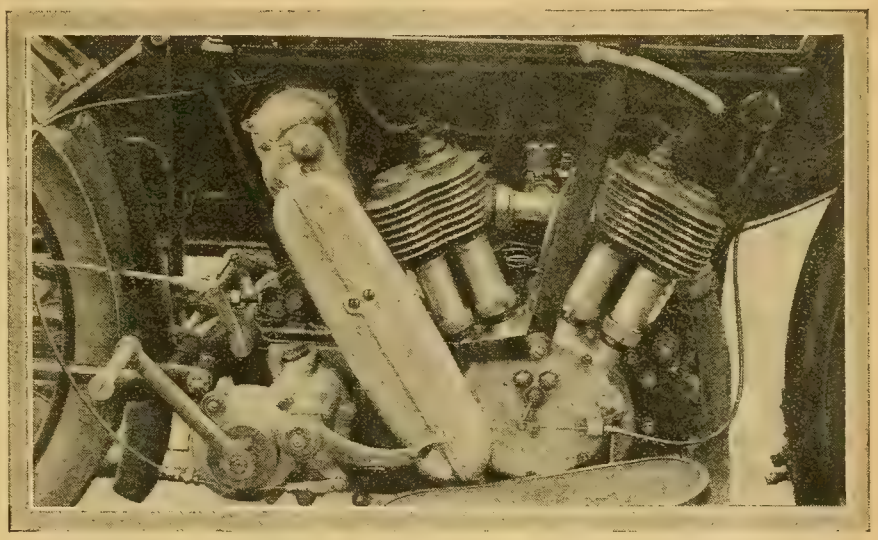
NEW AND IMPROVED MODELS.

A HIGHER POWERED JAMES SIDECAR OUTFIT.

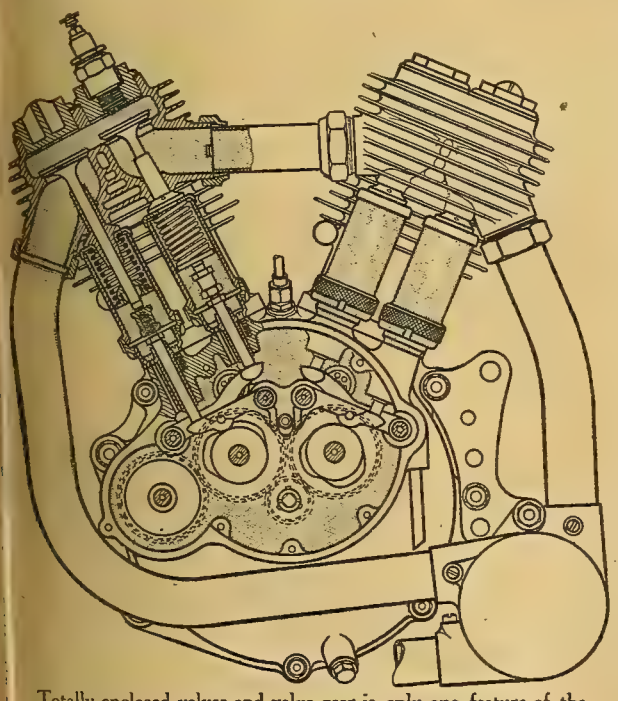
All External Moving Parts Completely Enclosed in the New 7 h.p. V Twin Engine

WHEN the recent extensive fire at the James Works is recalled, one would be inclined to pardon the James Cycle Co., Ltd., if they, like so many other firms, had rested upon their laurels this year and retained unaltered the highly successful 5-6 h.p. twin as their big passenger machine. Therefore we congratulate them on the production, necessarily under difficulties, of a new 7 h.p. twin sidecar outfit.

A fine example of its type, the engine is of strikingly clean external design. Conventional otherwise, the latter feature is gained by an entire absence of nooks and crannies in its crank case and valve-gear cover, and by the adaption of quite the neatest valve-spring covers we have seen. These latter are of aluminium, cylindrical in shape and instantly detachable on a split bush and taper principle. Provision is made for lubricating the valves and for allowing surplus oil to return to the crank case. The 73×89.5 mm. cylinders give a total capacity of 749 c.c., and the makers rate this, their No. 10 model, at 7 h.p., a figure we have no doubt it greatly exceeds in practice.



Very clean external design is a commendable feature of the 7 h.p. twin James engine. Note the valve covers.



Totally enclosed valves and valve gear is only one feature of the new 7 h.p. twin engine, here shown in part section.

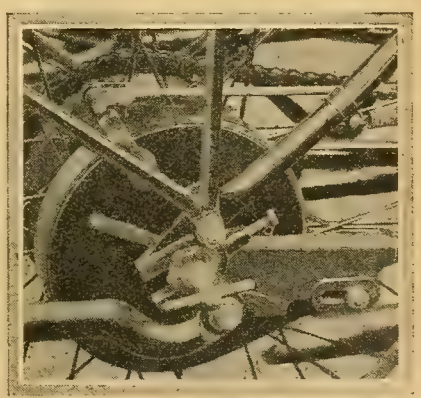
Although of exactly similar action to last year's model, the gear box and kick-starter have been considerably strengthened, an improvement which in the Six Days Trial and subsequent tests proved to exceed all expectations.

The internal expanding rear brake has also been redesigned on a larger and stronger basis; and the rear wheel is now quickly detachable whilst leaving the transmission and cases *in situ*. However, the brake drum comes away with the wheel, thus necessitating (an unusual feature) the spare wheel carrying a complete spare brake as well. By periodically changing wheels the user may thus keep his tyres and brakes in A1 condition.

Additional comfort for the rider is provided by a specially adapted type of Lycett pan saddle, which is suspended in front by an extended leaf spring pivoted well forward on the top tube.

Included in the complete specification is a handsome and roomy sidecar to the body of which is attached a strong luggage grid.

This model replaces the 5-6 h.p. machine; and the remainder of the James range is unaltered.



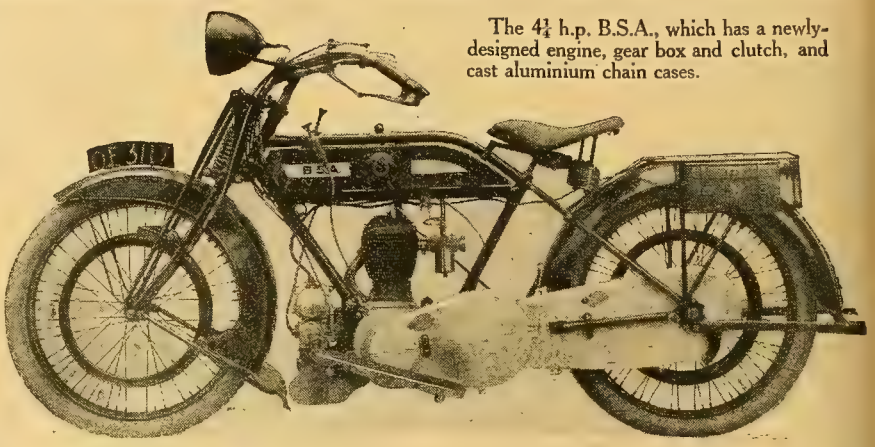
The internal expanding brake on the James sidecar machine is removed with the quickly detachable wheel.

Three B.S.A. Models for 1921.

A New 4¼ h.p. Engine, Re-designed Transmission, and All-chain or Chain and Belt Drive.

SILENCE and serviceability are obviously the watchwords of the B.S.A. Co. in introducing their new 4¼ h.p. motor cycle. Reliability and a capacity for hard work have long been associated with the firm's productions, and the regular performances of these machines in all the big reliability trials are now taken as a matter of course.

Though the general layout of the new models follows standard B.S.A. practice and embodies all the well-known features, two points have received very special attention in the redesigned machine. First, the question of silence has been carefully studied, and external cams mounted on a common shaft and operating the tappets through long rockers are now employed, and the whole of the valve gear is most carefully manufactured. The new cam gear has obviously been designed with a view to silent action, and a large silencer is also fitted, which, in conjunction with a long tail pipe, reduces exhaust noise to a minimum without causing any appreciable back pressure, since no baffles are used.



The 4¼ h.p. B.S.A., which has a newly-designed engine, gear box and clutch, and cast aluminium chain cases.

A Much Desired Improvement.

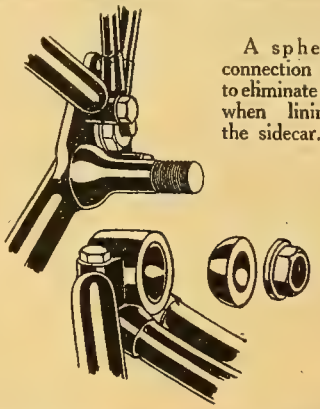
The second point consists of a very considerable improvement in the controllability of the machine, brought about by shifting the clutch to the primary shaft of the gear box. The clutch is also fitted with a handle-bar control.

With the exception of the timing gear already mentioned, the engine has been altered comparatively little. An improvement has been made in the shape of the combustion head and valve ports; the interchangeable valves are made of a chromium steel in order to prevent breakage and pitting, and easily adjusted tappets are fitted.

A slight offset of the cylinder centre minimises the wear on the cylinder walls during the power stroke. The crankshaft is carried in extra large ball bearings, while the connecting rod has a caged roller bearing big end.

A very simple form of decompressor, acting on the exhaust valve, facilitates starting; the kick-starter mechanism is now entirely enclosed in the gear box.

The well-known B.S.A. spring shock absorber is mounted on the engine-shaft,

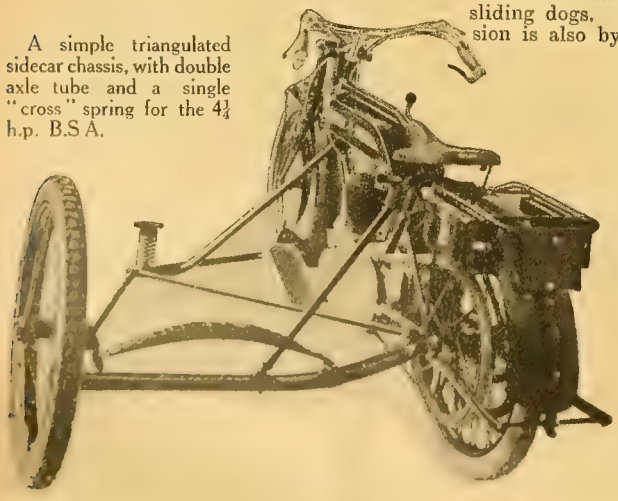


A spherical connection helps to eliminate strains when lining up the sidecar.

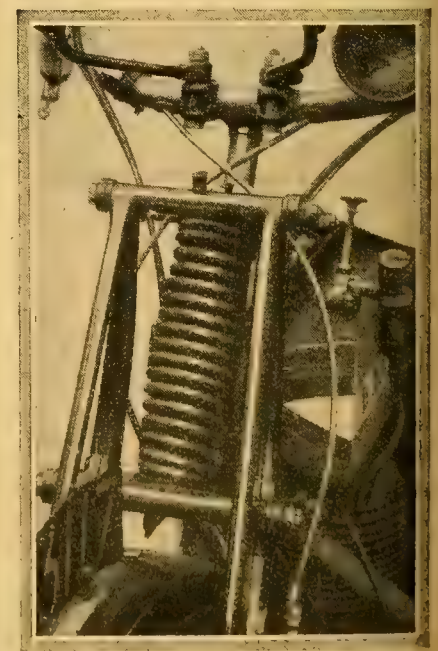
and thence a chain transmits the power to the new clutch and gear box. This clutch is of the dry plate type, having seven plates, and the gear box is similar to that of the 6 h.p. machine; that is to say, all gears are constantly in mesh, the ratio changes being effected by sliding dogs. The secondary transmission is also by chain, and both chains are entirely enclosed in oiltight, but detachable, aluminium castings. Except for the more general adoption of steel lugs, the frame has undergone but little modification; but a new spring fork is now used having one long barrel-shaped spring housed between the fork blades, and giving an exceptionally long "travel" without bumping. This fork, combined with the B.S.A. spring saddle-pillar, provides excellent insulation from road shocks. Internal V brakes are used on both front and rear wheels, the heel-operated back brake being fitted with a parallel link motion to ensure even and easy engagement.

A Serviceable Finish.

Details include 26×2½ tyres, sight feed drip lubrication, armoured tool bags and B.S.A. carburetter, while it goes without saying that the finish is superlative. It is, however, perhaps worthy of mention that fork links, springs, hubs, brake rods, etc., are heavily enamelled, thus providing a more serviceable finish than the usual mass of plated parts. For the benefit of those who still prefer "a belt somewhere in the drive"—and these are not a few—a chain and belt-driven model will be marketed, but except for the transmission the above



A simple triangulated sidecar chassis, with double axle tube and a single "cross" spring for the 4¼ h.p. B.S.A.

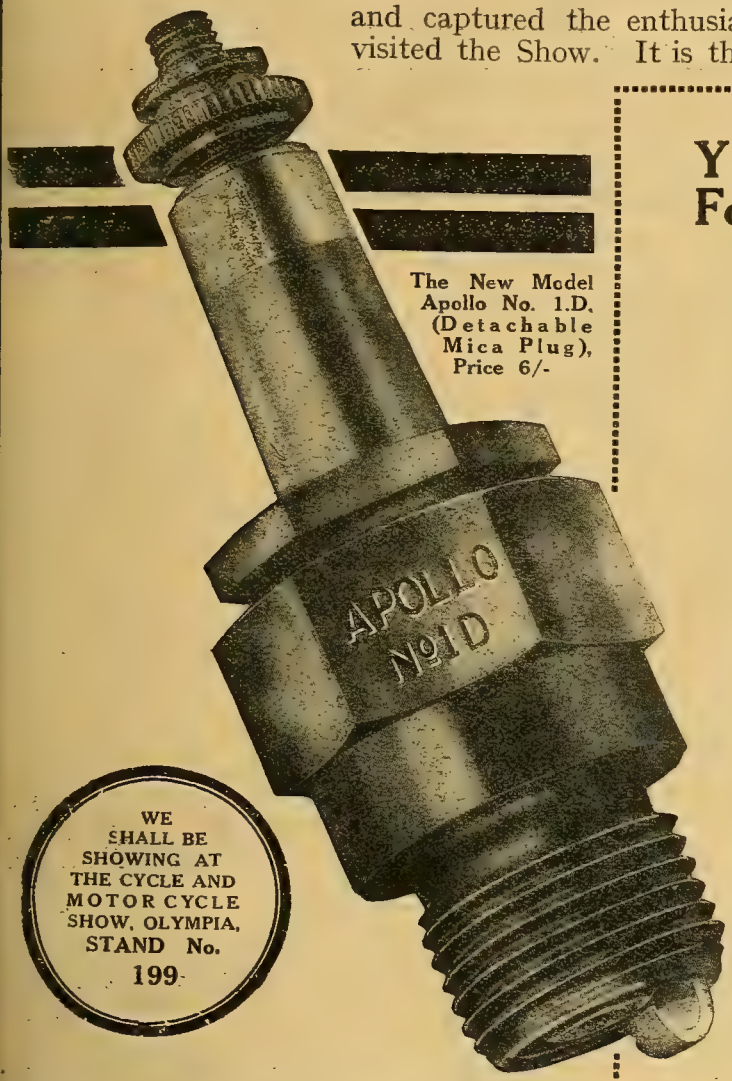


A single central fork spring and large link bearings are features of the new B.S.A. spring fork.

THIS TOOK THE-

MOTOR SHOW BY STORM

and captured the enthusiasm of the motor cyclists who visited the Show. It is the new Apollo Standard No. 1.D.



The New Model Apollo No. 1.D. (Detachable Mica Plug), Price 6/-

WE SHALL BE SHOWING AT THE CYCLE AND MOTOR CYCLE SHOW, OLYMPIA, STAND No. 199

You Can Have One For Your Engine Now

and you will be surprised at the difference you will find in the running of your machine, it's a plug that's built up to an Ideal not down to a price.

If your engine is likely to get hot, this is the plug for it, you can't soot it up! There is nothing but nickel exposed to the flame on the central electrode. This prevents pre-ignition.

The firing surface of the central electrode exposed to the flame has been reduced to a minimum. The point of heavy design is fixed to the shell, and readily disposes of heat.

NO PAINS HAVE BEEN SPARED TO ACHIEVE THE REMARKABLE RESULTS GIVEN BY THIS PLUG UNDER SPECIAL TESTS SO AS TO ENSURE THE MOTOR CYCLIST A DEGREE OF POWER HITHERTO UNKNOWN.

We are endeavouring as early as possible to meet the huge demand for this Plug; arrangements for its distribution have not yet been completed in their entirety, but should any difficulty be experienced in obtaining them through local agents, write to Apollo about it.

Do you doubt us ?

In the "IVY THREE" we have accomplished the seemingly impossible engineering feat of producing a lightweight motor cycle with its attendant low first cost and low upkeep, and yet withal having the speed and reserve power of a heavyweight listed at considerably more money and costing twice as much in upkeep. It scarcely seems credible, but read below and you will be convinced.

THE ARISTOCRAT

In answering this advertisement it is desirable to mention "The Motor Cycle."

New Models.—

description stands. Mudguarding on both types is excellent.

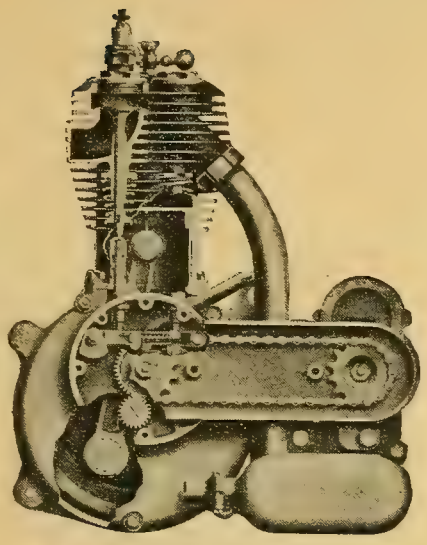
A New Sidecar.

Specially designed for the machine is a new sidecar, the chassis of which is of peculiarly simple construction. Briefly it consists of a double tubular axle member, and two side members converging forwards to form a triangle with the axle. This construction is extremely light and strong, and since it is attached to the machine by special lugs and fastenings, forms a rigid whole which cannot get out of line.

The rear attachment is formed in an ingenious manner with hemispherical seatings for the attachment, which render fitting easy and automatically take up any slight variation in centres.

Unusual Method of Springing.

Mounted on the chassis is a luxurious body with deep back and cushions, and having a locker of really useful proportions. The top of this locker is flat and acts as a platform for additional luggage. An unusual type of springing is employed, the front of the body being supported from the apex of the chassis by a single coil spring, while at the rear a single cross spring, having eleven leaves enclosed in a leather gaiter, is attached to the body in the middle, and to the double axle at either end. One end is, of course, shackled to take up the stretch of the spring.



Entirely new timing gear has been applied to the 4¼ h.p. B.S.A. for 1921. This allows a neater cover to be used,

The 6 h.p. Twin.

The 6 h.p. model, which was exhibited for the first time at the last Olympia Show, has undergone but slight modification.

Our readers will remember that this machine is fitted with a V twin engine of 76×85 mm. bore and stroke (770 c.c.), lubricated by an ingenious type of oscillating plunger oil pump. Transmission is by chain throughout, a three-speed constant mesh gear box being carried in the usual position. Both chains are entirely enclosed in aluminium castings, which, though oiltight, are easily removable. One of the most striking features of the 6 h.p. B.S.A. is the excellent mudguarding. Both guards are exceptionally wide, and enclose the forks and chain stays. For 1921 these guards have been further improved.

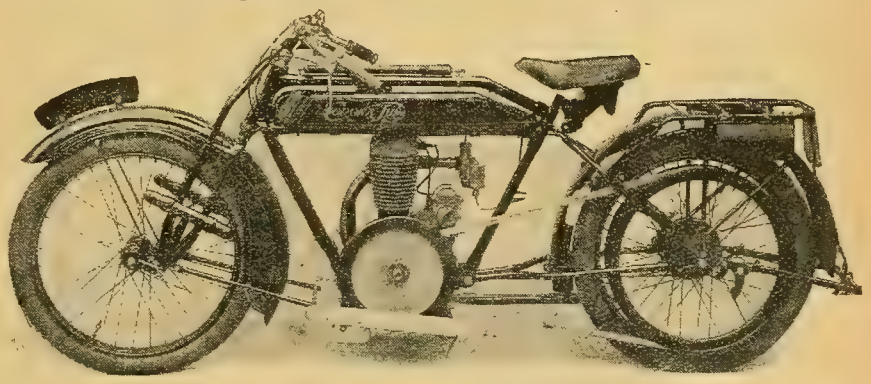
A 450 c.c. Single with Outside Flywheel.

The New Corona Junior, in which the Crank Case and Lower Part of the Cylinder are Integral.

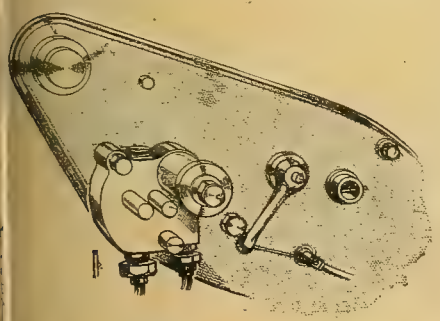
A WELL-DESIGNED machine which attracted a great deal of attention at the Motor Cycle Show last year was the Corona Junior; and, in consequence of a year's thorough testing and experiment, the new models for 1921, which have been greatly improved, should again be a centre of interest.

A feature of the power unit, it will be remembered, is the construction of the greater part of the cylinder and the crank case in one unit, whilst the detachable head, which is cast from a special heat radiating alloy, accommodates the side-by-side inlet and exhaust valves. These are inclined 5° from the vertical, the purpose of which is to enable them to be operated directly by cams made integral with the timing wheel and magneto chain sprocket. The use of rockers is therefore eliminated.

An aluminium case enclosed the valves and springs in the earlier models. This has now been removed, as in overseas climates it was found unsatisfactory. The cylinder has a bore and stroke of 72×100 mm., 450 c.c., and the magneto is accessibly mounted on a platform at the rear.



The new Corona four-stroke, now fitted with mechanical oil pump.



The mechanical oil pump and the new operating lever of the enclosed valve lifter.

An Oiling Indicator.

The oil pump, which was originally located behind the magneto chain case, is now fixed in front, and is provided with a glass tell-tale. The sump has been slightly enlarged, whilst the filler and breather are now located in front of the cylinder. A useful little device fitted to the front of the crank case enables the rider to fill the sump to the correct level. It consists of a small plug, provided with a long pin for ease of turning, which uncovers a hole, the position of which is at the correct level for the oil in the sump. The escape of oil through this hole, whilst filling up, indicates that the sump is full. An intermediate sprocket, driven by the magneto chain, operates the pump, which is of the usual gear wheel type.

An outside flywheel is used, which can be easily removed by unscrewing a lock-nut in its centre.

The crankshaft and connecting rod are dismounted by taking off the end plate on the near side of the crank case, whilst the piston can be removed after taking off the detachable head.

It is interesting that the frame lugs are made entirely of steel stampings. Another new feature is the totally enclosed exhaust valve lifter, the actuating lever of which is located on the outside of the magneto chain case.

Three models will be produced, all of which will be equipped with an acetylene lighting outfit, pump, and horn. These are the belt-driven solo machine, £97; the two-speed countershaft machine, £105; and the three-speed at £120.

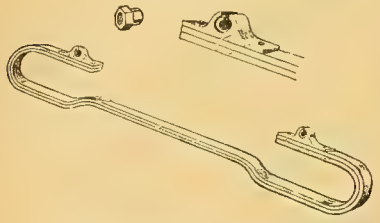
The manufacturers of the Corona motor cycles are the Meteor Manufacturing Co., Ltd., 98, Tollington Park, London, N.4.

A Luxurious Sidecar Outfit.

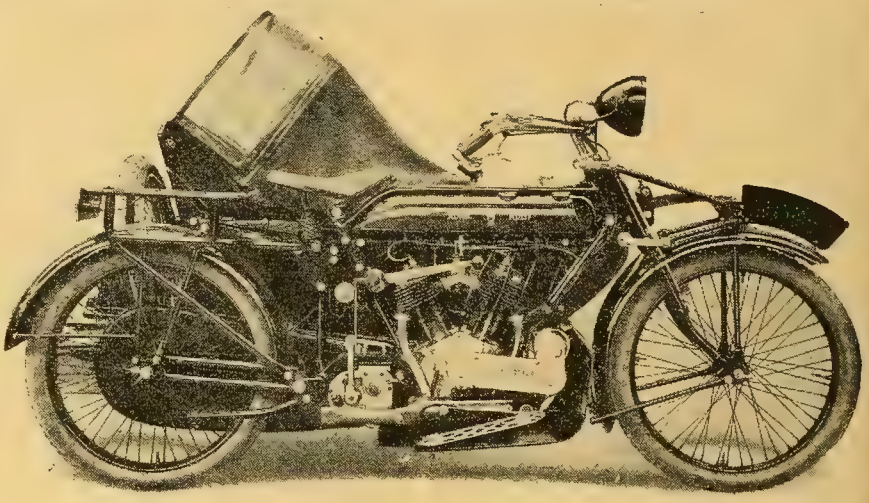
Detail Improvements on the 8 h.p. Royal Ruby Spring Frame Machine.

ALTHOUGH the 8 h.p. Royal Ruby machine was on view at the last Olympia Show, deliveries during the past year have been more or less confined to rigid framed models.

The spring frame design, however, with its adjustable insulation on the well-known Royal Ruby laminated spring system, has been submitted to searching tests, and now that the makers are installed in their splendid new factory at Altrincham, near Manchester, it will be put into production on a large scale, with certain detail modifications. Moreover, with Hugh Gibson actively connected with the Royal Ruby name, we shall no doubt see these machines taking a leading place in the competition world.



Simple springs of the sidecar body. The enlarged detail shows the lug and shouldered nut which allows the body to be instantly removed.



The 8 h.p. Royal Ruby, a machine which is completely sprung, including the sidecar chassis, and which is sold with a very extensive equipment.

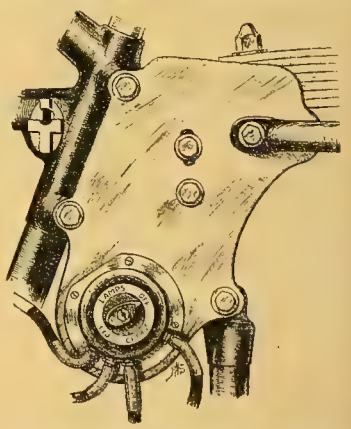
Probably the Royal Ruby passenger machine will be one of the most completely equipped machines on the market, since it will be supplied with the Lucas Magdyno outfit, a spare wheel, and an Easting windscreen, while, in addition to the usual kit of tools, a jack will be included which greatly facilitates wheel changing.

Car Type Mudguards.

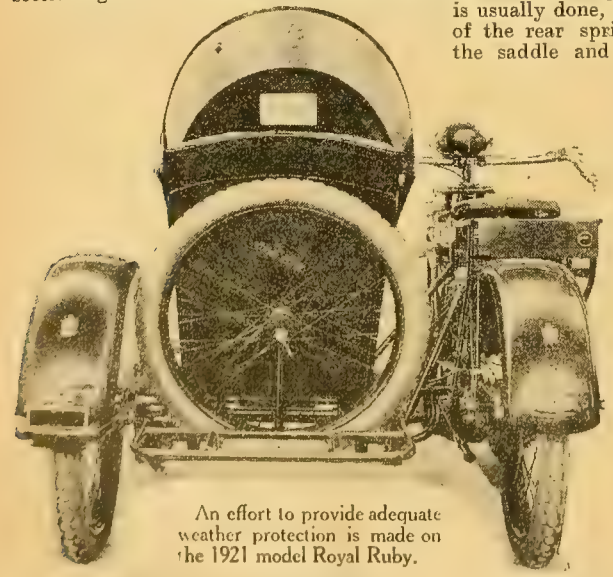
One noticeable feature is the ample arrangement for mudguarding; 8in. dome section guards are used on all three wheels, and these are all readily detachable in case of necessity. In addition, there is a large underscreen, which extends beneath the long adjustable footboards, and in front protects the Magdyno. During the general efforts to render the machine weatherproof, the transmission has not been overlooked, for the chains are protected in ample cases, which are easily removable. This, of course, is another amongst the growing number of British machines which combine a spring frame with complete chain guarding.

In general specification the machine remains unaltered. The power unit is an 8 h.p. J.A.P., with Amac carburetter and T.B. magneto or Lucas Magdyno. When the latter is fitted, the switch box, instead of being mounted in the tank, as is usually done, is carried on an extension of the rear spring housing plate below the saddle and on the near side of the frame; being thus between the machine and sidecar, it is unobtrusive, and so offers no temptation to tamperers.

The sidecar body is of the flat-bottomed variety, and is mounted on the spring wheel chassis on simple leaf springs in such a way that it can be easily detached by undoing four nuts, or swung forward out of the way, to facilitate any attention which the transmission may necessitate.

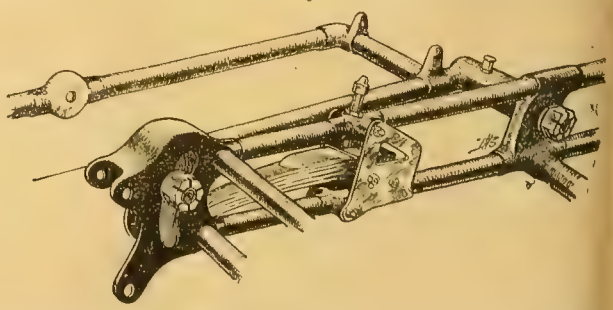


On the rear spring housing plate an extension is formed to carry the Lucas switch-box in a neat and unobtrusive manner.



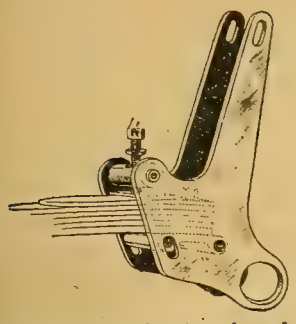
An effort to provide adequate weather protection is made on the 1921 model Royal Ruby.

8in. car-type guards, a large undershield, and an Easting screen are fitted as standard.



Adjustable spring suspension of the Royal Ruby sidecar wheel. The action of the wheel-supporting frame is guided by the special housing at the back of the chassis.

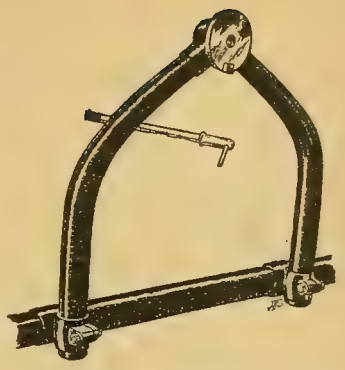
New Models.—



The front spring housing plates form a rigid connection between the fork crown and the head clip. The Royal Ruby method of spring adjustment is shown.

As before mentioned, an Easting screen is a standard fitment on the body, while at the back, as a separate unit attached to the chassis, is a large luggage grid and petrol can carrier. Immediately behind the body, but secured to the chassis, is the main portion of the spare wheel carrier, which supports the extra 28×3in. wheel and tyre. It will be seen that, although the grid and wheel carrier have the advantage of the chassis springing, they do not impose any extra load on the springing of the body, which therefore can be arranged for a normal load.

Details of the machine are made clear in the illustrations, and it remains to add that the finish is most attractive, being carried out in the characteristic Royal Ruby scheme of red and black with gold lining.



The spare wheel carrier on which the wheel is secured by its own centre bolt and driving dog.

A New Countershaft Gear Box.

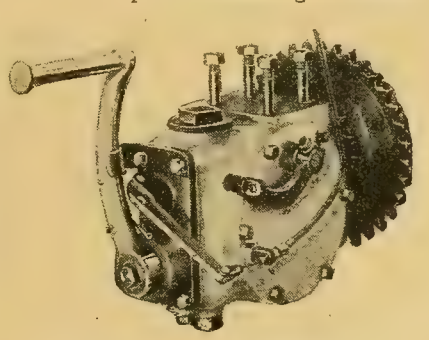
Only Six Constant Mesh Pinions provide Three Ratios and Kick Starter in the Comery Gear Box, which is suitable for Machines of any Power.

IT has been fashionable of late to disparage the gear box as an unmechanical survival of early engineering practice.

This criticism in many cases has some justification, but the Comery gear, of which we are now able to give a full description, fairly proves that this unit is just as amenable to inventive ingenuity as the engine itself. It is the product of a well-known designer, Mr. Comery, who was previously employed as chief engineer to the Raleigh Cycle Co., Ltd., and Sturmey-Archer Gears, Ltd.; and, from the lubrication arrangements to the top of the control lever, it simply bristles with novelties. These novelties are not complications, but those sure and simple touches that cause one to wonder why they have not been thought of before.

Burnished External Finish.

Before proceeding with the description, we must mention one fact of especial interest. The Comery gear is neither a drawing-office dream nor a backyard product. Plant, jigs, tools, and gauges are practically completed for the production of several hundred boxes a week, showing the complete confidence of the designer in his new product. Of the excellent workmanship we speak from actual knowledge, having personally inspected the well-equipped works at Nottingham. The gear box is of the countershaft type, and is suitable for machines up to 10 h.p. Commencing with the casing, this is a *one-piece* oil-retaining aluminium

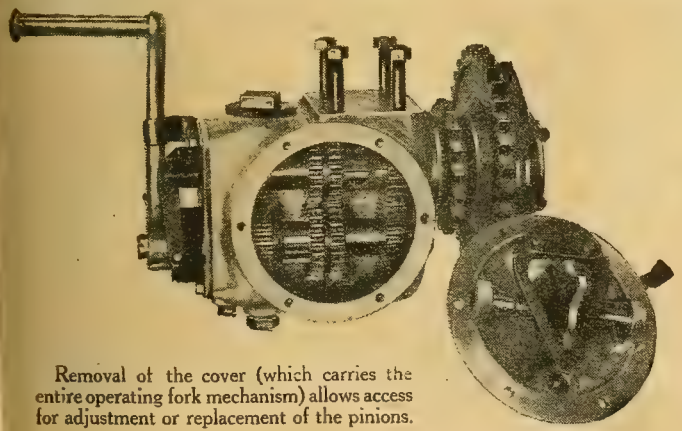


The clean external outline is noticeable in this view of the gear box, complete less control levers.

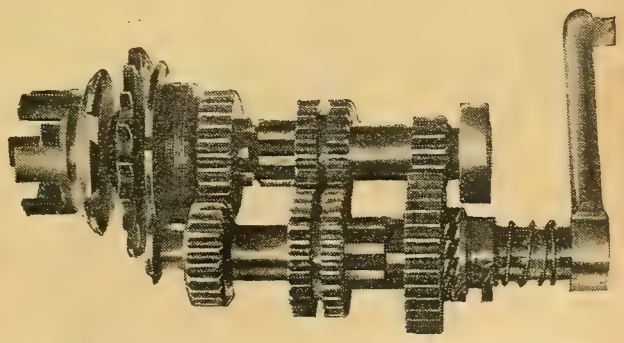
shell of exceptionally clean external outlines and polished finish. Thus the alignment of the shafts does not depend on the positioning of a detachable end plate. A large circular door (which, incidentally, carries the entire operating mechanism) permits the removal of the internal gears for repair or replacement. Six pinions only provide the three ratios and the kick start gear. Thus the action of the kick starter directly on to the low gear pinion allows the usual seventh pinion to be dispensed with. Large size Skefko ball races support the mainshaft, while the stationary layshaft lies directly underneath.

Constant Mesh Pinions.

For the purpose of explanation, the primary drive sprocket, mainshaft, and low gear pinion on the mainshaft may be regarded as one rotatable mass, although, as a matter of fact, the sprocket and pinion are splined on to the mainshaft, and may be replaced in case of wear. This method of construction is followed throughout, and thus the replacement of parts is simple and inexpensive. In the same way, the final drive sprocket or pulley, the near side pinion, and the sleeve on which both are mounted, may also be regarded as one mass rotating freely on the mainshaft. An extension of this sleeve beyond the pinion has eight splines or dogs. For about an inch and a half along the mainshaft there are coincident splines, and the diameter for the rest of its length is equal to the "bottom" diameter of the splined portion. The low gear (far side) pinion meshes with a pinion carried on a free sleeve on the layshaft, the inwardly pro-

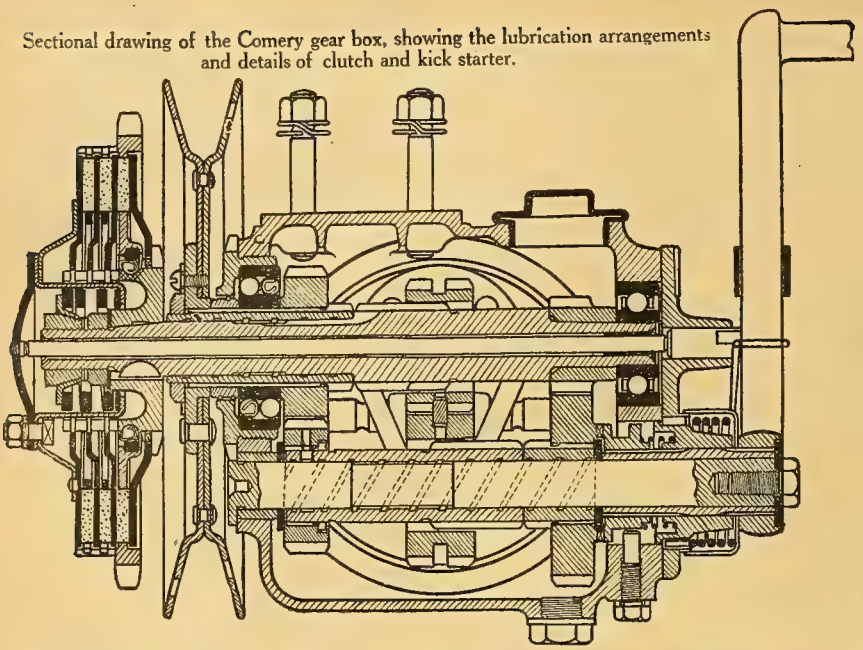


Removal of the cover (which carries the entire operating fork mechanism) allows access for adjustment or replacement of the pinions.



The simplicity of the Comery gear is well illustrated here. Note how the kick starter acts on the low gear pinion.

Sectional drawing of the Comery gear box, showing the lubrication arrangements and details of clutch and kick starter.



jecting part of the sleeve being splined in the same way. This layshaft pinion also forms the "quadrant" of the kick starter. Lastly, the near side layshaft pinion is mounted on a long sleeve running freely on the layshaft, this sleeve being externally a replica of the opposite side of the mainshaft. The two pairs of pinions mentioned so far are, of course, in constant mesh.

The rest is simple. A pair of axially movable constant mesh pinions, which are internally splined, and mounted on the mainshaft and layshaft respectively, give the various ratios by moving into positions where they clutch or free (or both) the various sleeves and shafts, and through them the pinions mounted thereon.

The Operating Mechanism.

For example, top gear is obtained when the upper movable pinion is half on the mainshaft splines and half on the splines of the sleeve carrying the rear drive, locking these members together and giving a direct drive. When the sliding pinions are in a central position, the drive is *via* the splines on the mainshaft, the movable pinions themselves, the splines on the long layshaft sleeve, the pinion on the same sleeve, and thence back to the rear drive sleeve on the mainshaft. Movement to the extreme far side clutches the two layshaft sleeves, the low gear drive then being "right round the gear box."

To ensure easy engagement, every alternate working spline in the box, internal or external, is cut away for a short distance. In practice, although an extremely neat delayed action rod is incorporated with the outside operating lever, the gears, when positively moved, slide in and out easily at any speed, like the bolt of a well oiled rifle.

As already mentioned, the gear box cover carries the operating mechanism, which consists of a fork which projects in a recess formed by centrally grooving the sliding pinions. This fork slides on a guide bar grooved at the various gear positions, and held at these points by a spring plunger. It will readily be understood that this construction automatically locks each gear independently of exact adjustment of the quadrant. Radial movement of a pear-shaped member (see illustration) converts a pull or push motion of the hand lever to an axial movement of the fork. Incorporated in

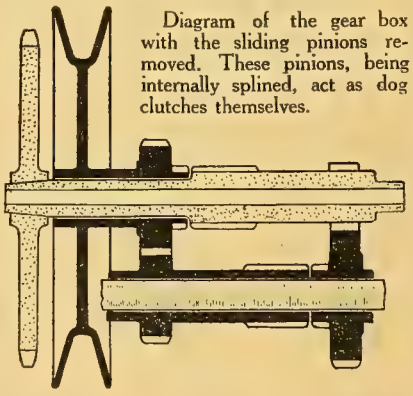


Diagram of the gear box with the sliding pinions removed. These pinions, being internally splined, act as dog clutches themselves.

the outside control rod is an enclosed delay action device, which should be quite clear from the drawing without further explanation. The whole control mechanism—and indeed the whole gear box—has a minimum of working parts.

The subject of a separate patent, the gate and quadrant are adjustable to any size and shape of tank. A slight rocking movement controlled by a light spring allows the hand lever to find the staggered wards of the gate. It is thus impossible to "miss" a change even in the dark.

An Oilproof Clutch.

Returning to the gear box, or rather to the clutch, this member (of the disc type) is a big advance on the average method of obtaining a free engine. It is of large diameter, and has six driving surfaces of Ferodo. Since the Ferodo takes the form of insets, and does not extend continuously round each disc, the clutch is unaffected by leakage of oil. The driving centre of the Comery clutch is solid, and one large adjustable spring keeps the discs in contact.

Clutch Operation.

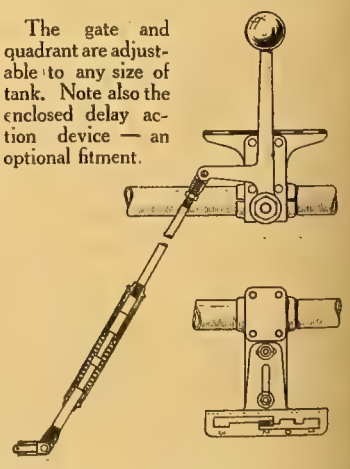
The usual method of disengaging the clutch, *i.e.*, by a push rod extending through the hollow mainshaft, is incorporated, but instead of the more common worm a simple lever, pivoted near to the end of the push rod, is pulled inwardly by the Bowden wire from the hand control. Running under the tank, and behind the engine instead of underneath, the clutch wire may be adjusted by means of the ordinary Bowden screwed nipple. Less exposure for highly important control mechanism is the undoubted advantage claimed for this alternative path for the clutch wire.

Splined on to a sleeve on the layshaft, the kick starter lever is of heavy construction. Its return spring is enclosed, as are the engaging dogs and disengaging cam.

Lubrication.

Finally, the lubrication arrangements are so complete and efficient that they must be briefly outlined. A large filler cap permits the oil-tight box to be partially filled with oil. The near side pinions being radially drilled to their respective shafts, the oil is forced under pressure to the two shafts, which are spirally grooved and recessed where necessary, and special provision is made to lead the lubricant into the main ball race.

This box, of course, may be obtained suitable for either final chain or belt drive; and the pulley and sprocket lines suit standard engine and frame dimensions.



The gate and quadrant are adjustable to any size of tank. Note also the enclosed delay action device — an optional fitment.

These are the main points of the Comery gear that will interest the average reader. However, the engineer will find many more interesting constructional and manufacturing details upon personal examination, and we advise all who can to make a point of visiting Stand 64 at Olympia.

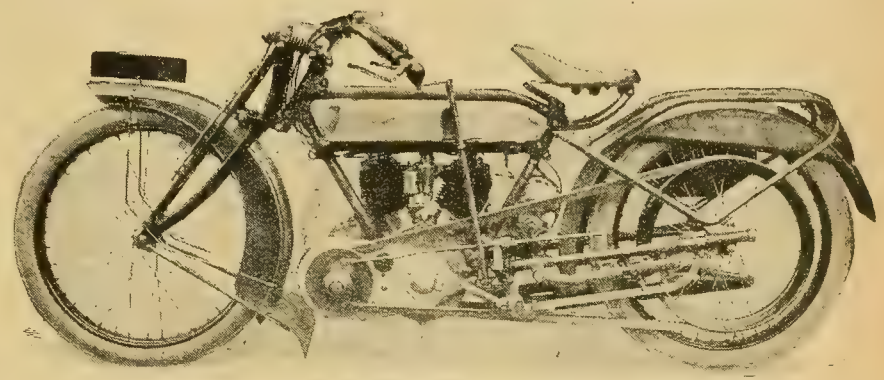
Detail Improvements for Zeniths.

Many Refinements on Standard Models; a New Flat Twin to be Exhibited.

IN the new models of the Zenith for 1921, the chief alterations are in the nature of detail improvements which have been found desirable in practice.

Particular attention has been paid to mudguarding. The front mudguard extension, instead of following the curve of the wheel, now slopes up slightly, with the result that the liquid mud has a chance to run to the rear. A further improvement is the addition of a mud-flap, underneath which the front stand is fastened. With this improved mudguard there is now no necessity for the shield, which serves to protect the belt and clutch casing on former models Moreover, this and the crank case are not shielded from a cooling current of air. The side valances to the rear mudguard are now provided with a trough, which prevents mud and wet from dropping directly on to the belt rim. One of the new features will be a front brake acting on a dummy belt rim, and this is both smooth and powerful in action.

So far as the transmission is concerned, the chain to the countershaft is now entirely enclosed in a handsome aluminium casing, the top half of which may be removed after undoing three bolts. This casing has done much to silence the chain, which, after a personal trial, we found to be **quite inaudible.** Some considerable improvement has also been effected in the method of working the clutch, which is now released by means of an exceedingly long pedal; with the latter is incorporated an ingenious pawl allowing the clutch to be held out of engagement when the machine is brought to a standstill.



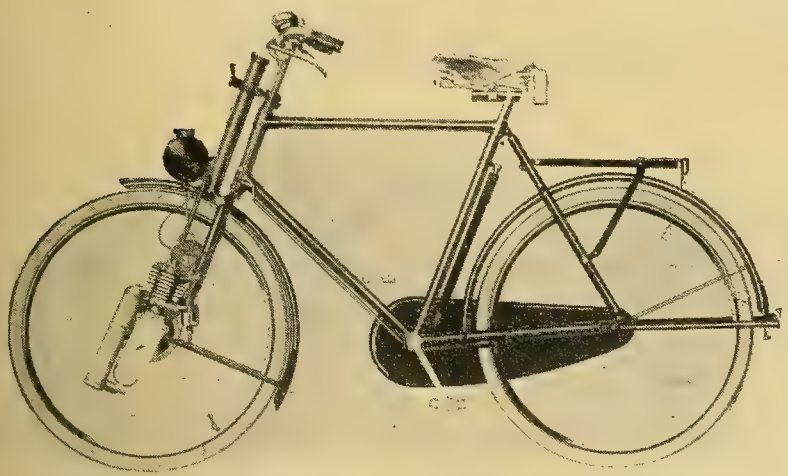
The 1921 Zenith, to which several detail improvements have been made.

An 8 h.p. Sports model will be made, and it is equipped, like the machine we have just described, with 28×3in. tyres and the latest pattern mudguards, but it is without a clutch.

The 2¾ h.p. flat twin and the 5 h.p. models will remain practically unaltered, while the new Bradshaw-engined model with its horizontally-opposed power unit, which is described elsewhere in this issue, will be one of the Show's attractions.

A Motor in the Front Wheel.

An Ingenious Auxiliay Unit to be Shown at Olympia.



The Cykelaid motor-propelled pedal cycle, with the engine embodied in the front wheel.

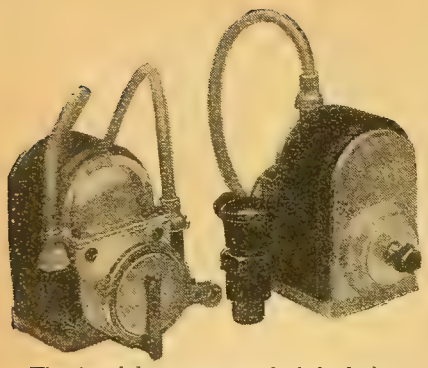
THE latest auxiliary engine for fitting to pedal cycles is the Cykelaid, which will be shown at Olympia, and is illustrated on this page. Briefly, the unit consists of a complete front assembly, *i.e.*, front forks, wheel, and engine. The forks are of the spring type, and the shaft of the 1¼ h.p. two-stroke engine passes through the hub of the wheel, having the flywheel on one side and the rest of the engine on the other. Two chains are used for the transmission, with a small countershaft embodying a cork insert clutch on the right fork blade. Lubrication is mechanically controlled by means of a small rotary pump in the base of the oil chamber, which consists of a tube forming part of the fork construction. The rest of the details may be seen from the illustrations. The makers of the Cykelaid are the Sheppee Motor Co., Thomas Street, York.

A Magneto for Lightweights.

A New Runbaken with Conventional Type of Make and Break.

AS a featherweight magneto, the Runbaken has already earned an enviable reputation, and for 1921 the manufacturers have decided to retain practically all the main features of previous models, with one notable exception. The parallel action make-and-break, which has up till now been a feature of this particular magneto, has been replaced by the more usual bell crank type with which the motor cycling public is already familiar. In making the alteration, the makers have been characteristically thorough, and it will be noticed that the cam is made in one piece with the whole of the outer casing, and is of considerable thickness in order to prevent distortion. The advance lever takes a friction grip on this rocking member, and can be moved to the most convenient position for controls, and a brass liner is placed in the housing, so as to ensure a free bearing for the advance mechanism

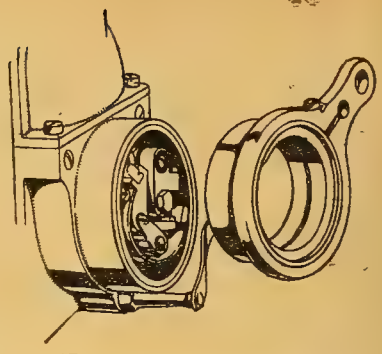
The edges of the single horseshoe magnet are now rounded, which gives a neat appearance to the instrument, and has a slight electrical advantage. It will



The size of the magneto can be judged when compared with the standard sparking plug.

be remembered that laminated pole shoes are employed, cast in with the aluminium carcase, and that the armature bearings are insulated from the body to prevent earthing through the ball races, as this has been found to be detrimental to the races. The latest type is fitted with a convenient type of detachable and waterproof high-tension terminal. An additional feature is that brass bushes are cast into the stud holes by which the magneto is attached to its platform.

Magnetos suitable for either single-cylinder or twin-cylinder engines can be supplied, and our illustration gives a good idea of the size of this tiny magneto. In spite of its size, however, the Runbaken magneto is no toy, but a highly practical and beautifully made instrument.

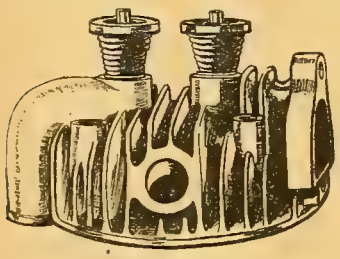


The new contact breaker of the Runbaken lightweight magneto.

An Unconventional Flat Twin Engine.

A Bradshaw Power Unit to be fitted to Zenith Machines.

AS might be expected, the new engine from the hands of Mr. Granville E. Bradshaw is full of very interesting features. Mr. Bradshaw is nothing if not original, and in the design of the medium-weight engine under consideration he has certainly excelled himself. There is nothing freakish in the engine, yet it is full of originality. His aim has been to produce the highest possible power for the engine capacity, and, notwithstanding the many special features, manufacturing possibilities have not been ignored. Mr. Bradshaw has worked on the theory that



The cylinder head of the Bradshaw flat twin.

the air-cooled engine is in effect largely an oil-cooled engine, and therefore if the engine is to be kept cool the lubrication system requires special attention. Recent experiments have proved that the amount of heat dissipated by the crank case is relatively large, and Mr. Bradshaw has set out to keep the crank case cool and to keep the pistons cool, and claims that, having done this, a considerable step towards perfection in air-cooling has been taken.

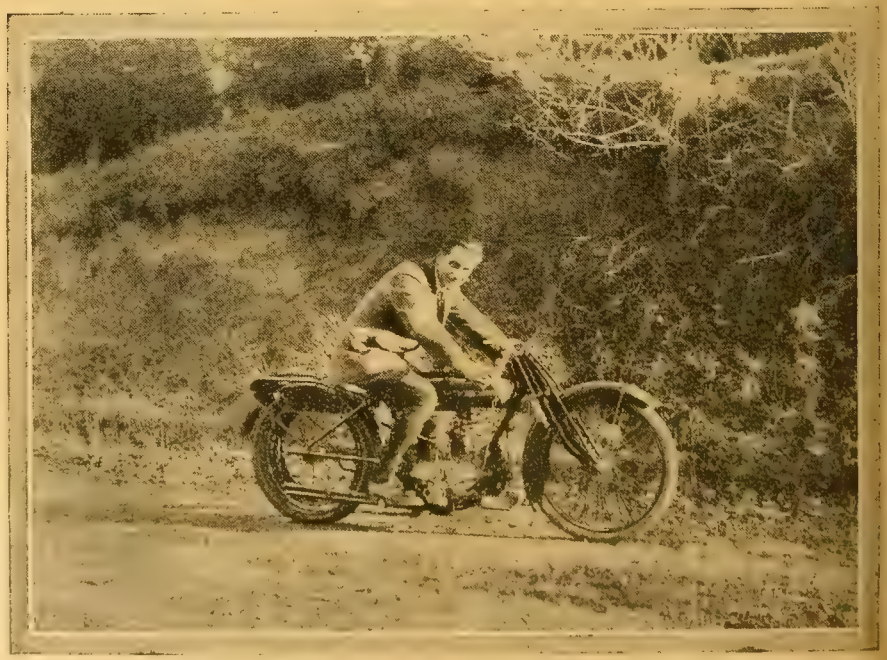
Partially Concealed Cylinders.

Contrary to his usual practice, Mr. Bradshaw has made use of cast iron cylinders. These take the form of liners pushed into the aluminium crank case and clamped in position. The reason for this choice of cast iron is that it is found to be more satisfactory than steel when aluminium alloy pistons are employed. These pistons are of quite plain design. They possess the usual gudgeon pin fastening as found in aero practice, which has been for a long time adopted in A.B.C. engines, and are provided with a single piston ring at the top and a scraper ring at the bottom.

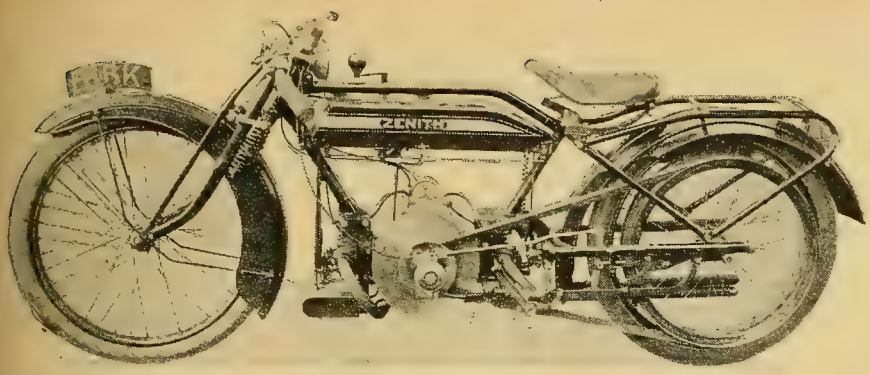
Practically none of the cylinder projects beyond the crank case. The orifice into which the cylinders fit is bored a few thousandths small, so that they are held firmly in position by the clamping together of the two halves of the well-ribbed crank case casting. Since the induction pipes form part of the crank case casting, each cylinder flange has a port in it registering with the inlet port in the crank case, and this in turn registers with the port in the cylinder head proper. The cylinder head is a nice piece of design, although it is not hemispherical in shape. Like every other part of the engine, it has been carefully thought out. Between each valve there is a deep recess down to the actual thickness of the head casting, so that there is no unnecessary metal in the hottest part of the head, and there is a clear passage of air between the two valves. The actual bolts through the cylinder head clamping it on to the cylinder serve also to support the spindle on which the valve rockers work. These supports being adjustable may be made use of for the purpose of taking up the wear, while the push rods are provided with the usual adjustment.

Dual Pump Lubricators.

Internally, careful attention has been paid to the lubrication of the engine, which is effected by means of two pumps driven off the timing gear, and situated at the base of the crank case. Both these pumps are of the gear type, and are placed side by side in a single gun-metal casting consisting of three parts. Owing



J. L. Emerson astride the new Zenith which is fitted with a Bradshaw flat twin engine.



The latest model Sporting Zenith, engined with a very striking flat twin designed by Mr. Granville Bradshaw.

to the design of these pumps, which are driven off the crankshaft, incorrect reassembly is impossible. The small pump delivers oil from the tank to the hollow crankshaft, while the larger pump pumps the oil back again to the reservoir. Since forced lubrication under high pressure is employed, plain phosphor-bronze bearings are used for both small and big ends, and the oil, after circulating through the drilled crankshaft, is ejected on to the camshaft, which carries all four cams. This camshaft lies below the engine, and splashes the oil over the timing gear case which is used to radiate the heat.

The Mainshaft Bearings.

So far as the mainshaft is concerned, the driving side has one roller bearing and one ball bearing running in a steel housing, provided with an oil-retaining washer. The other side of the crankshaft runs on two plain bearings, the shaft at a point adjacent to the flywheel being 30 mm. in diameter. Next comes a sharp taper to take the flywheel, and then a square shaft for the fitting of the Gradua gear.

Amongst the most interesting features in the design are the induction pipes, which, as we have said before, are cast in the crank case on the side opposite to that on which the flywheel and distribution gear are situated. This renders the magneto accessible. The new single-lever motor cycle model Zenith carburetter is to be standard on these engines, and is bolted to the centre of the induction pipe at a point where a V-shaped projection is formed in the casting in order to direct an equal quantity of mixture to each cylinder. The carburetter is provided with a lateral adjustment, so that if there is any irregularity of firing the distribution may be corrected by a slight movement to the right or left. Yet another important feature in the design of the induction pipe is the fact that each pipe rises from the carburetter—a fact which has been lost sight of by most designers of flat twins.

Induction Pipe Design.

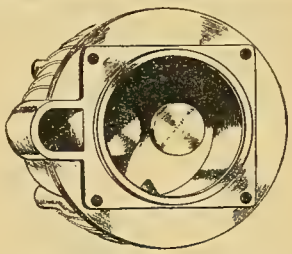
This means that there is never an accumulation of unvaporised petrol adjacent to the inlet valves. The valves themselves (of the overhead type) are of ample size, and each one is larger than half the bore of the cylinder. The valve mechanism is entirely controlled by straight rods, and is, we are assured, absolutely silent.

An ingenious form of magneto coupling has been fitted, which clips on to the magneto shaft, and is provided with a dog engaging with the shaft, so that the magneto can only be reassembled in the right place.

Essentially a Sporting Mount.

This engine, which is made by E. T. White and Co., 1, Albemarle Street, London, for its designer, Mr. G. E. Bradshaw, will be a feature of the exhibit of Messrs. Zenith Motors, Ltd., at Olympia, where it will be seen built into a specially-designed frame, the whole proving to be an ideal sporting mount. No clutch will be fitted, simply the Gradua gear, so that there are as few complications as possible, and yet an adequate means of altering the gear ratio to suit varying conditions is provided.

An experimental racing model has been on Brooklands track for some time. An oil tank is situated in front of the engine, in which the lubricant is cooled



Interior of the cylinder head.

before returning to the oil delivery pump. The Gradua gear lever projects through the tank, and is connected by bevel wheels to a long rod running underneath it, on the rear end of which is the chain wheel connected to the rest of the gear mechanism. This machine, which is practically a replica of the type which will be sold to the public, has already shown great promise on the track, while the appearance of the new model will undoubtedly create a sensation.

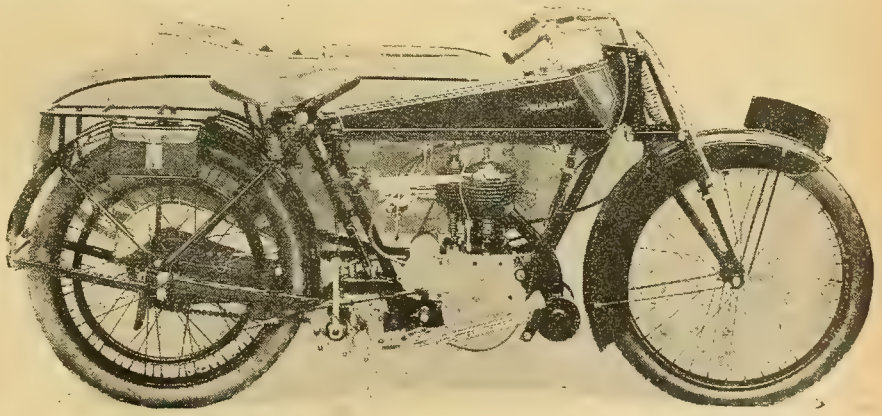
The New 6 h.p. Quadrant.

A Powerful Single-cylinder Passenger Machine.

ONE of the best known names in the early days of motor cycles, the Quadrant remains a sound straightforward machine that is a typically British production embodying good workmanship and solid useful design.

The latest addition to the Quadrant range is the new 6 h.p. single-cylinder outfit, which in all its main features closely resembles the better known 4½ h.p. model.

Having a single bore and stroke of 87 × 110 mm. respectively (653 c.c.), the design retains the well-known Quadrant disposition of the valves, the exhaust being at the side, and the inlet behind the cylinder. Special care has been taken to ensure an easy flow for both inlet and exhaust gases, and two features in this respect are obvious, though a full appreciation cannot be obtained without sectional drawings. The obvious features are the gradually expanding inlet pipe, and the very large expansion chamber for the exhaust gases. The silencer itself is of unusual construction, in that the end plates form part of the engine cradle castings, and hold between them a large diameter tubular expansion box, from which a tail pipe runs below the left footboard.



A single-cylinder of 653 c.c. The 6 h.p. Quadrant, a sturdy machine of sound construction.

New Models.—

The all-chain drive is protected by cast aluminium covers, which, like the crank case, are beautifully polished.

Accessibility has been studied throughout the machine, and by the removal of two nuts the left footboard, the chain case and silencer tail pipe can be removed, giving immediate access to the primary chain and the drive side of the engine. A choice of Amac, Senspray, or B. and B. carburetters is provided, and the whole machine is built in keeping with the sturdy single-cylinder engine. In spite of this it is not clumsy, and the sloping saddle tank gives a very clean appearance.

It has been the special care of the designer to include every refinement that is necessary, and to exclude such features as are not essential, but would cause a considerable increase in price. For these reasons we find that a new compensated rear brake, acting on the inside of a dummy belt rim, and good mudguarding, have been included, while ample sized tyres are used, but interchangeable wheels are considered to be a luxury, and therefore are not fitted.

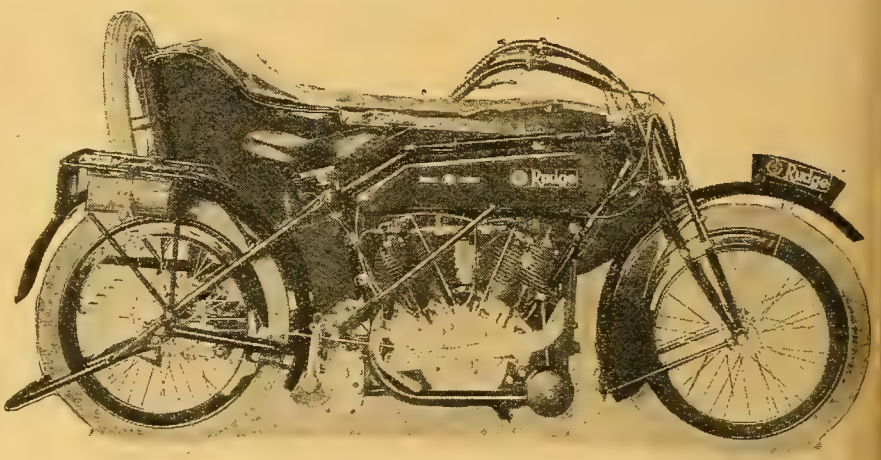
We are looking forward to an early road test of this fine sidecar outfit, and we are expecting a performance which will be up to the standard of the design.

An All-chain Rudge.

The 8 h.p. Twin—Now Fitted with Three-Speed Countershaft Gear, Chain Drive and Interchangable Wheels.

IN addition to the well-known single and twin-cylinder Rudge-Multi models an entirely new passenger outfit will be staged at the forthcoming Olympia Motor Cycle Show. This machine is certain to attract a large amount of attention, since it is a newcomer to the ranks of the 1,000 c.c. sidecar machines, which are so popular at the present time. There are many features of considerable interest, though such well-known components as the Rudge spring forks, separate oil tank with pedal control pump, and the sloping top tube are, of course, retained.

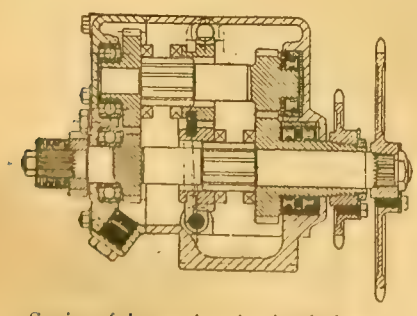
The 85×88 mm. V type twin engine is similar to that which has already proved itself in connection with the Rudge Multwin, with the exception of the fact that the magneto is placed behind the rear cylinder and gear driven from the timing gear. Mounted on the crankshaft is a multiple clutch similar to that already well-known to Rudge riders, but carrying externally a spring drive in the form of a series of face cams on the driving sprocket, held by a spring in engagement with a corresponding series on the driven member. A cast aluminium chain case protects the primary chain to the gear box.



A 8 h.p. twin three-speed countershaft gear model is the latest development of the Rudge Company. The interchangable wheels will be noticed.

Roller Bearing Gears.

Singularly stout construction characterises this new box. Both shafts are of large diameter and heavy splines are used. All gears are in constant mesh, top and low being engaged by means of stepped dogs having slightly inclined faces. Middle gear is obtained when the two central gears which move together are both locked on their respective shafts by the splines. It should be noted that a double row roller race is employed on the primary member, and large single row roller and ball bearings in other parts of the box. The kick-starter is of the exposed type, but provides ample leverage, and is stoutly constructed. A second chain transmits the power to the rear sprocket, which is mounted on double row bearings in the rear forks. All wheels are instantly removable and interchangeable, the hubs being of the well-known tubular construction associated with the manufacturers.



Section of the gear-box showing the heavy shafts and bearings.

Large ball bearings are used and the drive is taken through a series of dogs, all working parts of the hub being thoroughly protected by caps. Each wheel is equipped with a large diameter brake drum flanged on to the wheel rim, and since the shoes of both back and front brakes are of considerable length a very satisfactory retarding effect should be obtained.

All-steel Frame Construction.

At first sight it would appear that the frame is of normal construction, but it should be pointed out that steel lugs are used throughout. This feature extends even to the engine plates and gear box bracket. This latter is a steel stamping bent over to form a channel in which the box is gripped, and since both quadrant and gear lever are carried on the box any movement of the box to compensate for chain stretch will not affect the selecting mechanism. In order to render easy the removal of either cylinder, the lower tank rail is set over to one side to a considerable extent, but this in no way detracts from the pleasing appearance of the machine. 650×65 Dunlop grooved tyres are fitted, and a roomy and comfortable sidecar is attached to this powerful outfit. Details include a Senspray carburetter, set vertically between the cylinders, the well-known spring-up stand, large aluminium footboards, and a serviceable black finish to many parts which are usually plated.

A short trial run convinced us of the ample power of the engine and the absence of snatch from the chain transmission. Gear changes were made easily and quietly; indeed, in spite of the fact that we were entirely strange to the box, the changes were practically inaudible.

Exterior of the gear-box showing quadrant and change speed lever mounted on the box.

Improvements to a Pioneer Model.

The 6 h.p. and 8 h.p. Bat Machines fitted with New Spring Forks and Gear Box.

THE new Bat models which will be exhibited at Olympia embody numerous interesting and novel features. The exhibit will consist of 6 h.p. and 8 h.p. solo models, and 6 h.p. and 8 h.p. sidecar outfits, with and without dynamo lighting. Despite the improvements to which we have referred above, the design has been in no way complicated, the working parts are even more accessible than before, and the weight has been in no way increased.

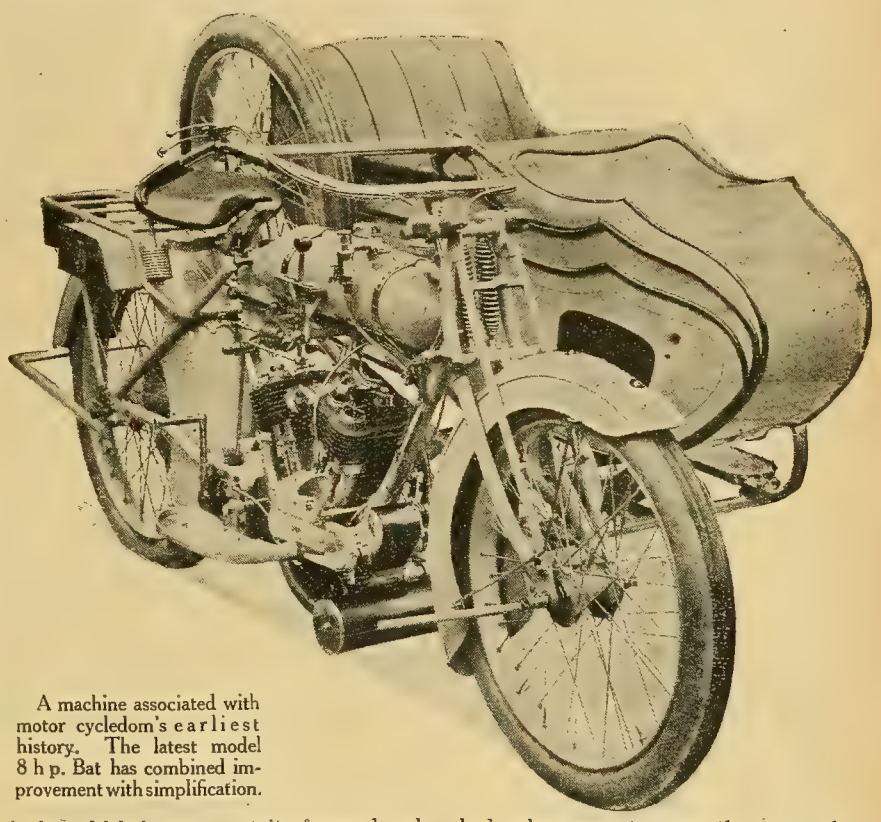
When the Lucas Magdyno forms part of the equipment, a special chamber to contain the switch box is let into the tank, otherwise no alteration has been made. The chief difference from previous years lies in the adoption of 28×3in. wheels, Brampton spring forks, and the fitting of a Sturmey-Archer three-speed gear box incorporating clutch and kick-starter. The gate change at the side of the tank has been retained, and the lever from this runs direct to the standard delayed-action control mechanism, which is bolted through the saddle tube.

Spring Insulation for the Driver.

The original and effective Bat spring seating has been retained, but it has been considerably improved in design. Although originally marketed in 1902, it has since undergone little modification; the device consisted of springing the saddle in conjunction with the footboards, these latter being hinged at their forward ends. The new footboards, however, may be described as being of the full floating variety, since they are only attached to the crossbar at the base of the sprung portion of the frame. This new method of fixing has greatly increased the comfort of the machine, as the footboards are no longer anchored at one end; at the same time, they are adjustable and quickly detachable.

The silencing arrangement consists of a large expansion chamber, which is easily detachable for cleaning purposes, and a long securely stayed tail pipe. As before, the transmission is by chain, but the chain employed is the Brampton spring link pattern, which efficiently absorbs all engine shocks.

Considerable ingenuity has been displayed in the design of the chain covers, the top half of which may be removed by undoing three screws. A clever improvement is the method of fixing the sidecar body, which is sprung at its forward end on small C springs, and at the rear on long quarter-elliptical springs. The method of anchorage to the two pairs of springs consists merely of two long bolts, which pass through the special shackles at the end of the springs and through tubes underneath the sidecar body. The withdrawal of one of these bolts allows the body to be swung out of the way in the event of adjustments being necessary on the near side of the motor cycle.



A machine associated with motor cycledom's earliest history. The latest model 8 h.p. Bat has combined improvement with simplification.

Ample Locker Space.

Several types of sidecar bodies will be shown, while that illustrated is not only exceedingly comfortable, but has plenty of locker space behind, on the top of which is a small luggage grid. The body also serves to carry the spare wheel carrier. The sidecar chassis is mainly composed of short tubes, is simple in design, and strongly constructed. A sidecar stand is included in the latest model.

The ingenious detachable wheel with hinged distance piece, detachable rear mudguard, and the sprung sidecar wheel, introduced last year, remain unaltered.

One of the most interesting exhibits on the Bat stand will be the Bat taxi-sidecar, the body of which seats two side by side, and is attached to a chassis which is less than 1ft. wider than the standard. The method of springing is the same, which system leaves more room than the usual type of C springing, but in this case the body is suspended on six springs instead of on four.

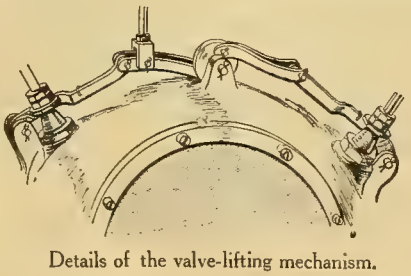
A Famous Swiss Product.

M.A.G. Engines for 1921. A New 90° V Twin and a Small Single, with Detail Improvements on all Models at Olympia.

AMONG the M.A.G. engines which will be at Olympia may be mentioned the small single-cylinder models which are not at present very well known in this country. As regards excellence of finish, design, and workmanship, they follow very closely the lines of the better known and larger twin-cylinder models.

The following improvements have been incorporated in all the engines exhibited: improved balance, a telescopic tube protecting the tappet rod which allows the tappet to be adjusted without interfering with the inlet dome, an improved inlet dome giving a freer passage to the mixture, larger radiating fins, and larger cams giving increased lift to the valves. These engines will be generally quieter, and yet will provide more power.

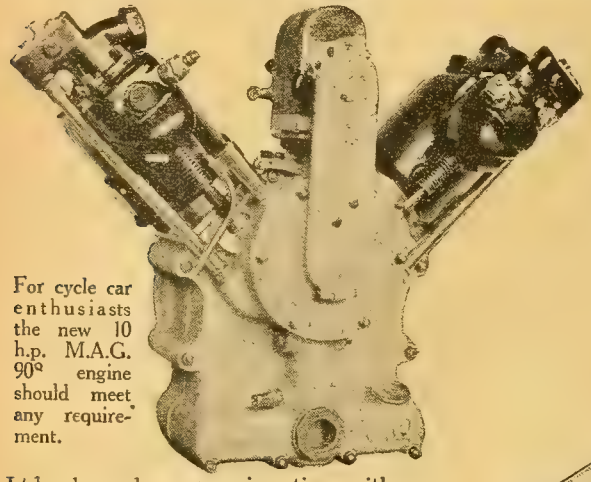
The Morgan engine will have the position of the bevel altered so that it may be more easily extracted. This will entail the fitting of a magneto running in a clockwise direction, but otherwise the standard specification is followed.



Details of the valve-lifting mechanism.

New Models.—

Quite a novelty is the 90° M.A.G. water-cooled cycle car engine, 82 mm. × 102.5 mm., 1,100 c.c. We have known for a long time that M.A.G. Engines, Ltd., have been experimenting with a forced lubrication system. This is now carried out by means of a plunger pump on the timing gear side of the engine, driven by means of a cam off the crankshaft, from which run three leads, one to the timing gear, and one to each crankshaft bearing.



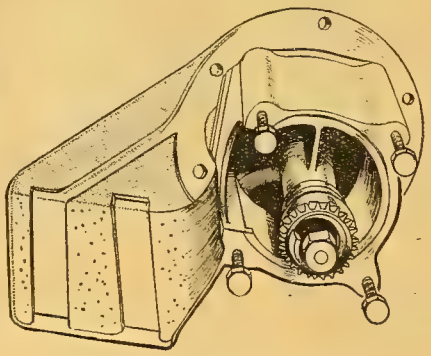
For cycle car enthusiasts the new 10 h.p. M.A.G. 90° engine should meet any requirement.

Mechanical Lubrication on 90° Engine.

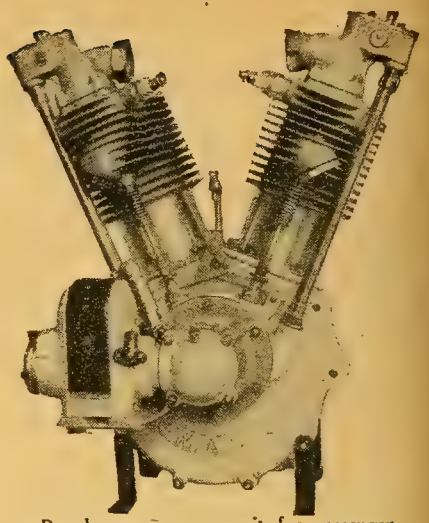
An ample supply of oil is carried in a large flat-based sump at the base of the crank case, into which it is introduced through a large filler cap. At the base of the sump is a glass window.

The magneto is mounted on a platform between the cylinders, and is driven by means of an enclosed chain from the mainshaft. The chain may be adjusted by slackening or tightening the nuts on the retaining bolts which serve to raise or lower the magneto from the platform.

Valve-operating mechanism follows M.A.G. principles throughout, but a new type of exhaust lifter has been introduced. The mechanism consists of two links connected by means of a small wheel to two cranks thereon. The action of pulling up the lever serves to raise the left-hand valve, and at the same time pulls round the wheel, causing a similar movement on the right-hand valve stem. A release valve is now supplied to the oil sump, which serves to return the oil thereto if the pressure is too great; this feature eliminates any danger to the pump driving mechanism.



The hand-starter pinion of the M.A.G.



Popular as a power unit for passenger machines of all types—the 8 h.p. air-cooled twin M.A.G.

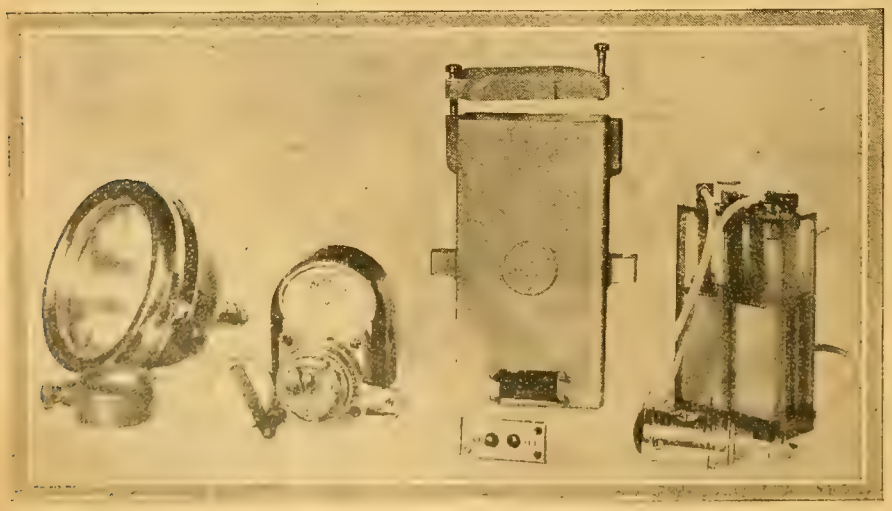
In addition to the above, the range of M.A.G. engines exhibited will consist of the 2½ h.p., 250 c.c., 64×77 mm.; 2¾ h.p., 300 c.c., 64×92 mm. (both these are single-cylinder models); the 3½ h.p., 500 c.c., 67×77 mm.; the 6 h.p., 750 c.c., 72×91 mm.; and the famous 8 h.p., 1,000 c.c., 82×94 mm.

Lighting from the Magneto.

A B.T.H. Electric System for Two-stroke Singles involving only an Additional Fitting on the Contact Breaker.

THE inventiveness of our electrical experts which, during the period subsequent to 1915, placed the English magneto in a plane above anything previously produced has not been allowed to lie dormant.

Most of the designers of magnetos have turned their attention to the adoption of compact and highly efficient lighting sets for motor cycle use, and the latest entrant to this field is Mr. A. P. Young, of the British Thomson-Houston Co.



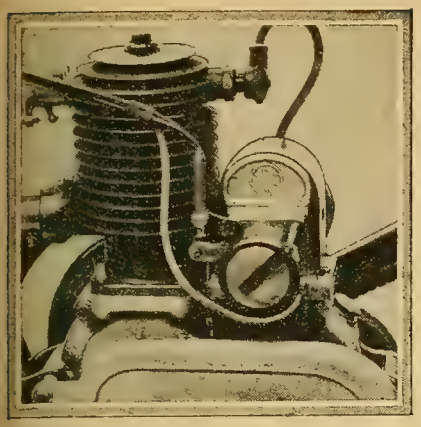
Electric lighting for two-stroke singles; the complete B.T.H. apparatus which utilises the surplus low-tension current of the standard magneto for lighting and charging.

Realising that there exists an enormous demand for a reliable lighting set which can be easily applied to the two-stroke lightweight machine, a simple system has been evolved which works in conjunction with the ordinary high-tension magneto, and yet eliminates all the objections which have previously been raised against such methods of using the surplus current generated in the ignition unit.

Using Surplus Energy.

It will be realised that in the single cylinder magneto running at engine speed (as is the case with single cylinder two-stroke engines) there are two maximum positions of the armature, but only one of these is used for ignition purposes, and the B.T.H. system, by an extremely simple arrangement, makes use of this fact.

The only additions to the ordinary magneto are an extension of the contact breaker casing, which contains an insulated segmental track and a centrifugally controlled brush connected to the primary winding through the insulated portion of the contact breaker, with which it rotates. When the magneto is running at any speed above 500 r.p.m. this brush is thrown outwardly so that it runs upon the track segment which is connected by a single wire to the accumu-



An extension of the contact breaker casing is the only external feature of the B.T.H. combined magneto and lighting generator.

lator. The other terminal of the accumulator is earthed to the frame through which the circuit is completed.

Independent of the Ignition System.

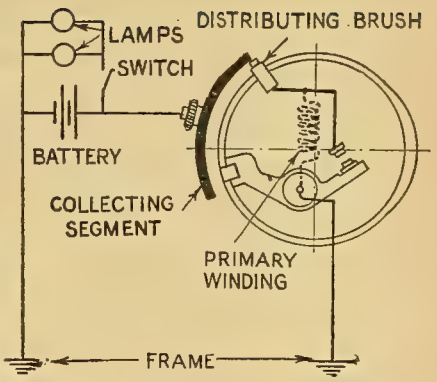
The insulated segment of the lighting collector ring is so placed that the brush is only in contact with it during the building up of that primary current which is not used for ignition. It will be seen, therefore, that as the lighting circuit is disconnected during the period of propagation of the high-tension spark, the quality of the latter is in no way deteriorated. In the same way it follows that the use of the primary current for lighting has no effect on the starting of the machine, especially when the centrifugal control of the before mentioned brush keeps it out of action at very low speeds.

The Lighting Equipment.

As the set is only intended for solo machines, a head and tail lamp only are supplied, and the bracket which carries the former is also arranged to support the cast aluminium box for the accumulator. The latter is specially made to avoid splashing, and it will be noticed from the illustration that it is of very great depth, only about two-thirds of the interior being filled with acid, so that there is no possibility of splashing out over the top. Combined with the battery box is a simple switch for the lamps, this being the only part of the set which requires attention from the driver.

Low Price Possible.

Owing to the fact that the component parts are few and simple, it is expected that the complete outfit will be marketed at a comparatively low price. The makers are also seriously considering the organising of a department for the conversion of any existing single-cylinder two-stroke magneto. At a later date the apparatus may be made suitable for other types of engines.



A diagram of the primary circuits for lighting and ignition.

Results in Practice.

On test, the B.T.H. lighting and ignition system has proved thoroughly satisfactory, having already been used in the maker's hands for some 5,000 miles. It is found that the average charging current obtained at 20 to 25 m.p.h. is about .65 amp., while the demand of the two lamps is .9 amp. This means to say that the battery is only discharging at the rate of .25 amp., and in consequence, the battery will remain in good condition if the period of use at night is in the proportion of one to three of daylight riding; of course, few riders exceed this.

Royal Enfield Innovations.

New Engine built by Vickers. Kick-starter on Two-stroke Model.

EVER since its first introduction to the public the Royal Enfield sidecar outfit has stood in a class by itself. Prior to the war it was obtainable at a lower cost than the average present-day lightweight with two-speed gear, and its price set a standard which many tried to emulate, but few succeeded in doing.

A New Engine.

It is the only twin-cylinder sidecar outfit on the market to-day, having only two gear ratios. These, however, must not be regarded as inadequate, for the reasons that render a three-speed gear necessary on most other machines do not exist with the Royal Enfield, *i.e.*, friction losses in the gear box, and excessive over-all weight. It is not generally realised that the Royal Enfield is the lightest machine of its power on the road.

Weight-power ratio plays a very important part in the performance of a machine, and in this respect the Royal Enfield is certainly at an advantage.

The performances of this machine in the classic reliability trials have proved its hill-climbing abilities, while there are but few private owners who consider that a third ratio is necessary. The majority who have given this matter consideration probably affirm that the advantages obtained by the use of the simple Enfield gear outweigh any inconvenience caused by the lack of a middle ratio, since all frictional losses are eliminated by having both gears direct.

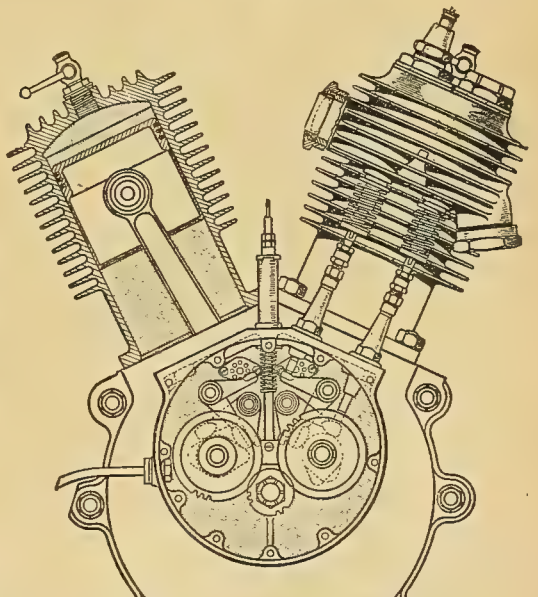
The 1921 model will again be offered with a few minor modifications, and one important innovation. It will have a new engine of Enfield design, which is built by the famous Vickers firm—a particularly appropriate combination, since for many years the slogan of the former concern has been "made like a gun."

We recently inspected this engine, and the slogan came to our mind. Many of our readers have been made familiar with the standard of quality on the Vickers gun, and we can say that the new Enfield engine is as well made. There is nothing radically new in the design; rather it is an engine following conventional practice, but of absolute refinement and finish. It has a mechanical oil pump driven off one of the camshafts—a very neat little piece of mechanism containing but a few parts. The bore and stroke are 85.5 and 85 mm. respectively (964 c.c.). The framework of the machine remains practically as before.

The Lightweight Model.

Easy as is the Royal Enfield lightweight to "paddle off," there are times when owners have wished for a kick-starter, which apparently has been regarded as a difficult proposition with the Enfield gear. However, the company have overcome this without undue complication.

It is interesting to know that, like the big twin, the Royal Enfield lightweight is one of the lightest machines in its class. It scales approximately 147 lb.



The newly-designed Enfield 8 h.p. twin engine.

A 1,000 c.c. Sidecar Machine.

The Hazlewood Co. adopt an 8 h.p. J.A.P. Engine for their New Passenger Outfit.

AS was to be expected after a successful year's trading, all the well-known features of Hazlewood machines have been retained for 1921. Nevertheless, such considerable additions and modifications have been made that the latest models present quite a new appearance. Perhaps the most striking machine is the 8 h.p. J.A.P.-engined passenger outfit, on which the changes that immediately catch the eye are the saddle tank covering a straight top tube frame, the new spring seat-pillar, compound action Druid type forks, and 28×3in. tyres. A choice of either chain and belt or all-chain drive is provided, and in the latter case a spring shock absorber is fitted to the rear hub. Of course, the Hazlewood three-speed countershaft gear and cork insert clutch is retained, also the large flat brake drum on the rear wheel.

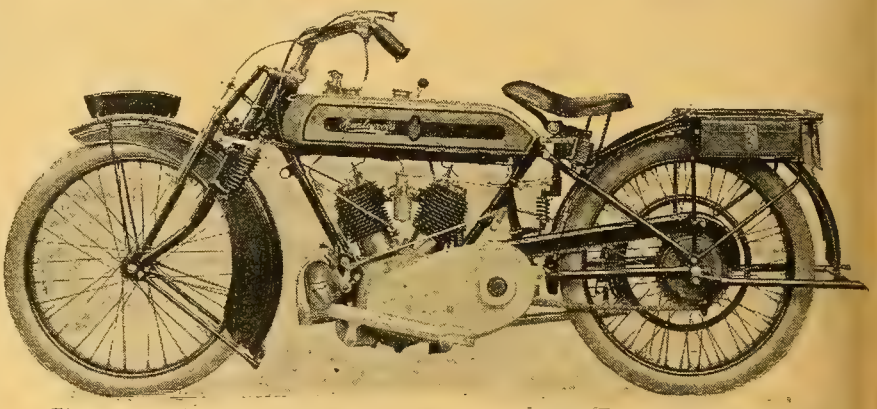
Detail Improvements.

The silencer is held in position by the two bolts which support the large footboard castings. Excellent mudguards are fitted, and the magneto is provided with a special metal shield. Detail improvements include steel castings for all the main frame lugs, and a very smart finish in black and grey. The sidecar provided for this imposing machine is a new production by Messrs. Mead and Deakin, and is finished in grey to match the machine. As in previous years, the two front attachment lugs incorporated with the head are reinforced by a special strengthening plate, which also simplifies the process of attachment.

A smaller model, fitted with the new 6 h.p. J.A.P., conforms more nearly to previous Hazlewood models, since the curved top tube is retained. In this case 650×65 mm. tyres are fitted, and a lighter Canoelet sidecar is attached. With these exceptions the smaller machine resembles the 8 h.p. type in practically every detail.

For the solo enthusiast, the 6 h.p. Hazlewood is specially modified, and in this instance is provided with footrests instead of footboards, a hand-controlled clutch, and a brake pedal set in a particularly convenient position.

Every make of machine worthy of its name has its own peculiarity, and the distinguishing feature of all recent Hazlewood models is a certain sturdiness of construction which gives the impression of great strength without excessive weight. The machine is most practical in every respect, though a few will be apt to criticise the retention of foot clutch control for the standard models. This, however, can be altered to suit the needs of those who prefer hand control, and there are still many who prefer a clutch pedal on passenger machines.



The 8 h.p. Hazlewood sidecar outfit is altered in several details, and fitted with 3in. tyres.

The Ariel "Big Single" Outfit.

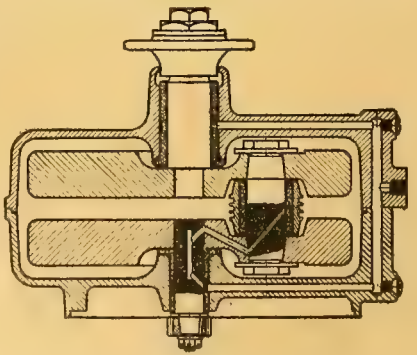
A Full Touring Sidecar Machine with a 4½ h.p. Engine.

OF the several models marketed by the Ariel Co. since they first entered the motor cycle field, probably the best known is the 3½ h.p. single, which has performed consistently well in competitions in both solo and sidecar classes.

It is as a sidecar outfit, however, that it has earned the greatest praise, due chiefly, perhaps, to the fact that as such it has attracted attention by competing against machines of twice the capacity. Latter-day trials have become so stiff that, one by one, 500 c.c. sidecars have dropped out, leaving the Ariel almost alone in representing this economical type of dual-purpose machine. This it did so well that in many quarters it was thought it would be "the last to go," but the introduction of the new 4½ h.p. single indicates that in future the 3½ h.p. sidecar will only be entered in competitions by private owners. The "3½" will still be made, but, automatically, it ranks more as a solo mount, since the latest Ariel catalogue does not offer a sidecar for use with it.

The increase in the size of the cylinder from 86.4×85 mm. (498 c.c.) to 86.4×100 mm. (586 c.c.) has not been made in order to obtain better speeds than were possible with the smaller mount, but rather to make it essentially a sidecar machine with all the comforts of a big twin without the higher cost of this latter type of machine. Thus we have a specification including 28×3in. tyres, a 2½ gallon tank, chain drive, and large sidecar, such as the average dual-purpose mount cannot propel satisfactorily.

Durability is a very desirable point in a sidecar machine, and apparently the designers of the new Ariel have had this in view in working out the details. One has only to glance at the large frame, the substantial nature of the lugs, and the spring fork to appreciate this; while, when the construction of the engine and such parts as the fork links and the hubs are examined, one must agree that it has been designed for hard service.



Note the large diameter (1⅛in.) plain bearing at the driving side of the new Ariel. The diagram shows the oilways.

Plain Bearings Throughout.

The driving side mainshaft is 1⅛in. in diameter and, like the opposite shaft and the big end, runs in phosphor bronze bearings of ample dimensions. At every point the question of lubrication has been given the closest attention, and does not stop at the engine, but is well carried out in the hubs and fork links. A feature of the latter is that each link is built up permanently with one of the bolts. These are drilled to take a charge of lubricant from an oil gun.

The lubrication of the hubs is carried out in a similar manner, and provision is made to retain a good quantity of oil within the barrels, on which there are no lubricators.

As on the smaller single-cylinder model, a decompressor is fitted to facilitate starting, and the exhaust lifter is dispensed with. The gear box is the same as has been fitted to Ariels for some years, but the top gear ratio of 4⅝ to 1 appears to be rather high when the size of the engine, the weight of the machine, and the 28in. wheels are considered.

Messrs. Jelley's Saddle Co., Coventry.

Dear Sirs,

"I should like to say how much I like your patent 'Flexo' Saddle that you supplied me with for my 'Levis' Motor-Cycle 7 months ago. I have just completed 3,000 miles, and it has given me entire satisfaction throughout. I have been over some very rough roads and I have not felt the jar from road shocks like you get from some saddles. I think it is the best saddle I have ever had, and it has kept its original shape.

Yours faithfully, M.R.S. BRAY.

Next Week's Show Report.

The big issue of the year—a fully illustrated description of all the motor cycle exhibits at Olympia.

Weights.

A reminder to makers of lightweights: Prospective purchasers will ask exhibitors for definite information regarding the weight of the machines.

A 3½ h.p. Martinsyde.

A smaller edition of the 6 h.p. Martinsyde, rated as 3½ h.p., will be shown at Olympia. It has a V twin engine, all chain drive totally enclosed, and an exceptionally neat frame with a sloping top tube.

Of Interest to Overseas Readers.

In the last issue of each month *The Motor Cycle* usually includes a section referring particularly to matters relating to motor cycles for overseas. In this issue the feature is omitted, as the Show Forecast, in fact, all the Show numbers of *The Motor Cycle*, are of special interest to motor cyclists of other lands.

B.M.C.R.C. Dinner.

It may assist London readers who contemplate attending the B.M.C.R.C. dinner, next Wednesday, to know that they may obtain tickets from Mr. W. Pratt, the manager of Maudes' Motor Mart, 100, Great Portland Street, W.1.

NEXT THURSDAY!

THE MOTOR CYCLE

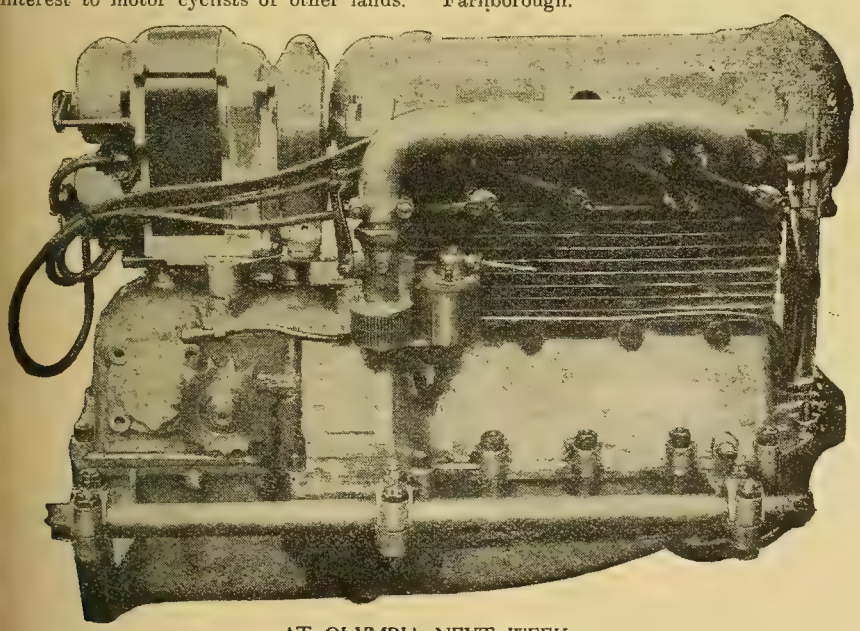
SHOW REPORT.

A stand-to-stand description of th exhibits at Olympia, written and illustrated by "The Motor Cycle" staff, will appear in the next issue. Of enlarged size, this Olympia Show Report Number will be preserved for years to come.

Order a copy early! 4½d.

Assistance Wanted at Christmas.

Any motor cyclist who is open to help the organisers of the London-Exeter run is invited to communicate with Mr. B. Alan Hill, Apsley Fellows Road, South Farnborough.



AT OLYMPIA NEXT WEEK.

Undoubtedly one of the novelties of the Show will be the four-cylinder Superb motor cycle, the first British four-cylinder to be exhibited at the Motor Cycle Show since the days of the T.M.C. The illustration depicts the power unit, which has an overhead camshaft and a *monobloc* aluminium cylinder casting.

HOW TO GET TO OLYMPIA.
WHAT THE SHOW WILL REVEAL.
OPEN LETTER TO THE TRADE.

320 M.P.G.

A second petrol consumption test was made by the makers of the Levis last Saturday, which was officially observed by the A.C.U. with a standard 211 c.c. Levis, weighing 129¼ lb. and a rider of 117 lb. Geared 5½ to 1 and averaging a speed of 21.6 m.p.h., the consumption worked out at the rate of 245 m.p.g. Another machine, weighing 131¾ lb. with a rider of 151 lb. and geared 5⅞ to 1, covered fifty-four miles at 21.6 m.p.h. on a consumption equivalent to 320 m.p.g. Standard Amac carburetters were used.

Trial for Sutton Cup.

On Saturday last the Sutton Coldfield and North Birmingham A.C. held a reliability trial on the lines of the Colmore Cup Trial of 1912. The organisers planned a main road course, such as is covered by the average tourist, and the main idea was to prove how much modern machines have improved since pre-war days. At the time of going to press the official awards had not been made known, but the following made non-stop runs:

B. Kershaw (2¾ Verus), A. W. Thrush (4 Triumph), W. H. Riley (6 A.J.S. sc.), J. Roberts (3 A.B.C.), L. Paynter (3½ Norton), F. Giles (6 A.J.S. sc.), L. Newey (6 Ariel), T. F. Blumfield (6 Ariel sc.), F. A. Watson (3½ Sunbeam sc.), L. H. Brown (8 Acme sc.), H. Morgan (8 Morgan), Gus Kuhn (2¾ Verus), and B. L. Bird (2¾ Marloe-Blackburne).

The following cars also qualify for non-stop awards.

Seymour Smith (10 Humber), B. Harcourt (20 Austin), Dr. C. H. Harcourt (14 Angus-Sanderson), S. H. Roe (10 A.C.), and Geo. Bedford (9.7 Hillman).

The London-Exeter Run.

Over fifty entrants have already been received for the M.C.C. annual Christmas-tide run to Exeter. These include the following riders:

SOLO MACHINES.

A. C. Rhodes (3½ N.U.T.), H. B. Browning (3¾ Scott), R. C. Staunton (4 Triumph), C. E. Hagenbach (4½ Humber), J. F. Hull (2¾ Wooler), L. W. G. Gotley (2½ Omega), L. Keevil (3½ Sunbeam), George Brough (8 Brough Superior), C. A. McKeand (4 Harley-Davidson), E. O. Brodin (3 A.B.C.), G. Richardson (2¼ Velocette), L. R. Richardson (——), H. F. Fellows (4 Sunbeam), B. Silver (4½ Quadrant), J. C. Walker (2¾ Edmund), B. E. Belfield (3 A.B.C.), P. Street (3½ Sunbeam), F. A. Longman (2¼ Wooler), B. F. C. Fellows (2¼ De Dion), C. Bourlet (3½ Ariel), J. I. Anderson (3½ Sunbeam), Lt. V. Belfield (3 A.B.C.), W. G. Boyer (5 Rover), Capt. C. D. Michalis (6 Zenith), Harold Karslake (5 Brough), and F. W. Stevenson (3½ Brough).

PASSENGER MACHINES.

E. Kickham (3½ Douglas), Eli Clark, jun. (6 Douglas), S. J. Marks (4 Triumph), Ian Macdonald (7-9 Indian), P. W. White (8 Sunbeam), Rev. E. S. Powell (6 A.J.S.), E. Atkins (3½ Ariel), O. P. C. Collier (8 New Imperial), J. L. Roy Jensen (7-9 Harley-Davidson), W. A. Fell-Smith (8 Rex), Flt.-Lt. C. B. Cooke (5-6 James), R. B. Whiffen (8 Blackburne), Wilfred C. Hemy (6 A.J.S.), H. W. Holmes (10 Morgan), Clifford Wilson (4½ Quadrant), L. Arnold (8 Matchless), J. G. Goodenough (8 Zenith), R. Newitt (7-9 Harley-Davidson), R. A. Rayner (6 A.J.S.), Capt. H. F. O. Evans (4½ Humber), W. H. Julian (8 Matchless), Lt. G. D. Daly (7-9 Indian), H. A. Reyre (6 James), F. W. Giles (6 A.J.S.), D. H. Noble (7 A.J.S.), G. L. Speeson (2½ Connaught), and G. L. White (5 Rover).

Entries close definitely on December 8th.

CLUB NEWS.

Ystalyfera and Swansea Valley M.C.C.

A reliability trial over a circular course was held by the above club on Thursday, November 11th. A speed-judging competition was incorporated in the trial. Best performance of trial: T. P. Lewis (2¼ Levis), error 1m. Lightweight prize: T. P. Lewis (2¼ Levis). 500 c.c.: D. E. Rees (3½ Sunbeam), error 6m.; B. J. Lydden (3½ James), error 6½m.

West Kent M.C.

The winter session of the above club opened on Saturday, the 13th inst., with a speed-judging competition. The course included many of the Kentish test hills, and was about thirty miles in length. The result was based on the aggregate time error at the secret check and at the finish: 1, M. Welch (3 A.B.C.), error 5m. 10s.; 2, G. Jessop (8 Imperial-Jap sc.), 5m. 42s.

Gorseinon and District M.C.C.

The above club held its first open reliability trial on November 13th. The course was around Gower, a thirty-three miles non-stop run. The roads were in a very bad state, but nevertheless some very good performances were made. The final results are now to hand, and are as follows:

1 (silver cup), J. Thomas (3½ Norton sc.); 2 (gold medal), T. P. Lewis (2¼ Levis); 3 (silver medal), D. Jones (2¼ Juno).

Cambridge University M.C.C.

The following are the results of the speed trials run off at Thetford recently. Timekeeping was carried out by Mrs. Knowles, the well-known trials rider:

300 c.c. CLASS.—1, J. L. Giles (2¾ Omega), 52 m.p.h.; 2, K. D. Bates (2¼ Triumph), 38.7 m.p.h.; 3, Sefton Jones (2¾ New Imperial), 33.7 m.p.h.

350 c.c. CLASS.—1, J. V. Prestwich (2¾ Nut-Jap), 64.7 m.p.h.; 2, S. J. Bassett (2¾ Douglas), 57.1 m.p.h.; 3, C. A. McKeand (2¾ New Imperial), 55.9 m.p.h.

500 c.c. CLASS.—1, T. J. Wright (4 Indian Scout), 66.2 m.p.h.; 2, J. V. Prestwich (3½ Nut-Jap) and H. W. Rice-Evans (3½ Norton) tied, 64 m.p.h.

600 c.c. CLASS.—1, T. J. Wright (4 Indian Scout), 65.7 m.p.h.; 2, H. W. Rice-Evans (3½ Norton), 63.5 m.p.h.; 3, J. McLeod (3½ Sunbeam) and J. A. G. Dent (4 Triumph) tied, 55.9 m.p.h.

750 c.c. CLASS.—1, F. W. Ayreton (5 Zenith), 58.2 m.p.h.; 2, H. St. V. Norman (Nut-Jap) and J. A. G. Dent (4 Triumph) tied, 55.9 m.p.h.

UNLIMITED CLASS.—1, G. Rae-Arnot (7-9 Harley-Davidson), 72.2 m.p.h.; 2, A. S. Brereton 7-9 Harley-Davidson), 69.2 m.p.h.; 3, T. J. Wright (4 Indian Scout), 68.2 m.p.h.

SIDECAR CLASS (under 600 c.c.).—1, O. G. Smart (4 Norton sc.), 53.3 m.p.h.; 2, H. B. Howson (4 Norton sc.), 50.9 m.p.h.

UNLIMITED SIDECAR CLASS.—1, M. H. Rollason (7-9 Harley-Davidson sc.), 59.4 m.p.h.; 2, Saunders Davies (7-9 Indian sc.), 57.1 m.p.h.; 3, W. G. Sykes (8 Zenith sc.), 55.9 m.p.h.

Colchester and District M.C.

The official results of the Colchester and District Motor Club's speed event held at Lexden on November 11th, over a course of half a mile (fifty yards flying start), are as follows:

CLASS 1. Solo up to 350 c.c on formula.—1, L. Weatherell (2½ R.W. Scout); 2, A. E. Clark (2¾ Douglas); 3, R. W. Tracey (2¼ Royal Enfield).

CLASS 2. Solo up to 500 c.c.—1, A. E. Clark (3½ Norton), 32⅘s.; 2, R. W. Tracey (3½ B.S.A.), 35⅗s.; 3, R. Weatherell (2½ R.W. Scout), 39⅘s.

CLASS 3. Sidecar up to 650 c.c.—1, T. S. Wilkin (4 Norton sc.), 34⅘s.; 2, A. Medcalf (4 Norton sc.), 37⅘s.; 3, A. E. Clark (3½ Norton sc.), 37⅘s.

CLASS 4. Sidecar up to 750 c.c.—1, R. Charlesworth (5 Zenith sc.), 34s.; 2, T. S. Wilkin (4 Norton sc.), 35s.; 3, A. Medcalf (4 Norton sc.), 38⅘s.

CLASS 5. Sidecar, unlimited c.c., on formula.—1, R. Charlesworth (5 Zenith sc.); 2, A. E. Clark (3½ Norton sc.); 3, T. S. Wilkin (4 Norton sc.).

CLASS 6. Solo up to 650 c.c.—1, T. S. Wilkin (4 Norton), 31s.; 2, A. Medcalf (4 Norton), 32s.; 3, A. E. Clark (3½ Norton), 33s.

CLASS 7. Solo up to 750 c.c.—1, R. Charlesworth (5 Zenith), 28⅘s.; 2, T. S. Wilkin (4 Norton), 29s.; 3, A. Medcalf (5 Zenith), 31⅗s.

CLASS 9. Sidecar ridden by veterans over 40, on formula.—1, A. G. Simpson (5 Rover); 2, F. Medcalf (4 Norton); 3, G. Lloyd (3½ B.S.A.).

FASTEST TIME OF DAY.—R. Charlesworth (5 Zenith), 28⅘s.

A collection taken on the course raised a considerable sum for local hospitals.

Warrington M.C.

On Saturday, November 6th, this club held motor cycle speed trials on a private road at Catten Hall, Kingsley, by kind permission of C. T. Sproston, Esq. The event was particularly well attended, attracting 107 entries for the various classes. The results have now been announced, and are as follows:

CLASS 1a. Expert and General. Solo Machines up to 350 c.c.—1, S. A. Crabtree (2¾ A.J.S.); 2, Geo. Cowley (2¾ A.J.S.); 3, S. Eastwood (2¾ Royal Ruby).

CLASS 1b. Expert Barred. Solo Machines up to 350 c.c.—1, L. C. Crabtree (2¾ A.J.S.); 2, S. Eastwood (2¾ Royal Ruby); 3, I. Bernard (2¾ Sunbeam) and E. M. Brown (2¾ Douglas) tied.

CLASS 2a. Expert and General. Solo Machines up to 500 c.c.—1, T. Simister (3½ Norton); 2, G. E. Cowley (3½ Norton); 3, H. R. King (3 A.B.C.).

CLASS 2b. Expert Barred. Solo Machines up to 500 c.c.—1, H. R. King (3 A.B.C.); 2, G. F. Burns (3½ Sunbeam); 3, L. C. Crabtree (2¾ A.J.S.).

CLASS 3a. Expert and General. Solo Machines up to 600 c.c.—1, G. E. Cowley (3½ Norton); 2, T. Simister (3½ Norton); 3, S. A. Crabtree (3½ James).

CLASS 3b. Expert Barred. Solo Machines up to 600 c.c.—1, H. R. King (3 A.B.C.); 2, E. S. Abram 3 A.B.C.); 3, S. A. Crabtree (3½ James).

CLASS 4a. Expert and General. Solo Machines of Unlimited c.c.—1, T. Simister (3½ Norton); 2, H. R. King (3 A.B.C.); 3, E. S. Abram (3 A.B.C.).

CLASS 4b. Expert Barred. Solo Machines of Unlimited c.c.—1, E. S. Abram (3 A.B.C.); 2, H. R. King (3 A.B.C.); 3, L. C. Crabtree (2¾ A.J.S.).

CLASS 5a. Expert and General. Sidecar Machines up to 750 c.c.—1, G. E. Cowley (3½ Norton sc.); 2, T. Simister (3½ Norton sc.); 3, S. A. Crabtree (3½ James sc.).

CLASS 5b. Expert Barred. Sidecar Machines up to 750 c.c.—1, S. A. Crabtree (3½ James sc.); 2, A. J. Bailey (3½ Norton sc.); 3, J. Massey (6 Royal Ruby sc.) and H. A. Bleckly (6 Bradbury sc.) tied.

CLASS 6a. Expert and General. Sidecar Machines of Unlimited c.c.—1, G. E. Cowley (3½ Norton sc.); 2, T. Simister (3½ Norton sc.); 3, F. Bolton (7-9 Indian sc.).

CLASS 6b. Expert Barred. Sidecar Machines of Unlimited c.c.—1, J. M. Bullough (8 Dot sc.); 2, J. Massey (6 Royal Ruby sc.); 3, F. Bolton (7-9 Indian sc.).

SPECIAL AWARDS.—Fastest A.J.S. prize, L. C. Crabtree; fastest Douglas prize, E. M. Brown; fastest Sunbeam prize, G. F. Burns; fastest A.B.C.

Dublin and District M.C.C.

The annual general meeting of the Dublin and District M.C.C., held recently, attracted a large attendance of members. The election of club officials for next year resulted as follows: President, S. L. Hutchinson; vice-presidents, Messrs. Doolin, Wallen, Curtis, Kelly, Waters, Dunphy, and the President of the Cork M.C.C. Working Committee, Messrs. Carton, Grimes, Allen, Browne, McAllister, Carvill, Humpreys, Smith, and Walsh; secretary, W. H. Freeman; treasurer, P. H. Hurse (both re-elected); honorary solicitor, P. Grimes; honorary auditors, Messrs. Doolin and Carton; club captain, Major J. A. H. Waters. The annual dinner has been arranged for a Saturday early in December.

Sheffield and Hallamshire M.C.C.

The Bisby Trophy trial was held on November 6th, over a very sporting course of thirty miles, a good half of which could be described as representing Colonial conditions, being over the hills and dales of South Yorkshire. After an exciting afternoon's sport the results worked out as follows:

1, G. W. Wilkin (2¾ Wilkin), who takes the trophy for one year and replica; 2, C. E. Turner (3½ Triumph), club gold medal; 3, J. O. Vessey (4 Triumph) and E. Searle (3½ Norton) tied, club silver medal each; 5, C. W. Ward (3½ Norton), silver spoon; 6, F. W. James (Morgan), silver spoon.

R. Stacey wins the captain's prize for the first sidecar to finish; and C. E. Turner wins the hon. secretary's prize for the first ex D.R. to finish. R. Stacey and E. Wheatley win the hon. trials secretary's prize for the nominated pair to finish with most marks.

The Club Cup trial was held on November 14th, over a very hard course of 105 miles in South Yorkshire and Derbyshire, included in which were six observed hills, and one watersplash which ran about nine inches deep. Results:

1, E. Wheatley (4 Triumph), cup for one year, replica, and gold medal; 2, C. W. Ward (3½ Norton), gold medal and one tankard; 3, E. Sneath (3½ Wilkin), gold medal and one tankard; 4, L. Padley (4 Triumph) and E. A. Ward (4 Triumph) tied, two tankards each; 6, J. O. Vessey (4 Triumph), one tankard; 7, F. W. James (4 Triumph), one tankard. E. Wheatley also takes the prize of a silver spoon for the best performance on Hunger Hill.

A DAY OF SKIDS.

THAT he would not go round again for £50 was the verdict of a finisher in the Leicester and District M.C.C. Trial for the Lunt and Pascell Cups on November 14th.

However, the fact that Master A. Bowerman (aged 14 years) on a Velocette successfully completed the course to a very slight variation from schedule, proves that it was not at all an "impossible" event.

Out of a representative entry of eighty-two, seventy-two started and forty-three finished—many as much as half-an-hour late, however. It was long after lighting-up time before the last man got in.

It was a day of spills, and the solo competitor who could number his skids on the fingers of one hand was a rarity.

The hairpin at Amergate was the scene of an unfortunate accident, where W. Athwell (4 Douglas sc.), after making a splendid climb, found trouble in some ruts, and, running off the road, fell several feet. His sidecar passenger was rather severely hurt.

The two A.B.C.'s were prominent in the acceleration test on Rowsley Bar, while the Nortons and Triumphs ran very consistently throughout. H. Bashall (6 Martinsyde sc.) made an exceptionally good show until he tried conclusions with a brick wall near Green Hill. The latter precipice proved the undoing of many, but the A.J.S. and Matchless outfits were almost all good.

The results are not yet to hand, but Bowerman's performance will probably gain him a special award.

D45

COMBINING IGNITION AND LIGHTING.

The New M-L Maglita for Single-cylinder Motor Cycles of any Size.

A DEVELOPMENT of great importance to motor cyclists, and one which should make a very wide appeal, is represented in the new electric lighting and ignition system known as the M-L Maglita. After many months occupied in testing the equipment in the laboratory and on the road, the M-L Magneto Co., Ltd., of Coventry, have now standardised the outfit in a form rendering it suitable for single-cylinder machines with either two-stroke or four-stroke engines.

The set, which can be fitted readily to existing machines, comprises two units beyond the usual head and tail lamps. The first is a combined magneto and dynamo capable of being substituted for the ordinary magneto, the second is a combined battery and switch unit, which displaces the generator of acetylene lighting systems and occupies very little more space.

Gearing Eliminated.

An outstanding feature of the magneto and dynamo unit is the fact that it has only one rotating member; there is no gearing whatever. This rotating member is an H section armature with a low-tension winding, and a two-part commutator which rectifies the alternating current first generated, changing it to a continuous current suitable for battery charging or lighting the lamps.

There is no interconnection between the lighting and ignition circuits, so that any accident to the lighting circuit cannot affect the ignition, and yet, in effect, the machine is similar to one employing two separate armatures with gearing between them. Further, the ignition system is quiet independent of the battery; if the latter should be run down or even removed the engine can be started and run normally, and efficient lighting obtained so long as the engine is running.

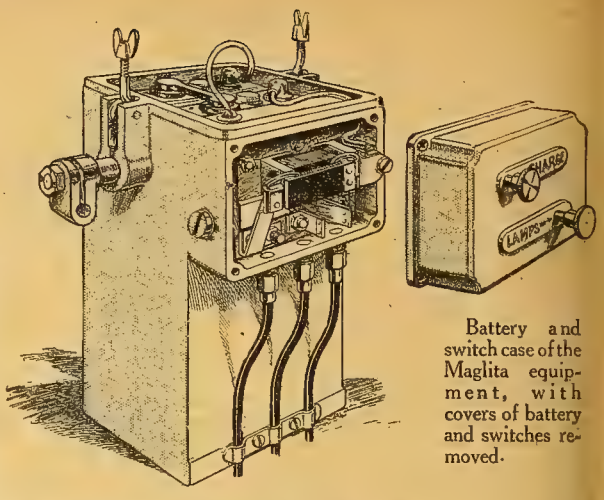
Current for ignition purposes is generated by the low-tension and high-tension windings being wound round a stationary laminated iron core which forms a bridge between the upper ends of one of the two pole shoes of the machine, the ignition windings thus being placed in the magnetic circuit. The rotation of the armature causes changes in the direction of the magnetic flux, and these changes are employed to produce the ignition current.

The contact breaker of the ignition system is stationary, the face cam which actuates it being mounted on the armature and operating to break the circuit at the correct moment; it serves to make the change of flux in the magnetic circuit so sudden as to produce a high-tension current of ample strength to cause a spark to occur at the plug.

Great Accessibility.

While an exceedingly compact and simple machine has been designed on these lines, the parts which may require occasional attention are peculiarly accessible. The commutator and the contact breaker are both brought immediately into view by removing a flanged dust cover which encloses the end of the machine. The brushes of the commutator are of compressed copper carbon, and can be instantly removed for examination or replacement by lifting and moving to one side the flat steel springs which bear upon their outer ends.

In place of the usual rocking lever for the contact breaker is a triangular member of spring steel, secured to the frame of the machine at its two upper corners by screws and carrying one of the contact points at its lower end. This end, when the face cam operates, is pushed away from the fixed contact point, making contact again subsequently when the cam moves on. There are no small springs or carbon brushes, and the contact points can be adjusted or removed with an ordinary magneto spanner.



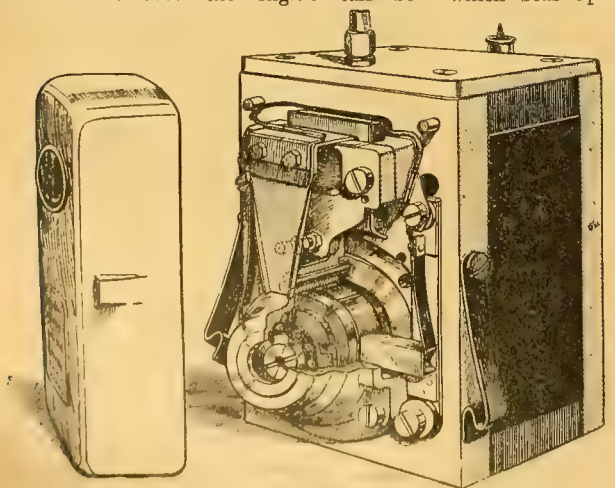
Battery and switch case of the Maglita equipment, with covers of battery and switches removed.

Stationary Condenser and Contact Breaker.

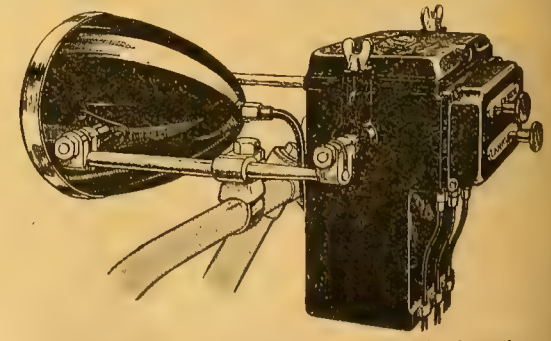
The condenser and the contact breaker are mounted together as a single unit, which can be removed as a whole, if desired, without disturbing any other portion of the machine, merely by detaching two screws.

To provide the armature speed necessary to give sufficient current for lighting purposes, the armature is run at engine speed. The machine is therefore not only eminently suitable for two-stroke engines with their normal gearing, but when applied to four-stroke engines the higher armature speed ensures a considerably better spark for starting than is provided by the ordinary magneto run at half-engine speed. The idle spark produced on alternate strokes of four-stroke engines occurs during the exhaust period, and prolonged trials have demonstrated that this spark is then quite harmless.

The combined battery case and switchboard consists of an aluminium unit carried at the rear end of a bracket on the handle-bar, the front end of the same bracket carrying the head lamp. The switch gear is enclosed in a compartment



Part sectional view of the Maglita combined generator and magneto, showing the commutator of the lighting circuit, also the face cam, insulated thrust pin, and spring steel blade of the ignition contact breaker.



Maglita head lamp, bracket, and cases containing batteries and switches.

The test-hill record regained

ON Tuesday, November 16th, at the first ascent the test—hill record was regained by Captain A. F. Nash on the G.N. racer "Kim," of 1086 c.c.

TIME 9·37 SECONDS.

This performance gives an average speed, from a standing start, of 25·63 miles per hour up an average gradient of 1 in 5·027.

The start was made on the 1 in 8 gradient, which changes to 1 in 5, and ends with 150 feet of 1 in 4.

Details of the G.N. Touring, Legere and Vitesse models will be sent with pleasure on application.

G.N. Ltd., East Hill, Wandsworth, London S.W.18.

An average of 25·63 up 1 in 5 from standing start.

Raymond.

Combining Ignition and Lighting.—

behind the battery, and the push-in switch controls are therefore immediately in front of the rider. There are two switches, one comprising a combined charging and reverse current switch, the other being for the head and tail lamps.

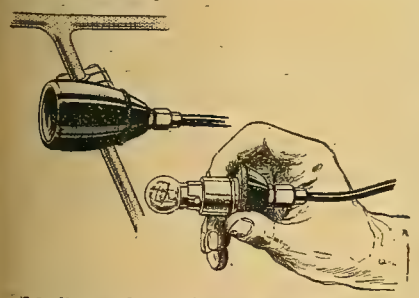
Special features which will be greatly appreciated are embodied in the charging and reverse current switch. In the first

The special cable terminal used in Maglita set provides waterproof wiring and firm contact for "earth" return through metallic sheath of cable.

place, if it be closed (pushed in) it will not remain so but will automatically open (return to the "off" position) if the engine is stationary or be stopped. Thus, it is impossible for the battery to be discharged inadvertently through the generator windings. The switch consists of a permanent magnet and an armature wound with a coil of wire in the charging circuit. The armature may be moved by hand with the switch plunger; but, if the engine is stationary, current flows from the battery to the generator, opposes the action of the magnet, releases the armature, and allows the switch contacts to separate again.

Automatic Dimming Device.

The armature of the switch also takes effect upon a pair of auxiliary contacts so arranged that when the switch is open ("off") the head lamp is automatically dimmed. The current consumption is therefore reduced very considerably when the engine is stationary, and when, obviously, the full amount of light is not needed. Further, the fact of the head lamp being dimmed reminds the rider when he starts the engine again that he should close the charging switch so that the battery may not be run down, as it would be if he ran for several hours, or on a number of successive occasions without recharging it.



Maglita rear lamp; the lampholder is detachable for use as inspection light.

The generator alone, without assistance from the battery, provides enough current to light both head and tail lamps fully while the engine is running at or above 20 m.p.h. In normal running, therefore, the battery is not drawn upon, but serves to provide current at low speeds and when the engine is standing.

Lamps and Wiring.

The standard set is made for use with four-volt lamps using a 2 amp. 8 watt bulb in the head lamp and a ½ amp. 2 watt in the tail lamp; on sidecars a third light with another ½ amp. bulb can be fitted.

The wiring is extremely simple, and is on a concentric system with an earthed return; but the latter consists of the black-coated metallic sheathing of the single insulated cable, and is not dependent upon the return current finding its way through the frame of the motor cycle. Waterproof gland terminals secure the cable sheath firmly where it enters the machine, battery box, and lamps, and, apart from its simplicity, an advantage of this system is the fact that it is impossible to connect the generator wrongly or reverse the polarity. No special tools, merely a screwdriver and a small spanner, are required to make the connections, and no soldering is necessary.

The battery is specially made to meet motor cycle requirements, and the acid cannot be splashed over while running. Its capacity is 12 amp. hours, and it is capable of giving five hours' light with the machine standing without the engine running.

An outstanding practical merit of this system of lighting and ignition lies in its compactness and convenience, as well as in the fact that it is eminently suited for fitting to existing machines as well as to new ones. It has been submitted to a series of lengthy road tests on even the smallest of two-stroke and four-stroke lightweights, while it can equally well be applied to single-cylinder machines of any size, either solos or sidecars.

To Suit any Engine.

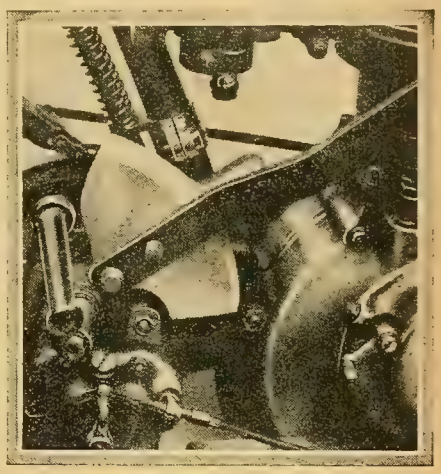
Although only the single-cylinder outfit is referred to in the foregoing, the M-L Co. has already adapted the system to flat twin engines, while models for V twins are being designed, but will not be ready for some little while.

Maglita sets will be fitted by several motor cycle manufacturers to machines which they will show at Olympia, and the system will be thoroughly demonstrated on the M-L Co.'s stand. Bulk supplies will be available in February next, we understand.

The efforts which are now being made to provide efficient apparatus for electric lighting at a moderate cost suggest that motor cycles in the future, like present-day cars, will be sold to the public "ready for the road," and with no necessity for irritating extras.

FOR OLD STURMEY GEARS.

A DEVICE for protecting the quadrant mechanism of the old type Sturmey-Archer gear box from the ill effects of mud and dust, as well as guarding it from petrol overflow, which washes out the lubricant and often causes sticking, has been marketed by Mr. H. Birch, Coton Road and Princes Street, Nuneaton.

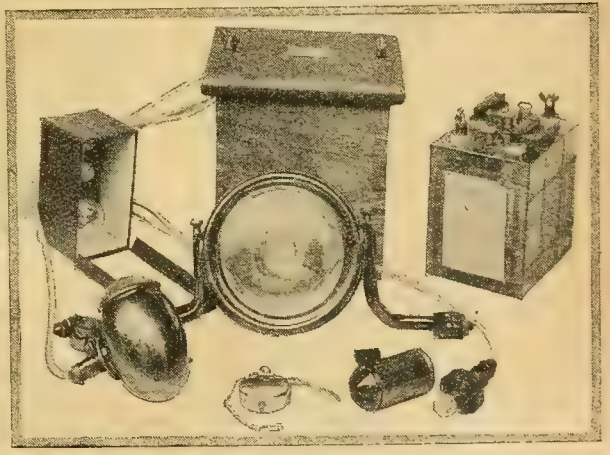


The Birch gear box quadrant cover.

A PRACTICAL LIGHTING OUTFIT.

AN extremely practical lighting set is now being handled by Messrs. Godfreys, Ltd., 208, Great Portland Street, London, W.1. It consists of a six-volt accumulator in a teak box, a handsome head lamp provided with brackets for any handle-bar, a torpedo side lamp, and a tubular tail lamp, the back of which is made detachable, so that it can be used as an inspection lamp. Sufficient armoured cable is also supplied.

The necessary switches themselves are incorporated in the bayonet fitting in each lamp in which the bulbs are carried.



Godfrey's accumulator lighting set for sidecar outfits.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters must be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

BENZOLE-PARAFFIN MIXTURE.

Sir,—In reply to Mr. Sharp, who asks what size jet, and what carburetter I used with my benzole-paraffin mixture, I may say that I used a standard Triumph carburetter with a No. 32 jet. The only objections I find to this mixture are (1) the smell, and (2) the fact that I have since found it carbons up the cycle much more. C. C. KING.

SIGNPOSTING IN TOWNS.

Sir,—The subject of signposting in towns raised by Mr. Cyril C. Twiss is of real importance, and if *The Motor Cycle* will move the local authorities to improvement it will prove another claim to our gratitude.

Intelligent "blazing" would in many towns divert through traffic from overladen centres: this is done successfully in Kidderminster and Loughborough.

A motor cyclist stopping to ask the way increases congestion often where traffic is heaviest. E. SIMPSON.

GOLF BALL V. MOTOR CYCLE.

Sir,—The question raised in your issue for the 11th inst. as to the winner of golf ball *v.* motor cycle match is decidedly interesting. It is not generally realised that a well hit golf ball covers, say, the first 100 yards of its flight at an amazing velocity, and I am quite confident that the motor cyclist would have to maintain a speed of 90 m.p.h. over the distance of 250 yards at least to tie with the golf ball. I can imagine some difficulty in arranging the contestants to start together.

Whitley Bay. SCRATCH.

BABY ON TOUR.

Sir,—*Re* letter and photograph of "Starting Early," published in *The Motor Cycle* of October 28th, I may mention that my son was taken in the sidecar when seven weeks old, and covered over 2,000 miles before six months. My husband being one of the first despatch riders in the war, is a great motor cyclist, therefore I am an enthusiast also, and like father like son. My husband still relies on the Triumph, as he did for years in France.

My experiences are the same as those of the previous writer, that while the machine was at a standstill baby was not at all pleased. I have had my boy christened after that great motor cyclist, Eric Williams. During our trips this year, the old 'bus, as my husband terms it, has not failed at anything, and we have not had a mechanical defect of any kind. (Mrs.) D. WILLIAMS.

SERVICE.

Sir,—May I tell you my experience? Six months ago I bought a sidecar outfit. After a few short and pleasant runs, I went to Scarborough. Arriving there I found my front spindle nuts were loose, and took the cycle to a garage to have them looked at. I called for my machine for the return journey, and had not gone more than five miles out when the spindle wore completely in two and let me down, through the garage man having put the wheel in the wrong way round. My machine was laid up five weeks at a cost of £5. I started again, but found in a week or two that my back cones and cups were done; again I took it to a garage, and was promised it in three days. That was on September 9th. I have not got it yet. After having parts sent that did not fit, I sent the wheel to the makers. I have not received it yet, and have no idea when it will come. It appears to be lost on the railway. A machine without a wheel is no use to

A POOR MAN.

Guiseley.

HAND SIGNALLING.

Sir.—"BY 6617" is all right so far as he goes, except where he says that "an overtaking vehicle going straight on has the right of the road over a vehicle ahead of him who wishes to cut across the former's path into a side road."

If "BY 6617" is an old cycle racer he will remember that no overtaking rider might cut in in front of a man he had passed until he was a clear length in front. The leader might swing right across the track if he liked—and did so on certain shapes of banking without reference to who was behind him, as he was forbidden to look round.

The road is of course not quite the same. The leading rider can and should look round before attempting to turn across the road, but (here is my main point) the overtaker has no right to come up with or pass anyone, and especially opposite a cross road or side turning, without satisfying himself that the man in front is aware of his proximity. Large and silent cars are probably the worst offenders in this respect, and it is quite easy when swinging a yard or two to avoid a pot-hole, to put one's self in danger of which one has not the least suspicion. OLD 'UN.

Leeds.

A HINT TO CLUB SECRETARIES.

Sir,—Now the year is drawing to a close, and club secretaries will be drawing up programmes for 1921, may I give them a hint which might increase membership. There are quite a lot of keen riders who, like myself, find it quite impossible to go in for Sunday runs, or to attend events held on Saturdays. There is badly needed a mid-week series of trials. Personally, around here I know a lot of keen young motor cyclists who are free on Wednesday afternoons, or who can occasionally get off for a week-day trip, who belong to no club, and who would much like to belong to one. Take the nearest local clubs to this town. All their events are on Saturdays and Sundays, and so many who would join do not do so.

Much also could be done in the way of short evening runs and competitions in the summer months. No provision seems to be made in this way, so that a hint may be useful. This last summer I organised an informal sort of club on these lines, and we had ideal sport on several occasions. Is the matter worth enlarging on? R. C. MEASURES.

Northfleet, Kent.

MORE CONSUMPTION FIGURES.

Sir,—May I take the liberty of giving you a few details respecting the running of a 1920 P. and M.?

I took delivery of this machine (solo) on Easter Saturday, and before leavng the shop had fitted a fairly heavy Millford sidecar.

I have run 3,749 miles on various mixtures of petrol and benzole, petrol alone, and benzole alone, but I find I get best results by far on benzole.

I give you the averages as follows: 3,749 miles on forty-seven gallons of spirit, equal to 79.71 m.p.g.; 3,749 miles on five gallons B.B. oil, equals 749.8 m.p.g.

I weigh 9½ st., my passenger 10 st. I consider this a very satisfactory record. Oil may be rather heavy, but I have not been sparing with this, and consider I have got the benefit by the smooth and even running of the whole outfit under all conditions experienced.

The only trouble I have had was a link break in the back chain and becoming locked in the forward end of the chain case; and, of course, this can happen to all riders.

R. F. WHITLEY.

CONCENTRIC WIRING FOR ELECTRIC LAMPS.

Sir,—With reference to "Ixion's" paragraph in a recent issue concerning concentric wiring for electric lamps, I may say that I was troubled in the same way and tried, first of all, twin flexible wire, metal braided, but this was not a success owing to the braiding becoming damaged and eventually wet perishing the cable insulation.

I have for the last two years used cab tyre sheathed cables. The particular type which has been in use on my motor cycle consists of two rubber insulated flexible wires laid side by side and covered by the cab tyre sheathing, which, in addition to being an ideal protection from burning oil, rough usage, etc., is, in itself, an excellent insulator, so that troubles likely to occur at night on the roadside, owing to defects in the wiring system and shorting, are practically non-existent.

It is extremely flexible and quite easy to work with, the outer sheathing peeling off without any difficulty or damage to the inner conductors, provided the rubber is cut with a sharp knife and ordinary care taken. The complete cable is approximately the same size as the usual H.T. wire.

I hope this information may be of some use to motor cyclists who, like myself, ride in all winds and weathers, and at any time of the night.

I may add that the wire appears to be in as good condition as the day I installed it and it has never failed me.

Llanelly. Y 9062.

AN A.B.C. TIP.

Sir,—Doubtless other riders of the A.B.C. machine have experienced the same trouble as myself after a period of usage, *i.e.*, the tendency for the gear lever to jump into neutral when placed in the top gear notch.

This tendency is doubtless brought about by wearing of the dogs, and the only permanent remedy is to have them renewed. As a temporary measure, however, the lever may be kept in its place by looping one end of an elastic band, bought at a stationer's, over it, the other end of the band being stretched over a nut or other projection at the rear of the gate. I was compelled to do something to stop the lever jumping in the manner described during a recent trip of 200 miles on business and hit on this plan. The same band, which is still intact, has done duty for over 600 miles in all, and never once has the gear lever jumped out of the notch since it was fitted. The tension can be varied by stretching the band to a greater or less extent, *i.e.*, over an object closer to or further away from the quadrant, and when this has been determined it will be found that all four gears can be engaged and the movements of the lever not interfered with in the least.

This is the sum trouble met with in 4,000 miles riding in all weathers and all classes of roads. Not bad for such a "complicated machine with so many little parts to go wrong," as the critics will have it.

As a matter of fact, I have found the A.B.C. one of the most reliable mounts I have ever owned in fifteen years riding.

It is certainly one of the fastest, and practically vibration less. OH211.

Bedford.

FRONT WHEEL BRAKES AND SKIDDING.

Sir,—Doubtless the majority of motorists will be in accord with the views expressed by Mr. Dufton in his article on "Brakes and Skidding," published in your issue of November 4th. Many drivers have had the unpleasant experience of their car swinging completely round and proceeding in the reverse direction, owing to the injudicious application of brakes on a greasy road surface.

But Mr. Dufton appears to forget that the use of the front brake on a motor cycle, ridden solo, is an entirely different thing, and its probable behaviour in various circumstances is a thing not demonstrable by the use of small models. Here the rider depends for his stability on the free movement of his front wheel, any tendency to lean to either side being corrected by a movement of the steering head in the same direction, the balance being thus preserved. If, however, the front wheel be locked by the brake, the turning of the bars, say, to the left, immediately causes the lower part of the front wheel to skid to the right, and the balance is at once considerably upset.

I have only twice had to use my front brake on greasy surfaces, each time to avoid a collision with a careless horse driver, and on two different machines. The result to myself was identical in both cases—a heavy fall.

K. C. HIBBS.

TORQUE AND COMFORT.

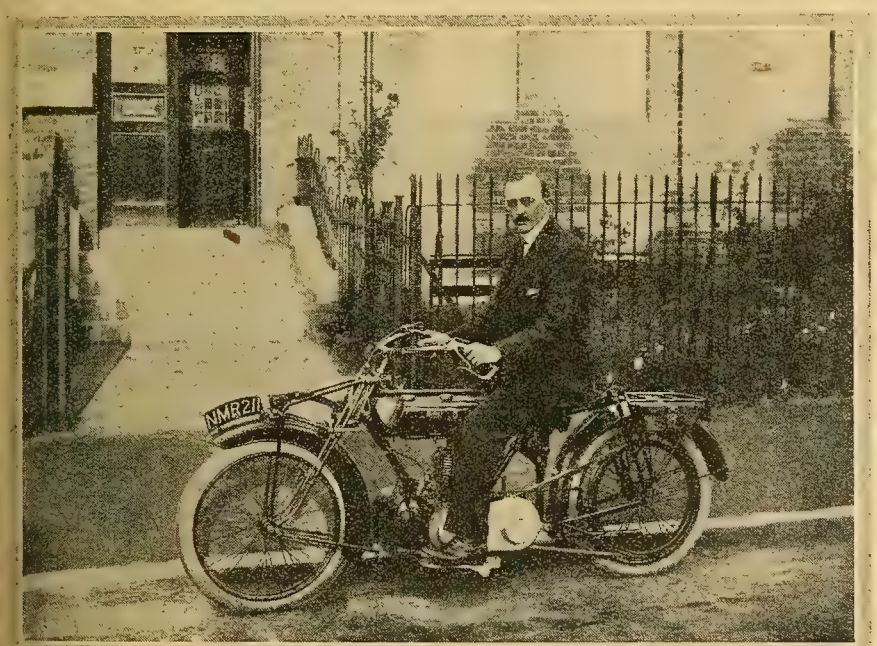
Sir,—I have read Mr. A. Newsham's letter upon "Torque and Comfort," and venture to give my opinion concerning his engine. The double-acting I.C. engine raises many interesting problems, but its added complications, such as cooled pistons, piston rod glands (if required), coupled with increased weight of reciprocating parts, are decided drawbacks for motor cycles. The "unbalance" makes a twin engine a necessity, preferably a 90° twin with cranks at 90° to get both balance and even torque.

Possibly Mr. Newsham is aware that high-speed steam engines are generally, with one notable exception, single acting? Nevertheless, I wish him every success, as a practical double-acting engine would revolutionise the motor industry.

With regard to the "Sans Magneto" problem, the action is possibly that of the Hornsby-Ackroyd oil engine, the fuel being vaporised by a hot cap in constant communication with the cylinder (in this case probably carbon supplies the necessary heat) and fired by the temperature corresponding to a compression pressure of 40 lb. per square inch (in the original engine).

R. C. STEBBING.

[The balance of a 90° twin engine with cranks at 90° is not ideal, though a reasonable compromise can be effected. Perhaps Mr. Newsham would be prepared to forward drawings to illustrate the principles on which his double-acting engine is designed, either for publication or confidentially, as a matter of interest?—ED.]



A popular rider, Hugh Gibson, outside the new offices of the Royal Ruby Works, on his mount, a 3 h.p. spring frame Royal Ruby. Mr. Gibson is best known for his prowess on Bradbury and Clyno machines. During the past ten years he obtained many notable successes, including the English and Irish End-to-end journeys, and other fine performances in England, France, and Holland.

RUNNING EXPENSES.

Sir,—From time to time I have seen expense accounts in your valuable paper, and I thought that the following particulars may be of interest to your readers.

I would like to mention one or two facts first. The cycle is a second-hand 1919 4½ h.p. B.S.A. with Cooper sidecar, Binks carburetter, and Lucas dynamo lighting. Accounts date from November, 1919, to November, 1920. I had never ridden a motor cycle or driven a car before November, 1919, consequently all repairs were at first effected by garages. For the first six months I had no home or fixed garage, but was moving about the country. A great number of tours were carried out in very hilly country (Devon and Cornwall) with passenger and luggage, and in all weathers. The following are the final figures :

Total expenditure (excluding capital and depreciation), £95 18s. 10d.
„ miles, 6,819.
„ gallons of petrol, 114.
„ gallons of oil, 7.
Miles per gallon, petrol, 59.81.
Miles per gallon, oil, 974.

The expenses were made up as follows :

	£	s.	d
Petrol	19	10	11
Oil	3	16	2
Tyres and repairs	15	2	4
Repairs and maintenance	37	0	1
(Includes strengthening C springs to take luggage, £2; new main bearing, £3; new sidecar axle, and mudguard fixed to body, £3 7s. 6d.; new belt rim, £2 2s. 6d.; chassis repair, £2 15s.; two sidecar spring breakages previous to strengthening and new belts.)			
Garage	8	6	3
Sundries	12	3	1
(Includes insurance, A.A. and A.C.U. subscriptions, tax, maps, etc.)			
	£95	18	10

Total cost per mile, 3.37d. Oil, petrol, and tyres cost 1.35d. per mile.

TYRES USED.

	Miles.	
Wood-Milne extra heavy, 3/12/19 to 9/4/20, back wheel	2,273	
Wood-Milne re-tread, 26/7/20 to 27/7/20, back wheel (beading weak)	22	
Dunlop heavy, 2/2/20 (unfinished), sidecar	6,000	(to date)
Palmer Cord extra heavy, 9/4/20 to 10/6/20, back wheel	1,219	
Palmer Cord extra heavy, 10/6/20 to 9/10/20, front wheel	2,253	
Palmer Cord extra heavy, 8/6/20 to 26/7/20, back wheel	1,435	(bad cut)
Palmer Cord (repaired), 9/10/20 (unfinished), front wheel	400	(to date)
Dunlop extra heavy, 27/7/20 (unfinished), back wheel	1,660	(to date)

I hope these expenses and particulars may be of interest to some, and I trust that next November you will allow me to submit a new and probably better set of accounts. In any case the tyre record should be of more interest by then.

Bristol. E.W.

NAKED DRIVING CHAINS.

Sir,—*Re* "Ixion's" comment on chains, I should like to bring to his notice my experience with a naked chain.

I bought my machine in April of this year. It was second-hand, and am afraid I cannot say how old the chain was when I took it over. Since then I have run it about 5,000 miles, 1,500 of which were covered by a tour in Devonshire and Cornwall, and there are some places there where a chain is subjected to no mean strain. I refer to Lynton and Porlock, and the going from Penzance to Land's End, to mention but a few. Returning home, when just out of Oxford, the nuts of the rear hub somehow worked loose. The wheel, which is held in position by chain adjusters of the push bicycle variety, pulled out, and the wheel became so jammed that I was unable to shift it. The chain had wound itself round the driving sprocket and jammed so hard that I had to get a hammer and chisel and hack the spring link away to relieve it, and, consequently, the wheel. This chain is still giving excellent service, and looks like lasting several journeys yet. The chain is a Hans Renold, and the cush drive the Enfield patent, attached to my 6 h.p. Enfield combination.

If "Ixion" knows anything about this district he will, I have no doubt, know that the riding is by no means all plain sailing, and therefore realise that the test of this chain is, if anything, above the average call on any chain.

I use Prices' (?) "shaving stick" graphite for lubrication, and once boiled the chain in fat before going on the aforementioned tour. I always keep it adjusted, and if it gets bright on a journey put some engine oil on. N.E.A.

Bradford.

Sir,—We have noted "Ixion's" comments in your issue of the 11th inst., with reference to naked chains, and, as requested, we are passing on our remarks on the subject.

Obviously, the ideal method of lubricating a chain is by means of an oil bath gear case, as fitted to the Sunbeam; but, as you are aware, many makers fit cases which are merely chain covers, and unless the chain is periodically attended to by a conscientious owner, they are more dangerous than when the chain is running exposed, and can, consequently, draw the owner's attention to its condition by its appearance.

In our experience, the best method of lubricating a protected or open chain is to take a dish such as an old roasting dish or similar shallow receptacle, and place in it a quantity of Price's "Rangraphine" or Atcheson's "Gredag," which is warmed up to melting point. The chain, which has previously been cleaned in paraffin, or some similar liquid, is then immersed in the molten lubricant and allowed to soak for five or ten minutes, the lubricant being just kept at the liquefying point. These compounds have not the peculiar smell associated with molten tallow, and we do not think that Mrs. "Ixion" will have further cause of complaint.

Home-made mixtures of tallow and graphite we cannot recommend, as our experience has been that the particles of graphite are not generally fine enough to percolate into the inner bearing areas of the chain, and, consequently, while the outside looks as though everything has received a most excellent coating of grease and graphite on the inside, the reverse is the case.

Trusting this will clear your contributor's mind on the subject, HANS RENOLD, LTD.

SUMMARY OF CORRESPONDENCE.

Three readers have recently added their testimony to the usefulness of A.A. membership.

Apollo No. 1 plugs have given great satisfaction to Mr. W. A. E. Featherstone, of Edgbaston, Birmingham, who writes us to this effect.

The following garages have recently received strong recommendations from various correspondents: Messrs. Smallpiece, Milford; Phillips, Bridgend, Glam.; Rice Bros., Horsham; Sandham Engineering Co., Gray's Inn Road, London; S. Lewis, Great Portland Street, London; Howe, Walsingham; Baxter, Fakenham; and the Holborn Depot of the James's Cycle Co.

And the following manufacturers gain entirely unsolicited testimonials for their fair and prompt business methods: The Triumph Cycle Co., Coventry; the Clyno Engineering Co., Wolverhampton; the Albion Engineering Co., Birmingham; the Wooler Engineering Co., Hayes; the Coventry Eagle Cycle and Motor Co., Coventry; Bayliss, Thomas, and Co., Tyseley; Hanwell, Sons, Components, Ltd., Northampton; W. E. Brough and Co., Nottingham; Auto-Carriers, Ltd., Westminster; E.I.C. Magnetos, Ltd., Birmingham; the London Speedometer Co., Earls Court; Sturmey-Archer Gears, Ltd., Nottingham; and several other firms, mentioned, however, by anonymous correspondents.

BOOKS AND MAPS FOR MOTOR CYCLISTS

Issued in conjunction with *The Motor Cycle*.

	Price net.	By post.
"MOTOR CYCLES AND HOW TO MANAGE THEM." The standard handbook on the motor cycle. Covers every subject relating to all types of motor cycles, their management and care. Twenty-first Edition. Just published	2/6	2/10
"HINTS AND TIPS FOR MOTOR CYCLISTS." Containing over 400 useful "wrinkles" and helpful hints in regard to motor cycles. Seventh Edition.	2/-	2/3
"TRACING MOTOR CYCLE TROUBLES." A reliable system for tracing motor cycle faults and of remedying any trouble when found. Fourth Edition.	2/-	2/3
"THE MOTOR CYCLE" ROAD MAPS. England and Wales. Scotland. London (showing roads into and out of London and avoiding London). Mounted on linen. Set of three, complete in case.	5/6	5/10
"THE MOTOR CYCLE" ROUTE BOOK. With 32 pages of Road Maps of England and Wales, Scotland, and the London District. New Edition. Just published	5/-	5/4

Obtainable by post (remittance with order) from ILIFFE & SONS Ltd., 20, Tudor Street London, E.C.4, or of leading Booksellers and Railway Bookstalls

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C.4, and whether intended for publication or not **must be accompanied by a 2d. stamped addressed envelope for reply.** Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

"Some" Exhaust Pipe.

The exhaust pipe fitted to my machine has no silencer, but is over 3½ yards long and 1½in. diameter. Is it necessary to fit a silencer, or does this length of piping suffice within the Motor Act? —W.G.

If the machine is reasonably silent, it is perhaps unnecessary to fit a silencer. The requirements of the law are not quite clear on the point. The chief thing, however, is that the machine must not create an objectionable noise, and we think that with the pipe you have fitted (if it really *is* 3½ yards, and not feet!) your machine should be in order.

Recognising an Engine.

I have bought a Villiers two-stroke, the engine of which is said to be a 1920. How can I prove that it is a 1920? and how can I assure myself that it is a Villiers?—H.W.

Your best plan to ascertain the date would be to submit the engine number to the makers. Features of the majority of Villiers engines are as follows: There is a sharp angle in the exhaust pipe where it branches out from the cylinder, the name is usually cast on the magneto chain cover, and two silencers are fitted, one behind the other. Also, if it is a 1920 model, the lubrication is by drip feed to one of the front engine bolts, which is hollow and has a special union incorporated for the oil pipe.

Effect of Extra Air Inlet.

My machine is a Rudge, with Senspray carburetter, and the makers recommend a 40-42 jet, but even with a 38 jet I can use full air at all speeds and throttle openings. It would appear that I need more air for speeds above 20 m.p.h. I have tried a slightly smaller jet, but the engine does not develop enough power and gets rather warm. Even then the carburetter takes full air at all speeds, and, in short, seems to function as an automatic one instead of "semi-automatic." Do you recommend an "extra air intake," and what size jet should I use?—H.F.T.

The Senspray carburetter works almost automatically, and provided you get reasonably good consumption with the 38 jet, we do not recommend you to alter it or fit an extra air inlet. As your machine is a Rudge, however, if you wish to try the effect of admitting extra air you can open the injection tap on the inlet dome.

A Question of Liability.

Early in this year the pistons of my 6 h.p. twin were smashed, and I took the machine to a repairer to have the whole engine overhauled in March. It was not returned until July. I was not at home when the machine was delivered, but when I first tested it I found that the timing was far from correct, and that the compression was not nearly so good as it should have been. Then I took the machine to the nearest recognised agent of the make of cycle, and asked them to dismantle the engine and put things right. This firm has given me a written statement that they found: (1.) That no washers had been placed between the joints of the crank case and cylinders and between the portions of the crank case. (2.) That the cylinders were $\frac{1}{32}$in. from being properly set on the crank case. (3.) That the big end bushes were slack. (4.) That the crank pin was worn. (5.) That several engine bolts were not the correct size. (6.) That spring washers were omitted where necessary and fitted where unnecessary. The bill for the first overhaul amounts to £8 3s. 3d. The second overhaul was £3 9s. 2d. I will be obliged if you will give me your advice regarding liability for the first repairer's account. —J. McD.

We gather that the whole of the second bill of £3 9s. 2d. is due to the negligent way in which the repairs were done at first. We therefore think that you would be justified in deducting the £3 9s. 2d. from the £8 3s. 3d., but rather than have an action over the matter it would be best to come to some settlement. It would certainly be best to pay the difference straightaway, as if the garage proprietor started proceedings for the £8 3s. 3d. he would be entitled to costs up to the time the amount is paid into court.

IMPORTANT DATES.

Nov. 29th.-Dec. 4th—
Olympia Motor Cycle Show.

Dec. 10th-19th—
Brussels Show.

Dec 27th.28th—
M.C.C. London-Exeter Run.

Jan. 28th to Feb. 5th, 1921—
Scottish Motor Exhibition, Kelvin Hall, Glasgow.

Using Waste Oil.

In order to prevent oil from dropping from the waste pipe of the crank case while my motor cycle is standing in the garage, I have fitted a shaving stick tin. This has put the idea into my head as to whether it would be possible (by fitting a larger receptacle) to catch the oil whilst running, and use it again, or would the lubricating properties be so deteriorated as to make it detrimental to the working parts of the engine?—W.G.

It would not be advisable to use again the waste oil which you catch from the release valve of the engine; at any rate, you should not use it for engine lubrication, but there should not be any harm in using it for other purposes, such as spring fork bearings or wheel bearings.

Use of a Variable Jet.

Would you please give me advice as to how to get the most satisfactory results from a variable jet adapter? I have failed, probably from inexperience, to get good running from a two-lever carburetter fitted to a 6 h.p. twin. No instructions were sent with jet, and every adjustment I tried gave thumpy running. At last I set it to just turn over the engine with quarter throttle and air full off. This practically turns it into a one lever carburetter, as it will run the engine satisfactorily with the throttle lever only, the mixture at this setting not needing any extra air unless the throttle is fully open. I do not know if this is the correct method of using the adapter, but I am continuing it until I find a better, as it saves me the trouble of a second lever; and as far as I can tell by rough experiment the engine is running cooler than when I had a fixed 28 jet that took nearly full air. Why this should be so I do not know?—BINGO.

The chief advantage of a variable jet adapter is that it enables carburetter tuning (by varying the size of the jet) to be carried out while the engine is running. Of course, there is probably only one position which will give the best all-round satisfactory results, and no doubt those which you have obtained show that you have found this position. Probably an air leak in the induction system accounts for the curious behaviour of your carburetter; if this is so, its cure should be coincident with an increase in the amount of air which may be given at low speeds.

Suitability of Gear Ratios.

I have a 1919 5-6 h.p. outfit with gear ratios varying between 3½ and 7 to 1, and in view of your statement in a recent issue that a 3½ or 4 to 1 top gear on a Triumph would be useless, I beg to ask if you consider my machine to be too highly geared? For instance, while touring in Devon recently I could not get up Porlock, and put the reason down to the fact that my lowest gear was much higher than on other machines of the same power. At the same time, I manage to negotiate all the district around North London (except one or two really steep hills) on the 3½ to 1 top gear. Should I reserve such a high gear for down grades only?—H.F.T.

A gear of 3½ or 4 to 1 is much too high for ordinary running with a sidecar outfit, although it may be used under favourable conditions. Very few machines, irrespective of power, are geared higher than 4½ to 1 on top for sidecar work.

A Sales Transaction.

I left my motor cycle at a shop to be sold. The agent let it go without first getting the money (£70). The buyer left his motor cycle, value £40, with the agent as security. I have sold this £40 motor cycle with the owner's consent. Should I claim the balance owing (£30) from the agent or the buyer? Would it matter whether the agent had ever obtained the balance from the buyer if my claim is on the agent? All my transactions in this affair have been through the agent.—L.G.

Apparently you did not insist on the agent selling the motor cycle for cash, and approved of, or acquiesced in, the agent selling it for credit, because you afterwards allowed the other motor cycle to be sold and accepted the £40 on account. We do not think you have any claim at all on the agent, unless you can show that the agent has received the £30 from the purchaser. We therefore recommend you to sue the purchaser for the balance due to you.

EXPERIENCES WANTED.

M.W. (Paignton).—1920 4¼ h.p. B.S.A., solo and sidecar; consumption, mileage of chains, and maximum gradient climbable with passenger in sidecar.

J.A.P. (Kirkwall).—Grado multi-pulley on 3½ h.p. machine with sidecar; reliability, belt slip and belt wear.

RECOMMENDED ROUTE.

LONDON TO LAND'S END (VIA SOUTHAMPTON AND COAST).—T.E.

Kingston-on-Thames, Cobham, Guildford, Godalming, Milford, Haslemere, Henley, Midhurst, Cocking, Singleton, Lavant, Chichester, Havant, Cosham, Fareham, Titchfield, Botley, Southampton, Totton, Lyndhurst, Lymington, Melton, Christchurch, Boscombe, Bournemouth, Poole, Wareham, East Stoke, Wool, Proxwell, Osmington, Weymouth, follow coast road to Bridport, Lyme Regis, Seaton, Beer, Sidmouth, Newton Poppleford, Clyst St. Mary, Exeter, Exminster, Dawlish, Teignmouth, Shaldon, Torquay, Brixham, Dartmouth, Stokenham, King's Bridge, Modbury, Plymouth, Saltash, St. Germans, East and West Looe, Pelynt, Fowey, St. Blazey, St. Austell, Tregony, Truro, Penryn, Helston, Marazion, Penzance, Land's End.

The two machines on the left are the Levis two-strokes which underwent an officially observed petrol consumption test recently. The fuel consumption worked out at 164 m.p.g. and 226 m.p.g. respectively. The trial was reported in last week's issue.

J. L. Emerson Joins Zeniths.

The well-known rider, J. L. Emerson, who has been so long connected with the A.B.C. motor cycle, and whose performances on this make have been extraordinarily good, is now employed by Zenith Motors, Ltd., Hampton Court.

Gear Conversions.

In view of the numerous applications received by Messrs. Hazlewoods, Ltd., Albion Mills, Coventry, from riders of Hazlewood motor cycles fitted with three-speed hub gears requiring them to be converted into gear box models, the company is now undertaking to carry out such modifications.

P. and M. Repairs.

The numerous riders of P. and M. motor cycles in London and the Home Counties will be interested to learn that the makers of these machines have recently taken over spacious repair works in the West End of London, where all repairs and overhauls can be carried out. The office address is 4, Berners Street, Oxford Street, W.1.

Improving the Sidecar.

In our issue of September 23rd last, we referred to a new design of sidecar chassis as the Bachelier. It appears that the proprietors of this chassis are the United Aircraft Co., Ltd., of Gosport, Hants. A further description of the United Aircraft Co.'s chassis appeared in our issue of the 21st ult., and we are desirous of correcting any misapprehension there may be as to the ownership of the chassis.

A French Water-cooled Motor Cycle.

During the Show week, two new types of Viratelle motor cycle, a 3½ h.p. single and a 6 h.p. vertical twin, will be shown at Messrs. Burt's Motors, 245, Hammersmith Road, London, W.6. The machines, which are equipped with water-cooled engines, have also ingenious three-speed gears and spring frames. We understand that the makers, La Société Française des Motoreyclettes et Automobiles Viratelle, Lyons, are prepared to license the manufacture of these machines in Great Britain and in the Colonies.

An Alteration of Title.

Messrs. James Thomson and Son (Motor Factors), Ltd., who amalgamated with Messrs. Brown Brothers, Ltd., in 1919, have now decided to change their title to Messrs. Thomson and Brown Brothers, Ltd., under which title all Messrs. Thomson's branches situated in Aberdeen, Edinburgh, Glasgow, Leeds, Newcastle, Birmingham, Dublin, and London will be known. Messrs. Brown Brothers, Ltd., original title will not be affected, but the words, "with which is amalgamated Thomson and Brown, Brothers, Ltd.," will be added.

Burlington
Motor Cycle Co, Ltd.

OUR STAND

will not be found inside Olympia, but we extend a cordial invitation to all our friends to visit us at our Temporary Showrooms opposite Olympia Main Entrance. We shall have on view, amongst other goods, samples of our reconstructed Motor Cycles,

2¾ H.P. DOUGLASES, 4 H.P. DOUGLASES,
AND
TRIUMPHS.

Several Models of our BURLINGTON SIDECARS, including our latest model, "Bird-catcher." We shall also be pleased to demonstrate our New Clutch Conversion Set for 4 h.p. Douglases.

DON'T FORGET TO GIVE US A CALL DURING SHOW WEEK!

Temporary Offices and Showrooms: **7, Hammersmith Road** (opposite Olympia). 'Phone; Western 4005.

GENUINE DOUGLAS REPLACEMENTS.

Large quantities of 2¾ and 4 h.p. Spare Parts at miles below makers' price.

TRIUMPH TANKS.

All late pattern, and in good order, but not enamelled (minus fittings) £1 15 0
Carriage and Packing, 3/-.

TRIUMPH FRAMES.—DIAMOND PORTION.

All Re-enamelled .. .. .. each £4
AS NEW. Carriage and Packing, 3/-.

GENUINE TRIUMPH VALVES.

Inlet complete with Spring and Cotter .. 4/-
Postage 9d.

MILLER'S GENERATORS.

Ex W.D., Type 111A, Brand new, each 15/-
List price 27/6. Postage 1/-.

DOUGLAS PATTERN FOOTBOARDS.

2¾ h.p., 12/6 per pair; 4 h.p., 15/- per pair. These footboards are all rubber covered, with brass edgings.

TO 4 H.P. DOUGLAS OWNERS—

Write for particulars of our Clutch Conversion Set, or call and let us demonstrate.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns —First 12 words 3/–, and 3d. for every additional word. Paragraphs of under 8 words are charged double rate. Each paragraph is charged separately. Name and address must be counted. Series discounts, conditions, and special terms to regular trade advertisers will be quoted on application.

Postal Orders and Cheques sent in payment for advertisements should be made payable to ILIFFE & SONS Ltd., and crossed & Co. Treasury Notes, being untraceable if lost in transit, should not be sent as remittances.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," 20, Tudor Street, London, E.C.4, or 19, Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge, which must include the words Box ooo, c/o "The Motor Cycle." Only the number will appear in the advertisement. All replies should be addressed No. ooo, c/o "Motor Cycle," 20, Tudor Street, E.C.4. *Replies to Box Number advertisements containing remittances should be sent by registered post, but in all such cases it is advisable to make use of the Deposit System.*

In the case of motor cycles offered for sale under a box number, as it is unusual for these to be sold without first being inspected by the intending purchaser, advertisers will facilitate business by embodying in their advertisements some mention of the district in which the machine offered may be seen and tried.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but, if not, we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions up to £10, a deposit fee of 1/- is charged; on transactions over £10 and under £50, the fee is 2/6; over £50 and under £75, 5/-; over £75 and under £100, 7/6; and on all transactions over £100, ½ %. All deposit matters are dealt with at 20, Tudor Street, London, E.C.4, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

MOTOR CYCLES FOR SALE.

Clouds of dust, or pouring rain—the "Howard" keeps your mount as bright as new.

Thoroughly waterproof it can be fitted in a few minutes—that's how it saves in space and housing costs.

Strapped to the carrier it makes a really comfortable pillion seat, ready to cover your machine at the first drop of rain.

Any weather, anywhere—your rides are real "no worry" rides with a "Howard"; it lasts indefinitely, and never changes shape.

Your bike needs one before the winter; write us, we can give immediate delivery, As supplied to H.R.H. Prince Henry.

INTEGRITY

LAYTON GARAGES

OLYMPIA.

GENTLEMEN,

I shall be at the forthcoming Show the whole of the week, and will take it as an honour if all our clients and friends—prospective and otherwise—will give me the opportunity of meeting them at the Enfield Stands, where I shall generally be found.

It being true that the greatest factor in the success that has come to us is the courtesy and friendship of our many clients, I ask all our friends—especially those whom we to-day know only by post—to at least give me the opportunity of shaking hands. I earnestly desire to say "Thank you" face to face, and although I shall be heartily glad to quite impartially discuss the machines that we enthusiasts love, I shall under no circumstances press sales.

Looking forward to many happy re-unions, and also to meeting many whose writing we know quite well, but whom distance has prevented our hitherto meeting,

I am, gentlemen,

Yours most gratefully and happily

J. W. TOLLADY,
General Manager.

AN UNSOLICITED TESTIMONIAL

26, Station Road,
Harborne,
Dear Sirs, Birmingham.

The I.T.S. coat to hand. I feel I must write to say how pleased I am with it. The style, cut, and finish, is the best value for the money I have yet seen. I am more than satisfied, and shall certainly recommend your coats to all my friends.

Yours faithfully,
(Signed) C. HOCKLEY.

Made by experts and a firm with a reputation for giving value.

Need more be said

The Forward Aero Plug.
Type S, Price **8/6**

Below we give yet another of the testimonials which come in regularly every day and by every post.

"I have great pleasure in informing you that in the Matchless Cup Open Trial last Saturday, I won the Cup, being the only competitor to do a non-stop. I used your Plug as always, and found it excellent. Your Detachable Aero Plug never dries or oils up, and I can honestly say that never have they let me down.
I used your Fastener as well, which was excellent.

And THAT'S the testimony of the only competitor to do a non-stop run. Need more be said? We think not, except to remind you that you will find us at

STAND 260 Olympia

where you will find all the specialities which "the Motorists that matter" use.

Forward Sparking Plug Co., Summer Row, Birmingham.

Price **1/9**

MISCELLANEOUS.

BINKS Carburetters.—Large stock ready for immediate delivery.—Booth's Motories, Halifax.

BINKS Carburetters.—We specialise in these; all models supplied.—Booth's Motories, Halifax.

BINKS Carburetters.—We take your old carburetter in exchange.—Booth's Motories, Halifax.

BINKS Carburetters for Douglas, Scott, Indians, Harley-Davidsons, Triumphs.—Booth's Motories, Halifax.

BINKS Carburetters enable your engine to tick over; try one.—Booth's Motories.

BINKS Carburetters save petrol and give more power.—Booth's Motories, Halifax.

BINKS Carburetters.—Let us take your old carburetter in exchange.—Booth's Motories.

STATIONARY Engines.—1½h.p., run on petrol or paraffin; list free.—Booth's Motories.

STATIONARY Engines.—3h.p., run on petrol or paraffin.—Booth's Motories, Halifax.

STATIONARY Engines.—Hopper cooled, mag. ignition, 2 flywheels; list free.—Booth's Motories.

STATIONARY Engines.—Large stock for immediate delivery; list free.—Booth's Motories, Halifax.

STATIONARY Engines.—Latest design, run on petrol or paraffin.—Booth's Motories, Halifax.

STATIONARY Engines.—Large stock; send for list; exchanges entertained.—Booth's Motories, Halifax.

100 MAGNETOS, brand new, weather-proof model; £4/17/6, carriage 1/6.—Booth's Motories, Halifax.

175 CARBURETTERS to be sold, cheap; Brown and Barlow, Amac, Capac, B.S.A., Senspray, Triumph, Scott, Douglas; price from 15/-. Several are latest 1920 models, hardly used; state requirements.—Booth's Motories, Halifax. [2908

NEW N.S.U. Gear less Controls, £7; take old one part.—Box 9,503, c/o *The Motor Cycle.* [1265

THE Spot for cheap dependable typewriters.—Reliance House, 2, Gray's Inn Rd., Holborn, W.C.. [1324

STURMEY-ARCHER Gear Boxes, brand new; in stock.—County Engineering Co., Hounslow. 7929

MUDGUARD Blades, extra strong, 5in., front 8/6, back, sidecar or cycle car, 9/-; carriage 9d.

BELT Rims, 19in. or 16in.×2¾in., for 1in. belt, 17/-; carriage 1/-.

WIRE Wheels quoted for.—Front M.C. from 27/6; back M.C., from 36/-; sidecar wheels, from 35/-—Gibbons, Chadwell Heath, Essex. [0111

DOUGLAS Pistons, gudgeons, rings, at large reductions for quantities.—Crow Bros., Guildford. [6054

PHILIPSON Pulley, 1920 model, one month's wear, off Triumph; £7.—Rols, Banstead, Surrey. [1247

J.A.P. Spares (genuine) large varied stock; expert J.A.P. overhauls.—Crow Bros., Guildford. [6055

1919 Tank, silencer off 2¾h.p. Douglas, ready new; offers.—Wright, Riverside, Nottingham. [X1942

POLISHED Celluloid Sheets.—Athol Engineering Co., 9, Peru St., Higher Broughton, Manchester. [7962

SADDLE, Brooks B170, as new, 35/-; motor horn, 10/-.—78, Eversleigh Rd., Battersea, London. [1068

MABON Pulley Clutch, 1920, as new, complete, off Triumph; £4/4.—Lincoln, 38, Mere St., Diss. [1067

12 NEW Renolds ⅝×¼ Chains, 100 links, 30/- each Bran, 20, Farlton Rd., Earlsfield, S.W. [9844

GRADO Kick Start, £8/10; Douglas shaft, 35/-; piston, 10/-.—Box 9,504, c/o *The Motor Cycle.* [1266

LATHE, 6½in., S.C.; exchange cheap motor cycle, or sell £12.—31, Capstone Rd., Bournemouth. [9676

CHAIN, Renold, ⅝×¾, 93 links, splendid condition; 26/-.—Wright, Bannerley, Coleshill, Birmingham. [9972

ARMSTRONG and Sturmey-Archer Gears repaired while you wait.—County Engineering Co., Hounslow. [9626

STURMEY-ARCHER Countershaft Gear Box for sale.—Ideal Trading Syndicate, Cromwell House, Holborn. [1630

DOUGLAS Spares: Gear box, engine spares, etc. Write requirements.—62, Southfield Rd., Bedford Park. [9634

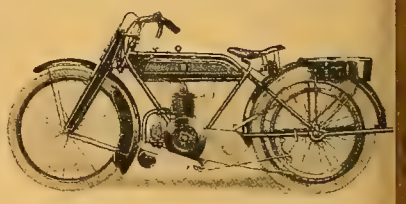
UNIVERSAL Utility Motor Cycle Locks, cheaper than insurance and more handy, 8/9 each.—Below.

MARVULC Vulcaniser, cheaper and better than any other, 8/9 each; extra patches and fuel blocks, 3/- dozen.—I.D.A., Ltd., 3, Central Buildings, Westminster, S.W.1. [0324

RIMS, 28×3 or 28×2½, brand new, ex W.D., drilled 40 hole, also drilled to take belt rim; 7/6 each.—Below.

BRAKE Rims or Belt Rims, diameter 16in., width 2½in., brand new, ex W.D.; 8/6 each.—Marble Arch Motor Exchange, 135, Edgware Rd., W.2. [8555

The Priory



Manufactured by Motor Cycle experts, "Priory" is ideal for the solo rider who demands reliability at reasonable cost.

2¾ h.p., 2-stroke, 2-speed. Engine fitted with dual pipes. Many other features of interest. Write for illustrated Booklet.

Price- - - - £66 - 10 -
Kick Starter Model £75 - 0 -

Agents wanted everywhere in United Kingdom and Abroad.

Olympia in 1920.

IT would indeed be a fastidious motor cyclist who failed to find his ideal at Olympia. Hundreds of machines ranging from miniature motor cycles, a natural development of the scooter, listed at an attractive figure, to the lavishly equipped motor bicycle for solo and sidecar use are staged for inspection. Their resplendent finish calls for general admiration, though possibly the glitter of the Show models possesses less of a glamour to experienced riders than plated parts do for beginners. This week's exhibition at Olympia is supported by British, American, French, Belgian, and Swiss manufacturers. Though international in character, British productions easily predominate, as indeed the British motor cycle industry leads in this the finest and most exhilarating pastime in the world. It can be said, too, that the magnificent display is in every way commensurate with the importance the industry has attained during its twenty years' existence. One should appreciate that the motor cycle industry represents one of our most staple trades. British exports of such machines equal two million pounds annually, besides which we find a market in this country for nearly half a million pounds worth of motor cycles of foreign construction. Thus it will be observed that from small beginnings the motor cycle manufacturing world has grown to big proportions, and finds employment for many thousands of workers.

Definite Improvement.

It has been said that the majority of 1921 models at the Show conform largely to 1920 design. As a general remark this may be true, but novelty and evidence of definite improvement are by no means absent. Where this year's Show differs notably from last year's is in the *proved* examples of machines displayed. Though conforming in outward respects to those exhibited last year, one need not delve deeply into the parts that matter to discover innumerable traces of advance and refinement, which all spell increased pleasure and reliability. Difficult and prolonged road tests have placed their hall mark on many comparatively untried designs which made an initial appearance at the last Olympia Exhibition. Nor should these remarks be confined to motor cycles and sidecars alone, since electrical equipment—notably lighting sets—in particular reveals marked progress. The convenience of being able to switch on a reliable lamp of indefinite life has to be experienced to be believed by those who recall struggles with lamps in the past. Comfort—a subject which has received much attention in these columns—has very noticeably been studied. If spring frames are not so numerous as one would wish, saddle-springing devices are greatly in evidence.

An Attractive Range of Exhibits.

Two and four-stroke lightweights in profusion at very tempting figures, replete motor bicycles and sidecars as well as "permanent" three-wheeled runabouts which nowadays defy wind and weather, combine to render this year's Show unusually attractive. Even sidecar taxis form a feature, though one forms the impression that some of the designs have been over-developed. Nevertheless, the sidecar taxis and the trade sidecarriers form an interesting sidelight upon the many possibilities of the inexpensive motor cycle and sidecar, now developed to a remarkable degree of reliability.

A wave of economy is passing over the whole world, and consequently the cheapest form of motoring is bound to attract—and receive—an increased measure of attention. All interested in the popularisation of economical motoring and the development of the motor cycle for the million should visit Olympia this week and examine for themselves the best machines available in 1921; those who find it impossible to do so will find a fitting substitute in *The Motor Cycle* Show Report, which has been written after a personal inspection of the exhibits.

An Index to the advertisements in this issue will be found on the page facing the back cover.

Occasional Comments

By "Ixion"

First Impressions of the Cedos.

I HAVE just started my winter pottering on a Cedos lightweight, and shall naturally wait to see if it plays me any vicious tricks before recording my mature impressions. But I was delightfully surprised at the outset to find how beautifully it two-strokes down to very low road speeds, and not less so when driven light downhill. I have not previously owned a two-stroke which was its equal in these very vital points.

The Pot-hunter.

A FRESH sidelight is thrown on "colonial" routes for one day trials by a letter to hand from a club secretary. He complains that local riders are swamped in these events by professional pot-hunters, and that the organiser's best plan for ensuring a prize or two to the local men is to include a lot of freak hills which want knowing. This is quite sound sense. But I dissent from overmuch opprobrium being handed out to the so-called "pot-hunters." Most of them are traders of one sort or another, whose business it is to advertise the machines which they handle. The amateur pot-hunter is really rather a rare bird, since the expense—not to mention the nervous strain—of habitual trial riding is too heavy an outlay to be faced for the sake of a few medals.

Carrying the Spare Chain.

AN Aussie film-runner—which I take to be a man who conveys the reels from one cinema to another—sends me a panegyric on the trusty Triumph, in which he mentions that he stores his spare rear chain in a locker specially made and fitted beneath one of the footboards. Incidentally, he congratulates Coventry on the superb quality of its plating, and—what do you think?—on the ease with which British machines in general can be cleaned! This last bouquet is not one I am in the habit of throwing; but the contrast between our opinions is explained by his past use of American twins.

Instrument Lamps.

SEVERAL suggestions are to hand for illuminating speedometers and oil-drips at night. "H.B." uses two small mirrors to reflect a spot of light from his head lamp. I should say this apparatus must be apt to shake adrift, and would entail a certain amount of dazzle. "C.M." has rigged up a special gadget made of dry battery torch parts; he uses it intermittently with the aid of a switch, and finds it highly satisfactory. "R.B." has been using a Siemens satchel light ever since 1914; the outfit is slung round the rider's neck by a strap, and located in front of his tummy by a belt. It comes in handy for many other purposes, including night repairs and adjustments. I am not sure that it is still marketed, but it certainly looks like the goods for all habitual night riders; a switch is, of course, included. "D.D." uses a pre-war "button-hole lamp" of the dry battery type, designed for the cells to be carried in the pocket, but mounts the juicebox on his machine. "G.J." has converted an ordinary tail lamp into an instrument light, and, after substituting a white glass for the original ruby pane, he gets two beams, one being focussed on the oiler and the other on the speedometer. These devices will give interested readers plenty to think about; I must say that the satchel lamp, insulated and convenient, makes the strongest appeal to me.

SIDECAR COMFORT.

Our passengers can no longer now say that their comfort and convenience receive scant consideration. Could any sidecar passenger, male or female, require greater luxury than a sprung frame machine with a spring wheel sidecar, such as the Matchless here shown, and to which is added one of the latest Easting windscreens? The improved facilities for entering and leaving the vehicle, and the comfort and protection of the screen, are displayed.

A Benzole Tip.

I DARE not dogmatise, for the ways of the fuel magnates are past finding out. But I have a certain amount of justification for stating that in localities where a two-gallon can of benzole is scarcer than pre-war whisky, it may yet be possible to order, and to receive delivery of, a fifty-gallon drum. At any rate I wot of riders who have found this lordly solution practicable. One presumes that the can trouble may occasionally worry the benzole distributers, so that the cynics who hold that the Shell and Pratt shareholders reserve the benzole for their own use may be grossly mistaken. Now fifty gallons is obviously an impossible order for an individual motor cyclist to place. But there are such things as motor cycling clubs. 'Nuf sed.

Secret Switches.

A SAD ignorance of practical riding conditions is evinced by the very obvious patterns of switch now incorporated in most electric lighting sets. The ubiquitous small boy regards a lamp switch as far more attractive than any hooter, and loves to turn on the head lamp when a machine is left in the open. It is by no means a difficult matter to devise a switch which will baffle nine urchins out of ten. The "bezel" type, fitted on Smith car sets, is a good example. Hunt used to market a dry battery tail lamp in which the switch was operated by rotating the bulb-holder, and this was sufficiently unusual to baffle an expert; I know a rider who won many small bets by challenging other motor cyclists to discover his tail lamp switch. There are, of course, two principles on which this very real problem may be solved. One is to camouflage the switch lever, a method which will serve provided the camouflage is varied by different makers. The other is to use a key switch, which can only be operated by the owner.

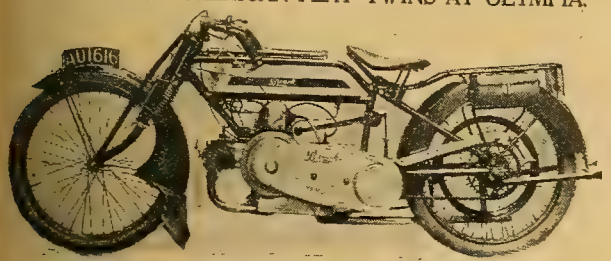
Sixteen Plugs.

I THINK engines on the whole are far less exacting in respect of sparking plugs than they used to be. I have rung the changes this season on four quartettes—sets of Bosch, K.L.G., Heath, and Splitdorf. In 1913-14 I often used to meet engines which always sulked unless a set of genuine Bosch were installed; and when four 1920 Bosch came into my hands, I regarded them as the standard up to which British plugs must come. This year they do not seem to have anything in hand of the K.L.G. or the Heath. All four sets have been freely loaned to people in trouble, and have figured on every conceivable type of engine from racing cars down to baby two-strokes. The Splitdorf is very dear owing to the American exchange, and came into my possession as the official plug for Scotts; once Scott lubrication is mastered, I find that the Heath and the K.L.G. do well in these engines, and the Heath in particular is a fine plug for oily engines generally. During 1920 I have not struck any four-stroke engine which can "incandesce" a Bosch or a Heath or a K.L.G. On the other hand, I fear it is still true that a baby two-stroke which is new and tight can "incandesce" any plug which is made; of course, the phenomenon will only occur if one over-drives a baby on the level, or is forced to put its infant tightness at a hill like Kirkstone or Gunnislake. As soon as the baby has sweetened itself down, it will behave nicely on any good plug, preference being given to an anti-oiler like the Heath. It is gratifying to find that two British plugs, selected almost at random, are at last apparently as good as the Bosch; for I can recall that in 1914 I tested some score of plugs at the request of the trade, and found that one of my engines simply would not run on anything but a genuine Bosch. Further, I notice that few of my neighbours are riding on either Heath or K.L.G., and yet they are experiencing perfect plug joy on other British makes. Hats off to our sparking plug industry, which has certainly made good this year.

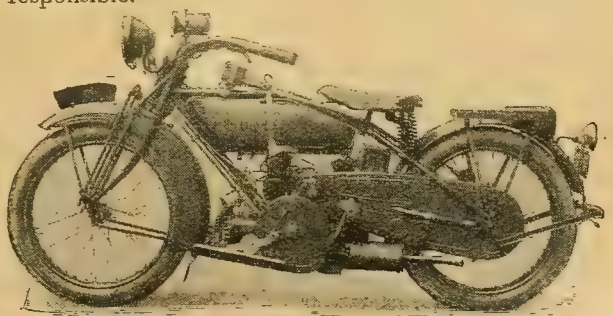
Mr. Brace and Output.

I AM no politician, but I should like to assure Mr. Brace that we could probably sell twenty motor cycles abroad for one which we now sell in England if only we could market them Overseas at a competitive price, and that if we could annex this potential Overseas market, it would keep Coventry, Birmingham, and Wolverhampton busy during those winter months when our home demand usually falls off and leads to short time in the factories. Mr. Brace may possibly be able to prove that certain concessions on the part of capital would assist in securing these markets, which at present are almost wholly lost to us. On the other hand, a great many hold that a larger output per man per hour on the part of labour is an essential factor in the requisite lowering of our export prices. To quote but one example, I have had innumerable letters from Overseas riders since the A.B.C. was first announced at £85; as its price gradually soared to £170 odd, most of these enthusiasts bought American machines instead. In this instance, at least, since the firm went into what is humorously known at law as "voluntary" liquidation, excessive profiteering by the employer cannot be responsible.

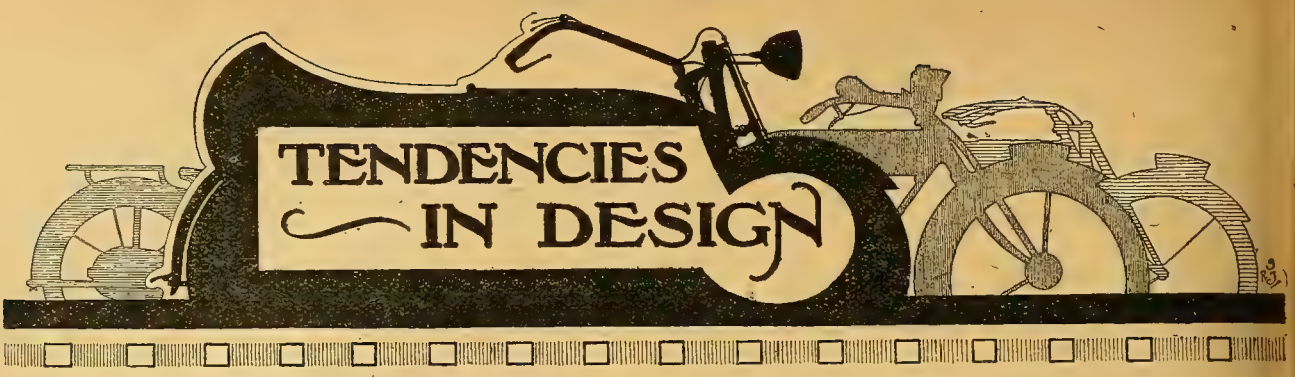
BRITISH AND AMERICAN FLAT TWINS AT OLYMPIA.



Comfort and speed are both provided by this new 3½ h.p. overhead-valved Brough.



Now electrically equipped, the 4 h.p. Harley-Davidson flat twin is a leading example of American solo machine.



A Review of the Most Important Developments in 1921 Models.

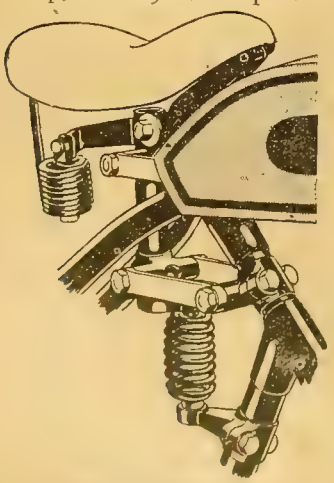
AT the great motor cycle exhibition at Olympia, we have gathered together the world's finest productions in the motor cycle line. A convenient opportunity is thus provided for analysing the progress made during the past year, and a study of the various exhibits provides a vast amount of interest to such as are technically minded.

The earlier months of 1920 were characterised by such a demand for motor cycles, that manufacturers found it difficult to supply the requirements of their customers with standard machines, and few of them found time to experiment with future models. Although the rush fell away considerably at the close of summer, this slackening, which provided more time for investigation and experiment, came too late to permit the results to bear fruit at the present exhibition. As a direct consequence, many of the machines staged on various stands differ little from their forerunners of 1919.

Such differences as exist mostly take the form of improvements from the manufacturing point of view, though not a few will add considerably to the comfort of the rider.

Improvements in Suspension.

It is noticeable, for instance, that larger tyres are fitted, 26in. × 3in. and 28in. × 3in., being not uncommon on machines of 500 c.c. and over. In addition, saddle suspension has received a considerable fillip, and 1920 has produced in a commercial form several devices which are either entirely new or were in experimental forms only during the past year. For example, there is the new Brooks saddle suspension, in which the seat is attached to the carrier by a pair of full cantilever springs on either side, in such a manner as to provide a parallel motion of considerable magnitude, and thus ensure a great increase in comfort. Some months ago there was described in *The Motor Cycle* a seat manufactured by the producers of the popular Tan-Sad pillion attachment, in which the principle of suspension from the carrier was embodied, and this also has borne fruit in the form of a parallel action saddle in which the lower leaf spring on each side is replaced by a link.



One of the several auxiliary systems of saddle suspension,—the Hazlewood.

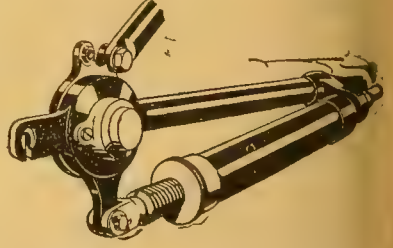
The makers of the Armis are among those who are fitting the Flexa leaf-spring saddle-pillar, while among the machines to which auxiliary saddle suspension now is fitted as standard are the Ariel, B.S.A., Acme, Hazlewood, Rex, and Zenith.

Indeed, this form of suspension appears to be making headway at the expense of the heavier, if more complete, system of rear springing. An intermediate form, in which the footboards are connected to the saddle suspension, is well represented by the Bat, Edmund, and L.M.C., but newcomers to full suspension are conspicuous by their absence, with the exception of the proprietary spring frame introduced by Messrs. Brampton Bros.

Spring Frames.

There are, however, several makers who are not exhibiting at Olympia, and among these are a few who are offering spring frames next year. The Coventry Eagle is one example. Again, there are several spring frame machines only waiting for production facilities to permit their introduction to the public. Such machines as the Indian, Clyno, Royal Ruby, Hobart, Raleigh, Matchless, Coulson, Paragon, and Wooler, of course, retain their well-tried systems, though Messrs. Douglas Motors, Ltd., are no longer showing their rear-sprung "3½."

Many new spring forks have come into existence, which, although not differing largely from accepted practice, are interesting as showing that front suspension is receiving the consideration due to it. Several motor cycle manufacturers have introduced spring forks of their own design, such as the Ariel, and others, including the B.S.A. and A.J.S., have improved or increased the movement of these components.

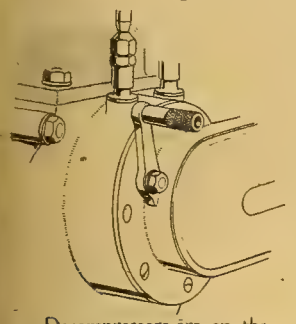


Latest spring frame designs tend to be neater than hitherto. The Coventry Eagle system is extremely inconspicuous.

ENGINES.

While the Show does not include every type of engine in use on motor cycles, the absentees are not important, excepting in two

Tendencies in Design.—



Decompressors are on the increase, and one more make—the Ariel—dispenses with the exhaust valve lifter. Above is shown the decompressor lever of the new B.S.A. single.

cases—the A.B.C. and the Redrup radial. The former, last year, was an excellent example of a carefully thought out design embodying the gear box and placed across the frame. The three-cylinder Redrup would no doubt have created a great deal of attention, and, since it is on the market as a proprietary engine, its absence will be regretted by most who are interested in novel engines of practicable design. At the last Show there were a few examples of freak engines, which have not survived the year.

This year's Show reveals many new engines of almost every type, notably several "big singles," which either take the place of similar machines shown last year or are introduced as additional models.

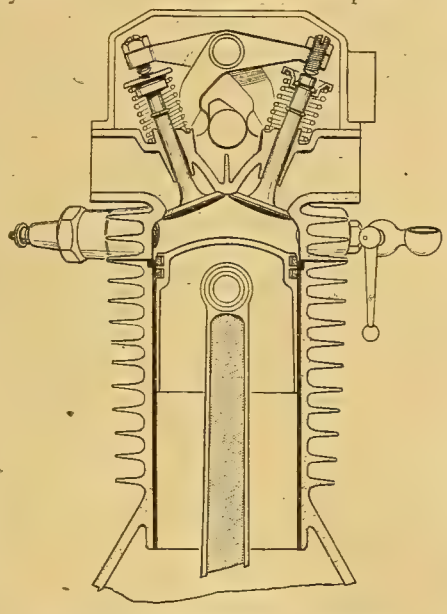
In addition there are at least five new V twins, three opposed twins, and one four-cylinder. In the two-stroke field, the engine of the Scott Sociable and the Villiers with flywheel magneto are the most interesting new propositions.

One feature of the Exhibition is the number of machines embodying the now well-known 500 c.c. Blackburne engine. At the last Show there were only two makes of machines exhibited with this engine; this year there are at least ten. The large number of makers now fitting the 350 c.c. model of the Blackburne swells the lists of outside flywheel machines.

The number of machines fitted with the 5-6 h.p. twin J.A.P. engine, now of slightly larger capacity, is increased by the introduction of such machines as the new Massey Arran, the Armis, and the Omega.

Overhead Valves.

Not everyone will agree that an increase in the number of overhead valve engines constitutes an improvement, but the advanced school who sigh for increased engine efficiency will welcome the advent of the six-valve twin N.U.T., the 500 c.c. sporting model Douglas, the 3½ h.p. Brough, the little Dot-Jap twin, the New Bradshaw engine embodied in a Zenith model, and the Superb four-cylinder engine, with its overhead camshaft. Confirmed believers in overhead valve gear are frankly delighted at this important increase in numbers, which undoubtedly signifies a step in the right direction, and one which will shortly be followed by other well-known firms, some of which have machines of this type on the road even now.



Showing the construction of the Superb four-cylinder engine, which has aluminium cylinders, steel levers, and an overhead camshaft.

Cooling.

The important question of cooling is coming in for a lot of attention. J.A.P., M.A.G., and A.J.S. are amongst the several engines having increased cooling surfaces, and several two-stroke manufacturers have obviously been getting to work on the same subject. Undoubtedly the most interesting developments in this direction are to be found in the Bradshaw and Superb Four engines. The former is based on a principle of heat dissipation from the crank case which was brought into prominence by a series of scientific experiments on air-cooled aero engines during the war. This principle has been inadvertently, unscientifically, and sometimes unwillingly applied in most engines, and now for the first time is to be intentionally carried out on carefully thought out lines.

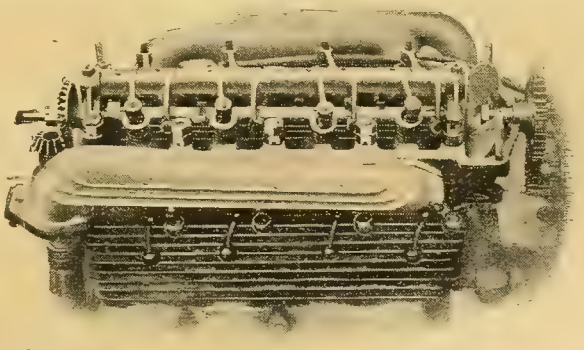
Cooling by Oil.

It is Mr. Bradshaw's idea to cool his engine internally as well as externally, and to dissipate as much heat as possible through the crank case. For this reason he employs forced lubrication and special means of distributing the oil over the whole of the interior of the engine, after which the oil is withdrawn by a second pump and, after being cooled on its passage, is returned to be used again. It is stated that after twenty-two laps of Brooklands "all out," with a new and unused engine, the oil remains green and clear, showing no signs of deterioration.

Metallic contact between the invisible cylinders and the crank case is ensured by the former being slightly "pinched" between the two halves of the latter, and aluminium pistons are used to ensure adequate cooling. This most interesting engine will be watched with the greatest attention by all who have the welfare of the motor cycle at heart, since it involves a method of cooling which is almost revolutionary.

Aluminium Cylinders.

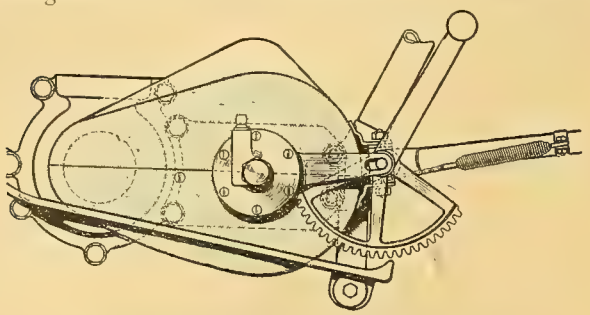
Of almost equal interest is the Superb four-cylinder, not only because it is the only British four-cylinder engine to be staged, but because



Overhead camshaft and valve gear of the British four-cylinder motor cycle at Olympia.

Tendencies in Design.—

of the intrinsic merits of the design. Here we have a four-cylinder-in-line engine, with aluminium cylinders and top half crank case cast in one piece. The cylinder liners are held down by the heads. Inclined overhead valves are operated by a bevel-driven overhead camshaft, and forced lubrication is employed throughout.

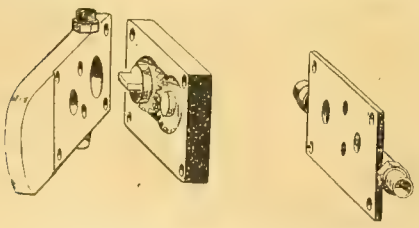


The Enfield kick-starter on the lightweight model.

A three-speed gear box is incorporated with the engine, which is beautifully carried out, and naturally the exhibit attracts an enormous amount of interest. Here, then, we have examples of three different methods of improving heat dissipation, an enlargement and redistribution of cooling surfaces, a new method of heat dissipation *via* a specially designed crank case, and an aluminium cylinder block with forced lubrication.

TWO-STROKES.

The number of small two-strokes does not diminish, and, except for the flywheel magneto Villiers with its unconventional induction system, little radical change has been made in design. There is, however, a tendency to increase engine capacity, and to fit light sidecars to specially strengthened frames. The Ivy, Connaught, Cedos, Armis, Allon, Alecto, Ixion, and Calthorpe may be quoted as good examples of this type of machine, while the 500 c.c. Dunelt, now a commercial proposition, remains the sole example of a single-cylinder air-cooled two-stroke of this capacity. It has, however, proved its capabilities, and has two gold medals in the A.C.U. Six Days Trials to its credit, incidentally the only trial in which it has competed.



Lubricating pump of the Bradshaw engine dissected. A similar pump is fitted to the opposite side to return the oil to the tank.

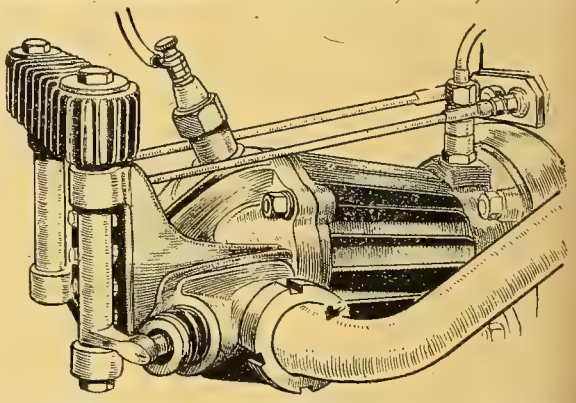
The Scott motor cycle engine remains almost unchanged, and its many successes during the past year lead to little expectation in this direction. The engine of the Scott Sociable is another matter, but this is more properly dealt with under the heading of "Runabouts."

GEARS AND TRANSMISSION.

A new proprietary three-speed gear box is quite an event in these days, and no article dealing with progress can afford to miss the Comery gear exhibited on the Brough stand. It is a notable example of clever but commonsense design, and the workmanship is on a par with its ingenuity. Messrs. Lea and Francis and Rudge-Whitworth have introduced new three-speed gears of their own. The Moss Gear Co. has a new two-speed countershaft box, and the Kingsbury is a fresh example of a two-speed selective clutch mechanism. Further, the Levis firm have a three-speed box of their own design in an experimental stage.

Despite the claims made in favour of unit construction of engine and gear box, there is no decided tendency in this direction. Except for the Superb Four, new designs embodying this feature are conspicuous by their absence.

The demand for clutches and kick-starters on lightweights is apparent by the number of makers who now offer models embodying them, while it is noteworthy that the Enfield lightweight, which has a two-speed selective clutch unit, may now be obtained with a kick-starter. Not a few makers have at long last decided to provide mechanical means for adjusting primary drive chain centres. Chain drive is steadily gaining ground, but there are many who provide an alternative of chain-cum-belt for those who favour this form of transmission. The Wilkin, Ariel, L.M.C., Rudge, Superb Four, Rex, Acme, are newcomers to all chain transmission, but a few remain faithful to plain belt drive for their sporting models.



On the new Douglas, radiating fins are cast on the small aluminium oil reservoirs, from which the overhead valve rocker shafts are lubricated by a wick system.

As regards shaft drive, enthusiasts must still await its coming, for, in respect of motor cycles proper, the F.N. remains the solitary example, though the Unibus is an addition which includes many other advanced features.

LUBRICATION.

For years past *The Motor Cycle* has advocated the use of mechanical lubrication with a view to relieving the rider of trouble in this respect, and of ensuring a regular and adequate supply of oil to every part of the engine. It is satisfactory, therefore, to note that almost every engine of recent design incorporates this very desirable feature. Last year's Show introduced to the public the P. and M., B.S.A., Velocette, Clyno, Corona, and Humber systems, all of which remain; and the number of machines thus equipped has now been swelled by such engines as the Bradshaw, Superb Four, Vickers-engined Enfield, 4½ h.p. Ariel, and Cykelaid.

It was not to be expected that manufacturers whose products remain unchanged in other respects would

Tendencies in Design.—

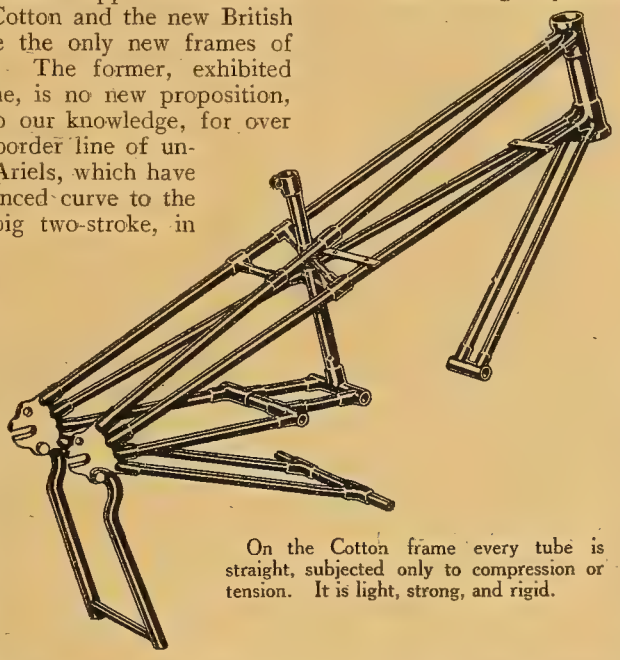
have added mechanical lubrication to their specification, but the demand for conversion sets is amply demonstrated by the number of these which are obtainable. Messrs. Best and Lloyd, Lamplugh, and Showell and Sons, all market such devices, which are likely to become increasingly popular as their merits become more generally known.

Lubrication of machine parts is receiving greater attention, and quite a number of designers have embodied convenient lubricators on the steering heads. An interesting innovation is the hub and fork bearing lubrication of the new Ariels, in which the spindles are drilled so that the bearings may be charged with lubricant by means of an oil gun.

FRAME DESIGN.

There is a steady improvement apparent in frame construction, although the Cotton and the new British Excelsior duplex frames are the only new frames of unconventional appearance. The former, exhibited at Olympia for the first time, is no new proposition, having been on the road, to our knowledge, for over six years. Perhaps on the border line of unconventionality are the new Ariels, which have a high frame with a pronounced curve to the top tube, and the Dunelt big two-stroke, in which both tank rails slope downwards to the rear.

A decided tendency is apparent among frame designers to favour straight top tubes, which, in an increasing number of cases, are covered by saddle tanks. The new Hobart, 8 h.p. Hazlewood, Verus sidecar machine, 5-6 h.p. Omega, Francis-Barnett, and 6 h.p. Quadrant are striking examples. The curved top tube, at one time almost universally adopted, is slowly disappearing, though a few new machines still embody this characteristic.



On the Cotton frame every tube is straight, subjected only to compression or tension. It is light, strong, and rigid.

In some cases lugs are considerably strengthened, and sidecar lugs integral with the frame are general practice on all machines intended for sidecar or dual service; the Hazlewood even goes to the length of fitting an auxiliary stay between the two front attachments.

Another very noticeable feature to those who take the trouble to enquire is the increase in the employment of steel lugs in the more vital parts of the frame. These steel lugs in some instances are castings, in others forgings, and in a few, notably the Rudge, pressings.

The large number of ladies' models now offered with semi-open frames is evidence that makers are contemplating extending their markets. Last year there were but few machines of this type at Olympia.

MUDGUARDING.

Each year has seen some improvement in mudguarding, but until this year the problem has not received the attention due to it. There is scarcely a 1921 model, however, which does not embody mudguards which are a distinct improvement over the types used by their makers last year. Undoubtedly there is strong evidence that every maker has endeavoured to improve his production in this respect. Even machines admitted to be better guarded than the majority of 1920 models have gone a step further by the introduction of wider and better designed guards, some embodying gutters on the inside edges to guide water and liquid mud to a part of the guard where it may drop off without bespattering the machine or its rider. An increase in the fitting of leg guards as standard fitments is another commendable feature, while footboards are improved in design, and are larger and better fitted.

CHAIN CASES.

The growing popularity of chain transmission has brought along improved chain cases which are more accessible, better made, and easier to detach and replace. Flywheel guards, too, are becoming general on engines fitted with outside flywheels, and the dressguards on the ladies' models are better carried out.

CARBURETTERS.

Speaking generally, two-lever carburetters have changed but little during the past twelve months, but there appears to be a tendency on the part of manufacturers of well-tried car carburetters to enter the motor cycle market. The Claudel Hobson, as fitted to the A.B.C., has already made many converts to the single lever type, and a new model made specially for motor cycles is now ready for the market. A motor cycle type Zenith, which has been in use in France for some time, has found its way on to the Bradshaw engine, an event which would not have occurred without good reason. The Capac has already many admirers, and we are likely to hear more of the Degory "no jet" carburetter and the Cox Atmos.

Of the single-lever carburetter generally, it may be said that progress is somewhat slow, probably due to the fact that some makers appear to find it difficult to produce a carburetter which will give equally good results on different makes of engine. Thus we hear both eulogy and condemnation from designers of different engines concerning one or another carburetter, and for the time being several motor cycle manufacturers are reverting to the two-lever type on this account. There seems to be little doubt, however, that the single lever instrument will in time become a standard fitting, though many keen riders prefer to retain a second lever as a means of instant adjustment.

There is still much to be learned about carburation, especially as regards two-strokes, but there is every reason to expect an early development in this direction.

Tendencies in Design.—

Some very remarkable results have been obtained recently on officially observed consumption tests, figures of 320 m.p.g. being recorded with a standard 211 c.c. two-stroke over a distance of fifty-four miles at average touring speed. Such tests at least serve to show that the vital question of economy is exercising the minds of British carburetter experts, and we think that developments are pending which will greatly reduce the fuel consumption of motor cycles in the hands of the public.

WEIGHT.

So far there are few signs of a serious effort at weight reduction, but, perhaps, the new taxation scheme will bear fruit by Show time next year. It is true that heavy machines will not be affected by the taxation, and only those that weigh between 200 and 250 lb. can hope to save their customers 30s. per year. Once improvements are made in this direction they will be welcomed by all.

In larger classes of machines, the new sporting Sunbeam, introduced in the summer, seems to have set a fashion in lighter solo mounts of 500 c.c. In addition to the Wolverhampton production, solo "light fours," as they are termed, are included in the Rex and Verus programmes, and certain other well-known firms are likely to follow suit in the near future.

Last year there were no solo V twins smaller than the 500 c.c. class, but at the present Show at least one sporting lightweight has an overhead valve V twin of 350 c.c. This is the little Dot-Jap, a development of the machine which competed in this year's Junior T.T.

LIGHTING.

The success of the Lucas Magdyno on luxurious outfits has emphasised the need for electric lighting all round, and as is usually the case, demand has produced the necessary genius. The M-L Maglita has materialised, after long and thorough tests, into an exceedingly practical combined ignition and lighting set for use on all sizes of machines, while just before the Show the B.T.H. Co. introduced to the public details of their new and ingenious system of utilising the idle "maximum point" in engine speed magnetos. This brings the two-stroke a lighting set of its own, which will sell at a price proportionate to the class of machine to which it is suited.

Generally, lighting equipment has made big strides, exemplified by the Hawley Morgan generator, and the re-introduction for lighting purposes of dissolved acetylene by Allen-Liversidge, Ltd. Improvements in gas lamps are not strikingly noticeable, although detail alterations, as the outcome of experience, may be observed in some instances.

MINIATURES.

As foreshadowed by *The Motor Cycle*, the scooter is developing into a miniature motor cycle, and at least two manufacturers will, in future, assiduously avoid the use of the term in connection with their products. This development is as it should be, and the genuine open frame seat type miniature will, in due course, come fully into its own. The Whippet retains most of its attractive features, changing only as regards piston material, carburetter, and cam details. The Unibus is a most striking innovation with its spring frame, two-speed gear, worm drive, and complete enclosure. It is designed on ideal lines, but it remains to be seen whether the public will prefer such an "ideal" miniature or a larger motor cycle at the price. The Kenilworth in its latest form is a fascinating little mount, weighing only 70 lb., and has earned a most enviable reputation in the Midlands for its comfort and reliability. Triangulated tubular construction now takes the place of steel side plates for the frame, and an overhead valve engine is retained. Detail improvements only have been found necessary on the Skootamota.

Taken on the whole, it may be said that the scooter is dead, and that from its ashes has arisen a miniature motor cycle of practical value. The number of exhibits of this small type of machine are less this year, and it has been a survival of the fittest. Spring frames appear to be "catching on" with designers of miniatures, which is perhaps hardly surprising in view of the state of the roads. A tandem-seated miniature and a small motor tricycle, too, are new introductions at Olympia this year.

RUNABOUTS.

In number of exhibits, three-wheeled runabouts are comparatively few, but in interest they are prolific. Here, shaft drive appears to have got a firm hold for the T.B., Castle-Three, and Scott Sociable are all three fitted with this form of transmission.

The Scott Sociable, already thoroughly described in these pages, is naturally a centre of attention. Unorthodox in every detail, it is, nevertheless, an engineering proposition from start to finish. Its triangulated frame is perhaps a little astonishing until the underlying principle is mastered, and the twin two-stroke engine, with its rotary inlet valves and double-pole ignition system, is, to say the least of it, unusual.

The "sidecar" layout of the wheels, although necessitating an unusual appearance, has certain advantages in regard to the rider's comfort and the stresses imposed upon the frame. For this reason, it may be considered as a distinct advance. At first sight it may, by many, be classed as a freak, but it is the outcome of more than five years of experiment on the part of one of the cleverest brains in the trade, and road experience will be sufficient to convince most people of the value of its distinctive design.

A newcomer in this class of vehicle is the New Hudson, a name, like the Premier, associated before the war with sidecar outfits.

In so far as genuine progress is concerned, it is a moot point whether any very considerable elaboration has proportionate advantages over the simpler and lighter types of three-wheelers. Excepting for the Scott Sociable, there is little in the three-wheelers at Olympia which is radically new, although the front wheel-driven Stanhope is not of a well-known type.

On the popular Morgan, which is all that is simple and straightforward, detail improvements of some importance have been made, notably a detachable rear wheel and interchangeable chains, but the vital features remain as before.

Perhaps one of the most striking improvements is the fact that the accessibility of rear wheels has, at last, received the attention it merits, and in at least three cases all wheels are interchangeable.

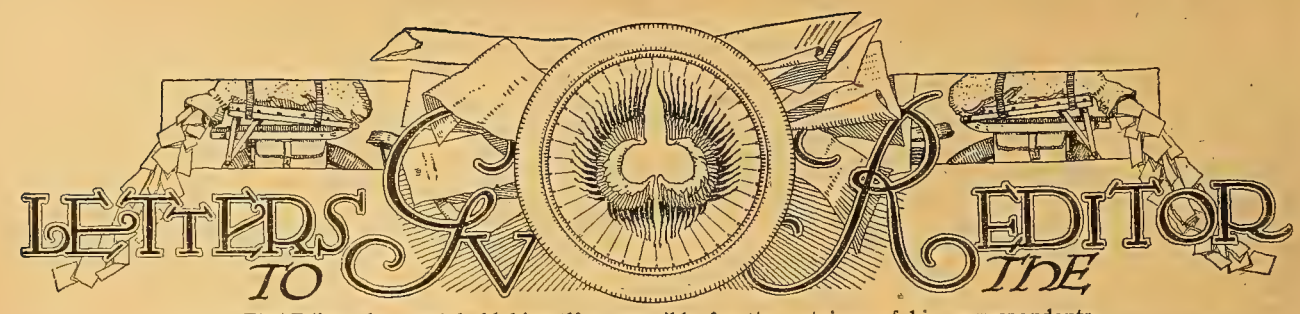
Cunningham 1920.

DII



The Editor does not hold himself responsible for the opinions of his correspondents.

All letters must be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

THOSE INCREASED SUBSCRIPTIONS.

Sir,—*The Motor Cycle* of November 18th tells me that the A.C.U. and the A.A. have increased their subscriptions by 100%.

May one be permitted to ask these august bodies how they justify this increase; and what they (especially the atter) do for the average motor cyclist in return?

Barnstaple. BLED DRY.

SKIDS.

Sir,—I also was very interested in "Ixion's" remarks in his "Occasional Comments" with regard to traffic signals whilst on greasy roads. I am a weekly rider from Chichester to Ealing, and, like "Duggie," your correspondent, pass through Isleworth, Hounslow, and Brentford, and many of the skids I have had in the latter place. Indeed, at the end of last winter, I came to the conclusion that it was impossible to ride through Brentford on a wet day without skidding, owing to the appalling surface of the road, composed of large uneven stone setts with rounded tops. J. A. PRISMALL.

PILLION RIDING.

Sir,—In many of the modern machines turned out to-day it is the practice to support the carrier with two strong tubes each side, forming a triangle, and no longer carrying stays, or tubes, to the frame under the saddle.

This method is, no doubt, neat and strong; but, as one of thousands of motor cyclists who are very fond of carrying passengers on the carrier, I should like to point out that I find the modern method much more dangerous.

Passengers, for safety, must sit as far forward, towards the driver, as possible, and, with many carriers to-day, this is not possible, because the carriers end a considerable distance away from the saddle. PILLION.

Chester.

CYCLE BEARINGS.

Sir,—I have just read the article in *The Motor Cycle* on the adjustment of cycle bearings which appears in your issue for November 4th. Without the least desire to be critical, I beg to attach a few remarks thereon, which I trust you will find suitable for publication.

The cup and cone type of bearing, as the writer admits, requires adjustment frequently, and this is one of the features which makes a bearing of this type so unsatisfactory for use on machines which are being handled by many who are not skilled mechanics.

The modern bearing for use in the wheel hubs, and also in the crank spindle, is the annular type of ball bearing, which is preferably of double row construction.

With regard to the steering head bearings, we certainly cannot agree that the standard ball thrust bearing is not suitable, since this is one of the most efficient anti-friction bearings possible for dealing with the loads encountered here. Possibly, however, the use of additional radial bearings might be an advantage.

With regard to his remarks on the replacing of balls in a bearing, there is no doubt that the expedient of introducing one or two small balls to replace broken ones might be satisfactory as a temporary arrangement, but in such a case the complete set of balls should be removed and an entirely new set inserted. If such balls have been obtained from reliable manufacturers, then there will be no doubt whatever as to their equality in size, and consequently the best results will be obtained. C. THOMPSON WALKER.

THE SKEFKO BALL BEARING CO., LTD.

PETROL CONSUMPTION.

Sir,—It would interest riders of the 1920 model to know fuller particulars of how this record was established, condition of roads, contour, carburetters, and setting.

I have one of these models fitted with the top feed A.M.A.C. standard as purchased. I have reduced the jet from 32 to 31, and altered the float level as advised by makers, and now cannot average 50 m.p.g. with empty light Millford Olympic sidecar. There is no gear slip on the engine shaft.

Maybe some more intelligent rider of this model, or the makers, will tell us how results even near to 144½ per gallon can be obtained. C. W. BURNS.

OWNER GOING ABROAD.

Sir,—I never miss reading *The Motor Cycle* every week from start to finish, even when abroad.

When reading the advertisements, I notice a large number of advertisers, wishing to dispose of their outfits, offer the excuse "owner going abroad." Having been the possessor of a Triumph outfit in India, and having read the remarks frequently offered in your paper of the pleasures of owners in other Colonies and countries, I fail to see why any owner should dispose of his pet outfit when going abroad, for I am certain in nine out of every ten places abroad motor cycling can be made a pleasure.

I have myself been contemplating taking a Triumph or B.S.A. outfit with we when I return to India in March next, but seeing the excuse "owner going abroad" in so many advertisements has rather damped my spirits. Personally, I should think such was rather hard for British machines, as it first tends to make one think such are useless abroad, when actually, in my opinion, they are the *best* and cannot be compared with foreign makes.

On the other hand, perhaps there are some real and insurmountable difficulties in an owner taking a machine abroad, for I know of one case, when I was in India, where I sent to an English firm to purchase an outfit to be sent to me in India, and the firm, with regret, said it could not comply owing to makers' restrictions.

Sidmouth. OWNER GOING ABROAD.

AN AIRMAN'S PREVENTIVE FOR COLD FINGERS.

Sir,—Now that the cold weather is beginning to force itself upon us, several motor cyclists will be thinking of the best means of keeping their fingers warm, so perhaps a tip which was used largely in the Flying Corps may be useful.

A pair of plain leather *unlined* fingered gauntlets should be procured, about six to eight sizes too large for the wearer. (In my case they were so large that I wore a pair of fur-lined kid, a pair of washleather, a pair of woollen, and a pair of silk gloves underneath.)

Now, if a pair of good quality loose fitting silk gloves are worn inside the gauntlets they will be warm enough for all ordinary winter touring.

In extra cold weather, and when high speed work is necessary, a pair of good camel-hair gloves, worn in conjunction with the above silk and leather ones, will be found to keep the hands exceedingly warm for hours on end. I found that when thus attired my hands never suffered with the cold, even when flying 12,000 to 15,000 feet in the worst weather.

I have discovered that fingered gloves worn in this manner are quite as warm as the fingerless variety, and are much more handy. V. R. BLOW.

FOR ONE PERFORMANCE ONLY.

Sir,—The other day a solo motorist rode up to a shop, jumped off his machine, and walked straight into the shop. The machine, an Indian, remained upright for quite an appreciable time, at least five seconds, and then fell over on its side with a crash, fetching the rider hurriedly back to his mount. The episode, viewed by onlookers, appeared to savour of extreme absentmindedness, or maybe he was used to a sidecar, but I wonder if it could be beaten as a case of what not to do. H. T. ROBERTS.

SIDECAR TROUBLES.

Sir,—As a novice in the motor cycling world, I have had great difficulty in getting a suitable sidecar body with a child's seat at the back.

The cycle and chassis were bought together, and an order given to a firm of sidecar specialists for one of their bodies to suit the chassis, but on taking delivery it could not be fixed to the chassis, and I had eventually to forfeit my deposit.

I then gave an order, accompanied with a full set of measurements, to another firm.

While the body they supplied fitted the chassis, and was very nice, the child's seat was not less than seven inches too small! They are doing the right thing, and making me a new body while I make shift with the other, but I am debarred from any but short runs meanwhile.

Let those who want special bodies built have a clear undertaking in writing from the makers before finally ordering. LABOR.

Kew Gardens.

HAND SIGNALS.

Sir,—With reference to "Garfield's" letter in your issue for November 18th, although there is perhaps a similarity in the signals "Come on" and "I am about to turn right," only a very careless (and callous) driver would give these two signals in such manner as to confuse the one with the other, or to leave any doubt as to which signal is intended. When overtaking traffic at cross-roads or side-turnings, it is surely policy to keep behind until "safe at last, the danger past," one can overtake without fear of accident.

I note "Garfield" asks for suggestions for "more distinct road signals." May I append the following: For "am turning left (or right)" motorist stops machine twenty yards away, runs to corner, and points long and earnestly down the side road, then goes back to the machine, starts up, and turns in the opposite direction at the corner!

Seriously though, I do not think the existing signals can be improved upon if properly given, although a handle-bar worked automatic device would no doubt save us from bruises, or worse, through skids when going, say, from Staines to Kew Bridge, eh, "Duggie"? IMPERATOR.

Grimsby.

BEHAVIOUR OF LIGHT SIDECAR MACHINES.

Sir,—With reference to "July's" remarks on misfiring on two-strokes, may I be allowed to supplement his hints by my own experience?

I have had a 2¾ h.p. T.D.C. two-stroke engine under close observation since last Easter, this little engine pulling a machine with sidecar attached. From experience, I find that two-strokes only four-stroke when the human element (the driver) is at fault—that is, of course, if the engine is timed and lubricated with ordinary care. In starting from cold, even in winter, I can start in four paces (counted), and the engine will fire and two-stroke beautifully. I never flood the carburetter. I advance the air lever gradually, listening to the beat of the engine for signs which tell me in an unmistakable manner the correct position for the best mixture.

This engine *never* four-strokes at high speeds, although it may pop back through the carburetter due to a weak mixture. Two-strokes must be carefully timed, especially where the magneto is coupled direct to the engine-shaft. Time with the piston dead on top, but the connecting rod on the rising side of the crank pin just before passing over the dead point, which can always be seen through the inlet. The points should be just on broken, and the magneto fully retarded. The carburetter *must* be in good tune.

I have found from practice the correct setting of the variable jet, and rarely have to alter it. I have no extra air inlet, and do not require it, having altered the cap of the inlet to suit the needs of the carburetter.

I could say lots more about this particular make of two-stroke engine, and the reason why two-strokes four-stroke when they are being driven by a driver who will not trouble even to listen to his engine, let alone try and correct its inherent weaknesses.

GEO. HAZEL, Lt.; R.N. (retired).

ACCUMULATOR LIGHTING FOR SIDECARS.

Sir,—The wiring diagram in your contributor's article entitled "Accumulator Lighting for Sidecars," which appeared in the issue of *The Motor Cycle* dated November 11th, is incorrect. On the linked switch being operated, one of the four-volt cells will be short-circuited, but no light of any kind obtained.

A correspondent in the same issue states that by using a half-watt lamp he obtains double the candle-power of a one watt lamp. This may be so, but half-watt lamps are not yet on the market, the nearest approach being the gas-filled variety. It may interest him to know that for small lamps the candle-power per watt of vacuum and gas-filled lamps is approximately the same. A comparison of a 200-volt 60 watt vacuum and gas-filled lamps shows that the vacuum lamp gives 8.6 lumens per watt, and the gas-filled one 10.26 lumens per watt. Assuming one watt per candle-power for the former, then the latter gives $\frac{10.26}{8.6}$ c.p. = 1.19 c.p. per watt.

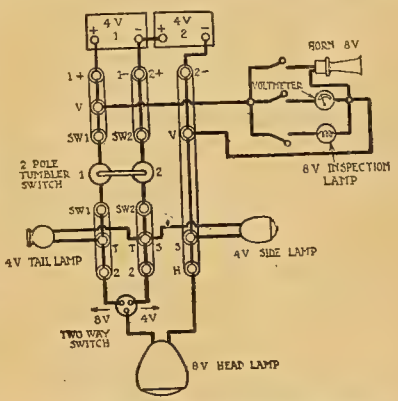
In the small size mentioned by your correspondent, the gain will be even less, and not worth the greater cost and shorter average life. A 1,100 watt 100 volt lamp has a maximum efficiency of .59 watt per c.p. The apparent extra brilliancy of gas-filled lamps is due to the shorter wave length, and in reality does not exist. PIP EMMA.

Sir,—In a recent issue of *The Motor Cycle* you publish an article, "Accumulator Lighting for Sidecars." This will, no doubt, be of great use to motor cyclists who desire to equip their combinations with electric light, but I should like to point out for their benefit one or two errors in the diagram on page 546.

(1.) The double pole switch is wrongly wired, one accumulator being shorted in the on position and the other permanently off.

(2.) Even with this switch correctly wired, the 4 volt sidecar lamp is in an 8 volt circuit.

(3.) The position of the voltmeter switch renders the horn and inspection lamp inoperative unless the voltmeter switch is used at the same time.



A modified lighting diagram on the lines of Mr. Woodfield's, which was incorrectly reproduced by our artist in a recent issue. (See letter from "Amateur.")

Much as I admire the compact neatness of Mr. Woodfield's diagram, I think that the average motor cyclist, or novice, would more readily understand one on the lines of the enclosed, which is a modified layout of the diagram in your paper, and is quite correct as regards the connection.

Personally, I do not like the system, as, if for any reason the head lamp was much used on 4 volts, one accumulator would be used more than the other, and, *ipso facto*, the voltmeter being connected across both accumulators, might show the 7.2 volts, specified by Mr. Woodfield, with one accumulator at 3.2 volts and the other at 4 volts.

Wishing your paper was a daily instead of a weekly,

Cheshire. AMATEUR.

[We have received several letters pointing out an artist's error in the wiring diagram accompanying Mr. Woodfield's description of his lighting set. The above was selected as being on the same lines as the original article, but there are obviously many variations possible, especially if different voltage bulbs be used.—ED.]

Olympia.

The greatest show of motor cycles ever organised.

The London-Exeter Run.

Chatting with Alan Hill, the organising secretary of this year's M.C.C. London-Exeter run, we learned the other day that an unexpectedly large number of entries is being received for this strenuous Christmas trial. Upwards of two hundred competitors are anticipated.

The Research Association.

The secretary of the Department of Scientific and Industrial Research announces that a licence has been issued by the Board of Trade to the British Motor Cycle and Cycle Research Association, which may be approached through Major H. R. Watling, The Towers, Warwick Road, Coventry.

The M.C.C. Annual Dinner.

No speeches but a good musical programme is to be the chief feature of the fourteenth annual dinner of the Motor Cycling Club. This event is to take place on Friday, December 10th, at 6.30 p.m., at the Wharncliffe Rooms, Hotel Great Central. Numerous applications for tickets have already been received. Tickets can be obtained from Mr. Southcomb May, 34, Gower Place, London, W.C.

Over 95 m.p.h. at Brooklands.

The Indian still continues to distinguish itself on the track. One day last week, in bright, cold weather, Le Vack covered the mile flying start in 37⅘s., at a speed of 95.24 m.p.h., beating the previous record by C. R. Collier on a Matchless of 39.40s. = 91.37 m.p.h.

Riding against the wind and in bitter cold he then captured the flying kilometre record, time 23⅗s., speed 94.79 m.p.h., beating the previous record, by S. George on an Indian, of 23.93s. = 93.48 m.p.h.

Following upon these achievements, Le Vack created a mean speed record for the flying mile of 90 m.p.h. Later in the week he attached a sidecar to his record-breaker, and made a clean sweep of the records up to 350 miles and six hours. His speeds and times were as follows :

5 miles, f.s. ..	4m. 14⅘s. ...	70.69 m.p.h.
10 miles, s.s. ..	8m. 50⅘s. ...	67.87 ,,
100 miles	1h. 36m. 48⅘s. ...	61.98 ,,
150 miles	2h. 23m. 48s. ...	62.58 ,,
200 miles	3h. 13m. 3⅘s. ...	62.15 ,,
250 miles	4h. 2m. 15⅘s. ...	61.88 ,,
300 miles	4h. 48m. 13⅘s. ...	62.45 ,,
350 miles	5h. 47m. 56s. ...	60.30 ,,

Industrial Management.

The Institute of Industrial Administration is holding a meeting at the Central Hall, Westminster, on December 7th, when Mr. Richard Twelvetrees, A.M.I.Mech.E., will read a paper on "Road Transport as an Aid to Industrial Management."

The "Six Days" Report at Last.

At long last the A.C.U. has issued the official report on the Six Days Trial, and we are asked to review it in this week's issue. As there are twenty-eight pages (demy quarto), we reserve the task until after the present pressure on our space on account of the Show. We cannot compliment the A.C.U. on the time taken to compile this report of a trial.

A Paris-Nice Trial?

Dr. A. M. Low writes us with regard to the Paris-Nice Trial, pointing out that the fiasco of last year's trial was due to a misunderstanding which is not likely to occur again. He appeals to British manufacturers not to withhold their entries from a trial in which British machines attract a considerable amount of attention. It should be added that Dr. Low has been appointed as one of the judges for the 1921 event, and his experience should be of value to the organisers.

NEXT THURSDAY'S PASSENGER NUMBER.

THE MOTOR CYCLE

Dec. 9.h,

Will be devoted chiefly to PASSENGER MACHINES and their appurtenances. In addition to detail descriptions of the Sidecar Attachments exhibited at Olympia, the issue will contain a review of all Passenger Motor Cycles which will be offered in 1921.

Other special features will include authoritative information regarding new three-wheelers, an article dealing with sidecar comfort from the passenger's point of view, and further particulars of new accessories

THURSDAY.....4½d.

Special Features.

OLYMPIA SHOW REPORT.

TENDENCIES IN DESIGN.

MODERN NOTIONS IN SIDECARS.

Over 100,000 Circulation!

105,523 represents the circulation of *The Motor Cycle* for November 18th. This journal still enjoys the distinction of being the most widely read motoring journal in the world.

If only it were True.

In a small advertisement in a provincial newspaper an Indian motor cycle is offered for 7s. 9d.

Taxi Sidecars at Olympia.

Almost every sidecar manufacturer is exhibiting a taxi sidecar at Olympia, but it would appear that some of them have yet to be passed by the police authorities.

New Douglas Records.

Last week B. Tudor Thompson, on a 2¾ Sports Model Douglas, beat several Class B records, including the hour mileage, which the Douglas increased to 63.39 miles, and the 50, 100, and 150 miles, and one, two, and three hours with sidecar.

An Ingenious Theft.

A reader recently advertised his 1919 3½ h.p. Sunbeam (engine number 37/5874) in *The Motor Cycle*. In his absence a potential buyer approached the agent who had charge of the machine and expressed a desire for a trial run. Naturally the agent agreed, but at the same time stipulated that he should come along on the carrier. Preparatory to the start the crook (as he turned out to be) had placed his overcoat on the kerb, and now asked his watchful passenger to hand it to him. The agent complied; but in a moment the machine and its "purchaser" had vanished. A very meagre description contains one point that may help to trace this uninsured machine—the thief was young and had red hair.

Danish Successes for British Machines.

The new Copenhagen track was recently opened by the King of Denmark. After the ceremony a motor cycle race took place, the results being as follows :

350 c.c. TWO-STROKE CLASS. Four laps.

THE MAGIC GLIDE.

Being an account of a trip to London on the new Brooks Cantilever Spring Saddle.

FOR months past the writer has seen and heard quite a lot about the new Brooks compensating cantilever spring saddle. This is only natural since it is he who has the pleasure of telling you through the press about the various products of the Brooks factory, in other words, the advertising man.

The first sight of the new model immediately made him enthusiastic, and with the approach of the Motor Show it was thought a good opportunity to sample this new saddle by travelling to London by motor cycle.

Not having yet found a machine speedy enough to reach London from Birmingham as quickly as the train, it was necessary to make an early start in order to put in several hours at the Exhibition. The saddle was therefore fitted to the machine the day before, so that the correct adjustment—and it is a feature of this model that it can be adjusted through a wide range of "tilts," and to suit any weight of rider—might be found before the longer run was undertaken.

Six-o'clock on a cold and frosty morning saw the garage doors open and a gummed-up engine being energetically kicked over in an endeavour to awaken it to the importance of its errand. 6-5—no later, it went over with a machine-gun crackle; lamps were lit, the rider sank into his lounge chair- B.600, and needing but the banded cigar to complete the profiteer-in-Rolls-Royce-illusion, glided towards London.

A merry speed was set to start with and kept up despite road surface, which as Birmingham readers know is not ideal on the Castle Bromwich exit from town, and so my arm-chair trip was severely tried in the earliest stages.

The road was our own save for an occasional milk lorry, which clanged by in the dark, so that speed could be kept fairly interesting. Presently things got lighter and "Jimmy" (the bike) and I were given an inkling of the glorious morning we were going to have for the run. The road, the sward, the trees, and fields were whitening fast, though we needed no such visible reminder of the fact that "Jack Frost" was as busy as ourselves. But we welcomed it, for it added one more to the many phases of that memorable magic-carpet-like-glide to London.

Was it possible that we were really making this trip to London on Post-war roads, or was it another of those dream trips which so many of us have experienced, only to find when next we did actually take to the roads, they were still the same pot-holed, rut-ridden, spine-shakers?

No, this was the real thing, because—well, the London side of Coventry has not been exactly a billiard-table for some time past, and I was reminded of it this trip, by the repeated clattering of my back stand, the fastener being none too secure. This pot-hole tell-tale was somewhat too noisy, and had to be secured, but now we were able to "see" there were pot-holes, and stretches of bad surface; but what a joy not to feel them!

Hereabouts, water trying to pass as benzole was rejected by the engine, and for a time progress was slow, and finally non-existent. After dismantling we enjoyed, yes, enjoyed almost full throttle for mile after mile, no "bounce," no "jockeying," no tortuous detours to avoid pot-holes, setting up violent wrist-aches, and yet without anticipating that "over-the-handlebar feeling" experienced with some saddles when hitting any considerable road irregularity.

Tram lines, granite setts, and accompanying evils again—London is in sight—yet never a care, we have the advantages of a spring frame (but without attendant side-sway, or snatchy chains), and to our mind the road might be a skating rink.

Then, hey, for Olympia, and here we smile to ourselves, knowing that the motor cyclist can at last enjoy car comfort on his more exhilarating two-wheeler. We smile, too, at the thought of the crowds that will welcome this new saddle on its first public appearance, at the Motor Cycle Show.

Next morning to the White City for a few hours, then, anxious to rest a while we put on our Brooks "Spring-ons," for "it was murky overhead," and got into the saddle, and away again.

The threatened rain held off, and the sun came out, adding a glow to the Autumn panorama, so that one could scarcely realise the lateness of the season. Despite our hustle, sunset caught us up as we reached Towcester, and at Daventry we must needs light up; but anything for a quiet and comfortable ride.

There is something eerie in being transported through the dark on this magic seat, striking pot-holes and not having to complain.

Not a really long run, but enough to make one want to go further, and we're glad we went by road, for we feel sure that now we can conscientiously tell you of the luxurious ease it affords, and invite you at all costs (shock tactics, gas attacks, or whatever you like), to

Send for some literature, if you can't get to London.

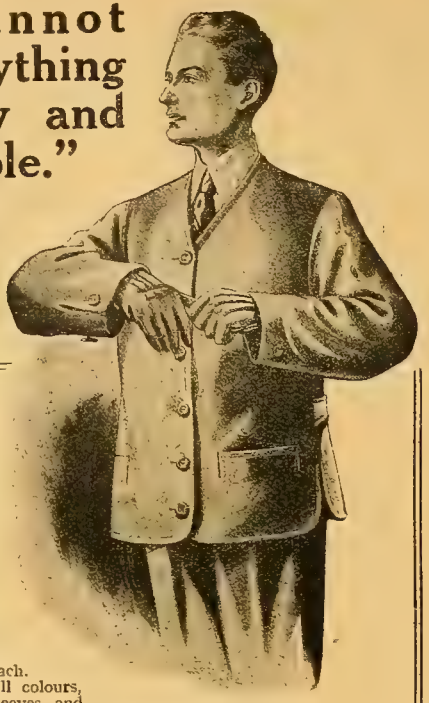
BROOKS
REGISTERED TRADE MARK

SADDLE.

J. B. BROOKS & CO., LTD.,
49, Criterion Works - BIRMINGHAM.

In answering this advertisement it is desirable to mention "The Motor Cycle." D27

"you cannot wear anything more cosy and comfortable."



9306 Tan Leather Waistcoat, as illustrated, single-breasted, two pockets. **£5 5 0** each.
2737/95 Ditto, without sleeves, **£4 4 0** each
2218 Chamois Leather Waistcoat, light and comfortable, single-breasted, cut specially long with windproof sleeves, **£6 6 0** each
9341 Tan Leather Waistcoat, double-breasted, turned fronts four pockets with flaps, lined wool, **£5 15 6** each.
2165 Wool Cardigan, all colours, single-breasted with sleeves and two pockets, delightfully comfortable and warm, from **42/-** each.

2349/95 Strong black Leather Jacket. A thoroughly well-made and serviceable garment and one that we can recommend **£8 8 0**
2350/95 Breeches of the same make and material ... **£5 5 0**
2303/80 Tan Leather Smock, single-breasted with wind flap, lined sateen **£8 8 0**
2343/80 Smock made of fleece **£3 3 0**
2993 Frieze Jacket with fixed tan leather lining ... **£7 7 0**
2993a Detachable leather lining **£8 8 0**
2911a Lined fleece ... **£5 5 0**
From Stock only.

We specialise in equipment for the motor cyclist and are always happy to quote for any garment made to a customer's own ideas.

Waterproof Jackets

2345/60 Double-breasted Jacket, 36" long, made in strong waterproof material, well-cut and smart in appearance, and very durable. In various weights and qualities. Patterns sent on application.

	Without Belt.	With Belt.
A	£3 3 0	£3 5 6
B	£2 15 0	£2 17 6
C	£2 5 0	£2 7 6

2344/60 Double-breasted Jacket with belt and saddle-piece, 42in. long, as illustrated, in various weights and qualities.

A	£3 10 0
B	£3 3 0
C	£2 12 6

There is no extra charge for garments made to individual measure. We can, however, give immediate delivery of stock sizes, while there is bound to be a delay of two or three days in the case of specially made garments.

MACKINTOSH LEGGING OVERALLS

Extremely comfortable and give absolute protection from wet. In various weights and qualities. Either clip or strap fastening as desired.

	2346/60 Trouser Overalls with seat	2347/60 Without seat	2348/60 Single Leg Overalls
A	£2 5 0	£1 17 6	£1 12 0
B	£2 0 0	£1 11 6	£1 8 6
C	£1 15 0	£1 7 0	£1 5 0

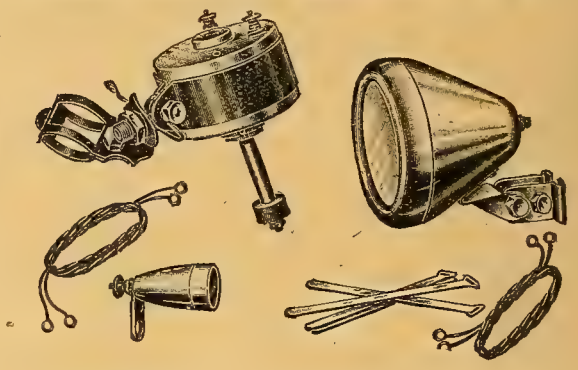
REMEMBER

That at Stand 226, Olympia, from Nov. 29th to Dec. 4th, the "ALTERNA" Outfits for cycle and motor cycle will be the only sets sold with a ONE YEAR GUARANTEE.

Descriptive pamphlets and demonstration at the Stand.



The Lighting SET that can be fitted by the OWNER.

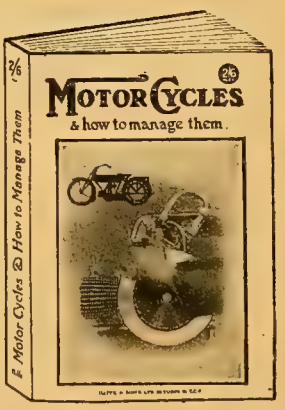
IMMEDIATE DELIVERY

of the "1921" Cycle Outfit: New head lamp with focussing device and parabolic reflector. Improved dynamo. Rear lamp. Sold complete with wiring and fittings, as illustration .. **52/-**

ALTERNACYCLE CO.,
89, FARRINGDON ST., LONDON, E.C.4

EVERY Motor Cyclist

Should possess a copy of this useful book



'Motor Cycles and How to Manage Them" is the standard handbook on the motor cycle; its care and management. It deals with every part of the machine, and with all types of machines, and gives useful information in regard to keeping every part in good order. 286 pages. 400 illustrations.

THE TWENTY-FIRST EDITION—revised and brought up to date—is now on sale.

Price 2/6 net; by post (Home & Abroad) **2/10**

Obtainable from—
ILIFFE & SONS Ltd, 20, Tudor St., London, E.C.4
AND LEADING BOOKSELLERS

British Petrol.

An announcement noticed on the Anglo-American Co.'s petrol lorries is to the effect that that company has purchased from the British Government the output of the new Hardtoft wells in Norfolk.

Death of Well-known Personality.

We regret to record the death of Mr. Walter Phillips, who was well known in the motor trade from its earliest days, and perhaps motor-cyclists will remember his name best in connection with Messrs. Humber, Ltd. Mr. Phillips died at Leamington on November 24th.

A "D.R." Reunion at Olympia.

All old M.C.O., D.R.'s visiting the Motor Cycle Show are arranging, if possible, to meet during the afternoon next Saturday, about 3.30, by the Scott stand. It is hoped that as many as possible will get together once again to discuss past and present events.

Motor Cycle Preferred to Car.

A Coventry motorist, who keeps both a car and a motor cycle, was surprised to find a few days ago that his garage had been forcibly opened, and, although the car remained, the motor cycle had disappeared. Skid marks on the road showed that the machine had been pushed for some 150 yards, apparently before it was discovered that a free engine position was available on the 1920 Triumph!

The London-Exeter Run.

We understand that a certain amount of difficulty is being experienced in arranging for meals *en route* in the London-Exeter run. The proprietor of the Bridge House Hotel, Staines, has undertaken to cater for a limited number of meals before the start and at the finish for those who notify the proprietor of their requirements before December 22nd. Breakfast will be provided at the Rougemont Hotel, which is about half a mile from the garage; the club is endeavouring to arrange transportation. At Salisbury the same accommodation as last year has been arranged.

Speed Trials in Italy.

Some kilometre speed trials have recently been held by the Milan Automobile Club, on the main road from Gallarate to Novara. The roads were muddy and in rather a poor state, nevertheless the performances were good. The results were as follows: 350 c.c. class—1, Garazini (Verus); 2, Fergnani (Clyno). 500 c.c. class—1, Carlo Maffeis (Bianchi); 2, Tettamanti (Norton). 1,000 c.c. class—1, Pietro Bordino (Harley-Davidson); 2, Genevrini (Indian).

Sidecar Taxi and Carrier Service.

A member of the Derby Rotary Club is carrying forward a scheme to employ ex-Service men by instituting a system of motor cycle taxis in the town, for the dual purpose of carrying passengers and parcels. It is proposed to buy twelve 8 h.p. outfits, and to make a popular fare of sixpence anywhere in the town. Theatres and all kinds of meetings would be catered for, and it is thought that the service would be of great advantage to the commercial traveller, who could hire a sidecar taxi to go into the country for about 25s. or 30s. a day.

London-Edinburgh Non-engine Stop Run

In addition to the activity at Brooklands, referred to on another page, demonstrations of roadworthiness were not absent on the eve of the Show. For instance, Rex Mundy last Thursday evening again set out for Edinburgh mounted on a 2¾ h.p. Coulson B sidecar outfit, having an A.C.U. observer as passenger, with the object of completing the trip to the Scottish capital without stopping the engine. In this he was successful, which is remarkable, considering his small Blackburne outside flywheel engine of 71×88 mm. bore and stroke, 348 c.c. The sidecar, complete with driver and passenger, weighed 6 cwt. 2 qrs. 21 lb., and in addition to this a certain amount of reserve petrol, oil and carbide was carried. Mundy arrived back at Olympia at the beginning of the week, and his sidecar outfit was the object of much attention in the environs of the Show.

London-Edinburgh without stopping the engine. R. G. Mundy, at the conclusion of his successful trip, repacking the tool bag of his 2¾ h.p. Coulson B. sidecar outfit.

What NOT to miss at Olympia—

The six-valve N.U.T.-J.A.P.

A ladies' sidecarette—the Cedos.

The Victoria £125 sidecar outfit.

The aero-model Morgan Runabout, and the polished chassis of the same make—a study in simplicity.

One of the best bargains in the Show—the 8 h.p. Vickers engined Enfield sidecar outfit at £182 complete with Lucas Magdyno.

The sidecar taxis or limousine sidecars on the Watsonian, Campion, Canoelet, and Rex stands—and listen to the mixed opinions of Show visitors!

The Cykelaid motor-assisted bicycle.

Bradshaw's oil-cooled engine on the Zenith.

The ingenious metal chain-belt on the Rudge stand, which should give variable gears a new lease of popularity.

The porting overhead valve Douglas.

The "scraper" adjustable footrests on the Royal Ruby.

The Coulson 4 h.p. three-speed spring frame "lightweight"—it weighs 196 lb.

The natty little Levises which weigh a hundredweight or so, and now give remarkable economy in fuel consumption.

The Scott "Squirrel"—a T.T. type of two stroke—later to be followed by the Weazel and the Stoat. N.B.—The "Squirrel" is intended to pick up the "knuts."

Paul Kelecom's latest production, the four cylinder three-speed F.N.

The New Hudson three-wheeled runabout.

The Millford "Rock" chassisless sidecar, which effects a great saving in weight and has withstood extensive tests in Australia.

The exhaust-vacuum lubrication system on the cheap Sheffield-Henderson sidecar outfit.

Mechanical oil pumps in profusion.

The Coventry Premier runabout, one specimen of which has two spare wheels.

The Abbottsford motor pony, a three wheeled scooter, evidently a grand child of the Motor Fric which was once seen at the Agricultural Hall.

The weatherproofing devices on sidecars which are a study in themselves.

The R.W. Scout, a miniature track racer.

The Excelsior Duplex, a new lightweight for either sex, said to be the lowest priced motor cycle at Olympia.

The Tan-Sad and Brooks seat suspension systems, splendid substitutes for spring frames.

A removable h.t. terminal on the Fellows magneto, which renders a machine "partially" thief proof.

The New Hudson red, white, and blue "semi" disc wheels.

The coming of the ratchet brake for sidecars.

The Economic flat-twin two-stroke cycle attachment, with combined ignition and lighting generator in the flywheel.

THE EVE OF THE GREATEST SHOW.

Manufacturers' Views of the Immediate and Future Outlook.

ON the eve of the Show, Friday, the 26th ult., the sixth annual banquet of the British Cycle and Motor Cycle Manufacturers' and Traders' Union, Ltd., was held at Princes Restaurant, Piccadilly, W. Mr. Alick S. Hill, J.P., the president, occupied the chair, and he was supported by a large gathering of trade celebrities. Generally, the tone of the speeches was one of confidence for the future. Proposing the toast of the "Cycle, Motor Cycle, and Allied Industries," the Rt. Hon. C. A. McCurdy, K.C., M.P. (Food Controller), paid a further tribute to the services rendered by the industry during the war. Its national reputation had been enhanced by British motor cycles, which had been proved an essential implement of war. Of the importance of the industry to the country, he instanced the extraordinary increase in British cycle and motor cycle exports compared to 1913. The president, responding, amplified those figures, quoting £8,000,000 as the exports for cycles and motor cycles during the ten months of 1920, a figure over double that of the total American exports of cycles and motor cycles. Thus, he emphasised, was the British cycle and motor cycle industry doing excellent work in endeavouring to redress the adverse trade balance. Remarking that there were signs that labour recognises the dependence of one section upon another and the promise of improved support in this direction, he paid a tribute to the co-operative work of the members of the Union which explained its success, thanks largely to the work of their manager, Major H. R. Watling. He touched upon the new firms who entered the industry subsequent to the war, remarking that it was unreasonable to expect to attain at a bound a leading position, only gained after long years of steady progress. Underproduction was what manufacturers were suffering from, not over-production, he urged.

A Precocious Offspring.

"The Guests" was proposed by Mr. H. Bowden, vice-president, who, in a witty speech, observed that the impending exhibition was to be the biggest ever held, and only exceeded in importance by their precocious offspring, the Society of Motor Manufacturers and Traders. Commander Viscount Curzon, M.P., in replying, mentioned his great interest in motor cycles. As soon as he was able to possess a motor cycle, he purchased many years ago a 1½ h.p. Quadrant, and "had a good run for his money." No country, he contended, could challenge the supremacy of the British motor cycle and cycle. The wonderful ability of despatch riders in France and the way their machines held together formed a constant source of admiration. He had much to say concerning grandmotherly legislation, and was doing his best to further road users' interests in Parliament. They had heard quite enough of what the Ministry of Transport were "going to do," but he asked, What had they actually done?

Speed and Police Traps.

Viscount Curzon denounced police traps, but readily acknowledged that the real danger occurred in travelling at speed in the wrong place at the wrong time. There was no chance of the abolition of the speed limit, he contended, and in that regard considered the Motor Legislation Committee's demands as excessive and unlikely to be acceded to. He further pointed out what has been noted in several quarters, viz., the unfortunate diversion of views between cyclists and motorists, particularly over the rear lamp question, though he personally plumped for the red rear light. Mr. E. S. Mays-Smith, president of the S.M.M.T., also replied, confining his remarks to the irksome and hampering legislation of the new Ministry of Transport. Waxing warm, he declared that many firms could not endure some of the burdens about to be imposed. It would all ultimately be reflected in the price of vehicles, which would have the effect of restricting demand. Thus, instead of encouraging the development of trade and giving factories a reasonable time to recover from the effects of war, the new restrictions would constitute a further serious handicap. Trade number plates he cited as an instance, though he had heard that day that a still further reduction was contemplated, the latest figures being £10 per set of plates for car makers, and 30s. for motor cycle manufacturers. Given a chance, the British cycle and motor industry had nothing to fear, but he insisted that the industry must be given reasonable time to recover.

A vote of thanks to the chairman, ably proposed by Mr. W. G. Bower, a vice-president, brought this highly successful function to a close. An attractive musical programme was interspersed with the toast list.

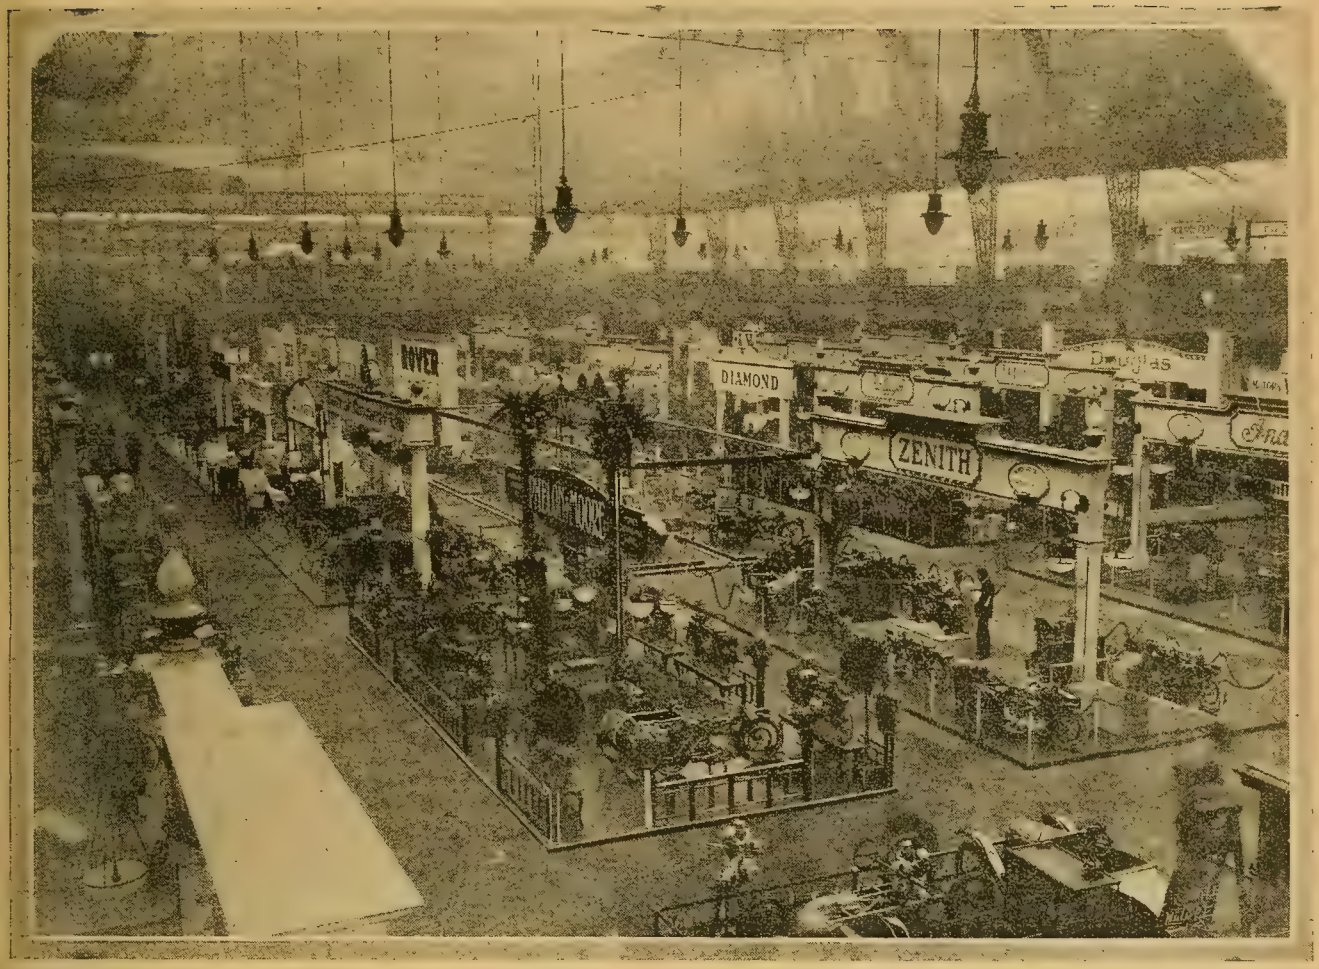
OLYMPIA IN 1920.



A general view of the Cycle and Motor Cycle Exhibition at Olympia. It is open daily from 10 a.m. to 10 p.m. until Saturday next, the 4th inst.

OLYMPIAN ACTIVITY AT BROOKLANDS.

THE proximity of the Show brought the customary crop of record aspirants to Brooklands last week. Four machines, including the Indian and sidecar, piloted by Le Vack, whose new figures we gave in detail on page 680, were successful in setting up new figures.

On November 26th D. Davidson, on a 7-9 h.p. Harley-Davidson and sidecar (engine dimensions 84.1 × 88.9 mm. = 988 c.c.), broke the fifty miles Class I. record, reducing the time to 43m. 29⅘s., equalling a speed of 68.97 m.p.h.

It will be noticed from the following tables that J. V. Prestwich, riding a new short-stroke Diamond J.A.P., on his second attempt succeeded in considerably lowering his own figures set up but two days previously for the five and ten miles distances :

November 11th, 1920.—J. V. PRESTWICH (2½ Diamond-Jap), 70 × 64.5 mm. = 249 c.c. Flying kilo. : 35.0s. = 63.91 m.p.h. (Class A). Flying mile : 56.6s. = 63.60 m.p.h. (Class A). Flying 5 miles : 5m. 17⅘s. = 56.67 m.p.h. Standing 10 miles : 10m. 43⅖s. = 55.97 m.p.h.

November 25th, 1920.—J. V. PRESTWICH (2½ Diamond-Jap), 70 × 64.5 mm. = 249 c.c. 5 mile (flying) : 5m. 3s. = 59.40 m.p.h. (Class A). 10 miles (standing) : 10m. 17.1s. = 58.33 m.p.h. (Classes A and A1). 50 miles : 53m. 45s. = 55.81 m.p.h. (Classes A and A1). 1 hour : 55m. 961yd. = 55.55 m.p.h. (Classes A and A1).

A New Hour Record.

Finally, Tudor Thompson performed a very similar feat. His new figures, the better if it be mentioned that his was an entirely unaided performance, are tabulated below. His mount was a new sporting 2¾ h.p. Douglas (60.9 × 60 mm. = 350 c.c.)—solo on the 17th and with sidecar on the 24th.

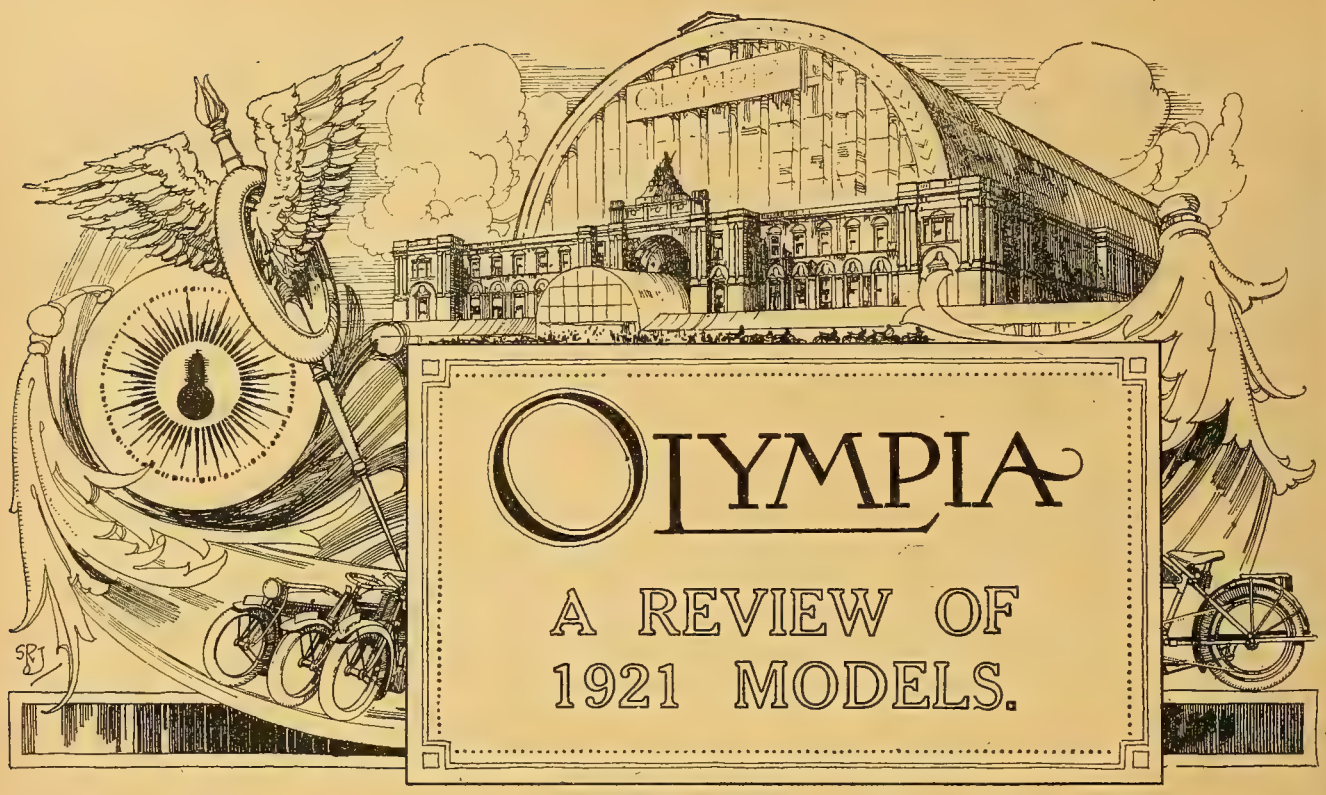
November 17th, 1920.—TUDOR THOMPSON (2¾ Douglas, 60.9 × 60 mm. = 350 c.c.). 1 hour : 63m. 696yd. = 63.39 m.p.h. (Record B).

November 24th, 1920.—TUDOR THOMPSON (2¾ Douglas, 60.9 × 60 mm. = 350 c.c.), with sidecar. 50 miles : 1h. 1m. 1⅘s. = 49.16 m.p.h. (Class F). 100 miles : 2h. 3m. 58⅘s. = 48.38 m.p.h. (Class F). 150 miles : 3h. 28m. 7⅘s. = 43.27 m.p.h. (Class F). 1 hour : 49m. 271yd. = 49.17 m.p.h. (Class F). 2 hours : 96m. 1,230yd. = 48.35 m.p.h. (Class F). 2 hours : 137m. 1,246yd. = 45.90 m.p.h. (Class F).

SIDECAR NOMENCLATURE

A CORRESPONDENT in *The Daily Mail* seeks a brief alternative term for "a motor bicycle and sidecar," suggesting that "motor bicycle and sidecar" is the unwieldy name by which sidecars are known. Evidently our friend is not well acquainted with the motor cycle movement, or he would know that the accepted term is "sidecar combination" or "sidecar outfit." Few, if any, adopt the longest way round. As a matter of fact the mention of "having seen a sidecar" is usually sufficient, as one would hardly expect to find a one-wheel arrangement careering about the streets, so that sidecar signifies motor bicycle and sidecar. One might add, for the benefit of the uninitiated, that "sidecarette" is the term applied to lightweight sidecars. If any better suggestions than these are the outcome of the enquiry, *The Motor Cycle* will be glad to hear of them.

As a matter of fact, the taxi sidecar badly needs a crisp term. We offer some suggestions on another page of this issue.



OLYMPIA

A REVIEW OF 1921 MODELS.

A STAND-TO-STAND DESCRIPTION OF MOTOR CYCLES, SIDECARS, AND THREE-WHEELERS ON VIEW AT OLYMPIA (Nov. 29th to Dec. 4th).

The reports and illustrations have been prepared by the staff of "The Motor Cycle" after personal examination of the exhibits.

A.J.S. (119.)

7 h.p.; 74×93 mm. (800 c.c.); V twin four-stroke; side-by-side valves; drip feed lubrication; Amac carburetter; chain-driven magneto; three-speed A.J.S. countershaft gear; all-chain drive; Dunlop 700×80 mm. tyres. Price: With sidecar £215; solo £159 10s.

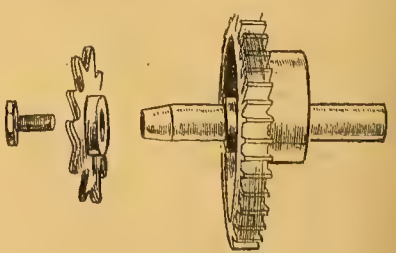
A. J. Stevens and Co. (1914), Ltd., Graiseley House, Wolverhampton.—Long famous as a machine embodying every luxury that care in design can provide, the new A.J.S. will even improve its reputation. For 1921 a larger engine is fitted with roller bearing big ends, a three-ring piston, and larger cooling fins. Also, an internal expanding front brake has been adopted, which is operated by pedal, thus doing away with the inverted handlebar brake levers. Primary chain adjustment has been elaborated, the gear box being moved backwards or forwards by a screw, which provides easy and accurate positioning. It is rather unusual that, although electric equipment is fitted, the makers prefer to keep it entirely distinct from the ignition. Instead, therefore, of fitting a Magdyno or similar instrument, they have installed a separate Lucas dynamo, driven by an enclosed Whittle belt, so that even should the lighting set fail the ignition remains unaffected. The mudguards fitted are so wide as to prevent any mud from reaching the rider, and it is typical of the care taken in detail that the holes where the forks pass through the front mudguard are lined with rubber washers to prevent any leakage of water or possible rattle. The detachable wheels remain, and it is to be observed that they are absolutely interchangeable, as the chain sprockets, brake drums, etc., all remain *in situ* when the wheel is removed.

On the A.J.S. the internal expanding front brake is operated by Bowden control.

What the Show Reveals.

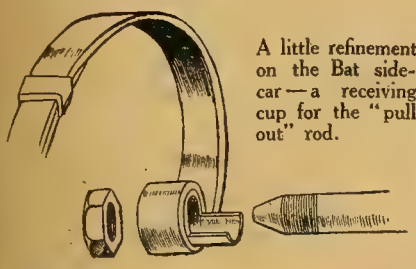
PROGRESS in 1920 is observable in many directions. "Tendencies in Design" (pages 672-676) reviews these improvements in detail. To assist our readers who are visiting the Show to assimilate the main items of interest, the outstanding features are summarised below:

(1) Improvements in cooling.
(2) A new British four-cylinder.
(3) Mechanical lubrication systems.
(4) New electric lighting sets.
(5) Weatherproof passenger machines.
(6) Improved saddle suspension.
(7) Novel two-stroke engines.
(8) More overhead valve engines.
(9) New countershaft gears.
(10) The large number of dual-purpose single-cylinder mounts.
(11) Lightweight sidecar outfits
(12) Novel frame designs.
(13) Increasing adoption of saddle tanks.
(14) Many new spring forks.



The magneto chain sprocket of the Blackburne is now fitted on to a tapered timing wheel shaft and locked by a small set screw.

The Olympia Show.—



A little refinement on the Bat sidecar—a receiving cup for the "pull out" rod.

Some improvements have been made in the sidecar, which will be fully dealt with in our next issue. The net result is to make the A.J.S. the most comfortable of machines, though not at the expense of speed.

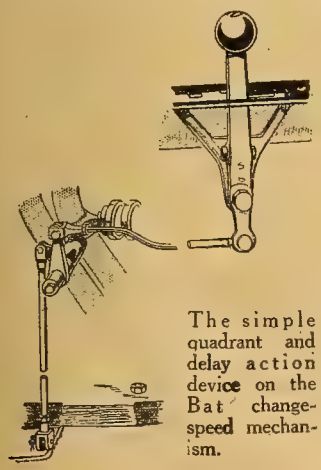
BLACKBURNE. (72.)

4 h.p.; 85×88 mm. (498 c.c); single-cylinder four-stroke; side-by-side valves; drip feed lubrication; Amac carburetter; chain-driven magneto; three-speed Burman gear; chain drive; 28×3in. tyres.

BURNEY AND BLACKBURNE, LTD., 28, Conduit Street, London, W.1.—A substantially constructed dual-purpose machine is the 4 h.p. Blackburne. It is fitted with 28in. wheels and all-chain drive, protected by a guard over the upper length of the chain. A contracting band foot brake operates on the rear wheel, and the pedal is conveniently situated on the off side. Brampton spring forks are a standard fitting, and the Blackburne engine is, of course, employed. As is well known, this popular power unit has an outside flywheel and a detachable cylinder head held in place by three long studs and nuts. The low riding position, large footboards, and wide handle-bars combine to give the rider a feeling of security, and the black finish is admirably set off by the red panelled tank.

8 h.p.; 85×88 mm. (996 c.c.); twin cylinder four-stroke; side-by-side valves; drip feed lubrication; Amac carburetter; T.B. chain-driven magneto; three-speed Burman gear; chain drive; 28×3in. tyres. Price £180.

Built essentially as a sidecar machine the 8 h.p. model has a V twin engine



The simple quadrant and delay action device on the Bat change-speed mechanism.

INDEX TO OLYMPIA EXHIBITS.

Descriptions of the various 1921 models at Olympia will be found on pages indexed below.

The new Connaught machines are fitted with a sound-proof, cast aluminium cover, enclosing the chain drive from the engine to the countershaft. Observe the heel brake, which is easily "found" by the foot on the footboard.

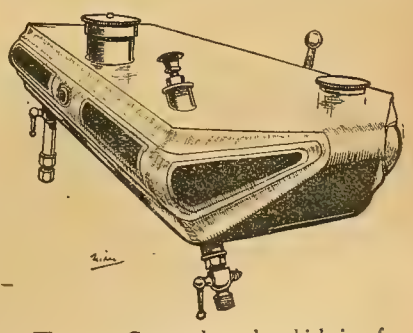
with cylinders set at 60°. In this engine also an outside flywheel and detachable cylinder heads are, of course, incorporated; another machine is built on very similar lines to the single-cylinder Blackburne model, although of sturdier construction with a heavier pattern Brampton spring fork. The final chain drive on this model is, at first sight, totally enclosed, but a closer inspection reveals the fact that the inner side of the chain case is absent. This chain guard, however, should be very effective.

Also on this stand are shown examples of the various Blackburne engines, and in addition to the 4 h.p. and 8 h.p. models, the 2¾ h.p. engine with a bore and stroke of 71×88 mm. is shown. The 5-6 h.p. engine is very suitable for a dual-purpose mount, and has similar cylinder dimensions to the 2¾ h.p. engine, and set at 60°. The 10 h.p. is shown as an air-cooled or water-cooled engine, the dimensions being the same, *i.e.*, 85×97 mm. An example of the air-cooled engine is shown with a skew gear-driven magneto.

BAT. (59.)

6 h.p.; 76×85 mm. (770 c.c.); twin-cylinder four-stroke; side valves; hand pump lubrication; Amac carburetter; chain-driven Magdyno; three-speed Sturmey-Archer gear; all-chain drive; 28×3in. tyres.

THE BAT MOTOR MANUFACTURING CO. (1918), LTD., Penge, S.E.—One of the pioneer firms of the motor cycle industry, the Bat has always had a high reputation, particularly for speed and workmanship. The 6 and 8 h.p. machines shown on the stand do not differ greatly from their predecessors, but all of them are good examples of the modern motor cycle, and



The new Connaught tank, which is of improved design and has a large capacity.

The Olympia Show.—

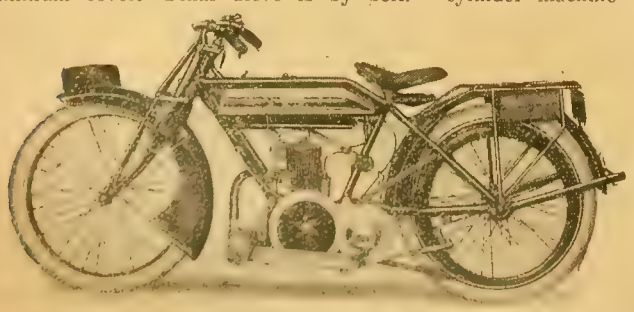
in particular of the method whereby the parts are arranged, so that even the smallest details are accessible. The ordinary model has a twin V engine driving the rear wheel through a countershaft gear box and clutch, transmission being entirely by chain. Both chains are covered in by metal casings of substantial and stiff design. Electric lighting is supplied, when desired, by a Lucas Magdyno placed at the front of the crank case, the wiring being rendered particularly neat by reason of the fact that the switch gear, enclosed in a casing, is bolted to a panel on the side of the petrol tank. Very stiff cast-aluminium footboards are used, and the tool bags on each side of the carrier are supported by steel casings. It is worth while studying the unusual suspension system, in which a powerful coil spring is linked to the seat-pillar, insulating the saddle and footboards from the remainder of the frame. The front forks are of Brampton design, so that the rider is thoroughly well sprung. The speed model is of the same type, even to the foot plates, but has curiously dropped handle-bars, giving an entirely different riding position. One of the chief exhibits on the stand is an extra wide two-seater sidecar frame attached to a touring model. The design is made still more interesting by the fact that the sidecar wheel is carried in a separate frame which is sprung on three-coil springs.

The 8 h.p. engine has a bore of 85.5 mm. and a stroke of 85 mm. Both engines are of J.A.P. manufacture.

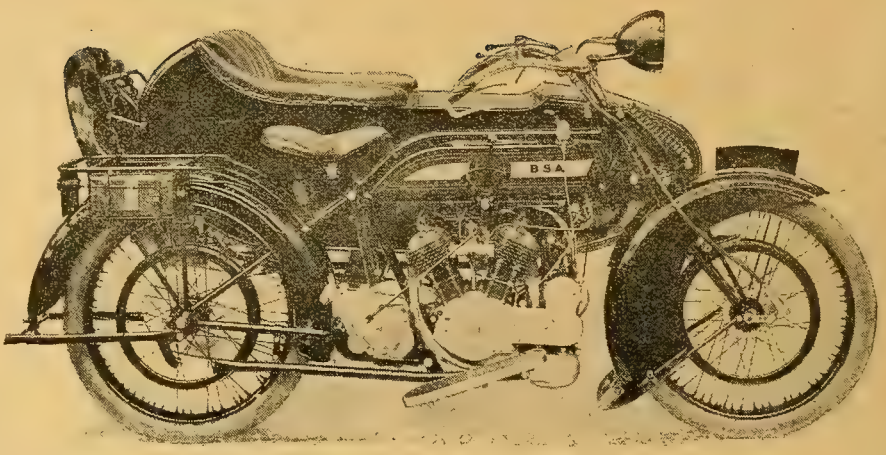
CONNAUGHT. (95.)

2½ h.p.; 73×70 mm. (293 c.c.); single-cylinder two-stroke; petroil lubrication; B. and B. carburetter; E.I.C. chain-driven magneto; two-speed Sturmey-Archer gear; chain and belt drive; Dunlop 26×2½in. tyres. Price with sidecar £100.

THE BORDESLEY ENGINEERING CO., LTD., Birmingham.—Quite the most attractive exhibit of the Connaught stand is the fascinating little sidecar outfit, for the performance of which we can vouch after an extended road test. Our readers will remember that the Connaught, which was a pioneer among two-strokes, has always embodied a combined inlet and exhaust manifold so that the incoming charge is well warmed. The engine is well constructed with ample bearing surfaces and drives by chain to a two-speed countershaft gear with handle-bar controlled clutch and kick-starter. This primary chain is protected by a neat cast aluminium cover. Final drive is by belt.



An early two-stroke in its modern form, the 2½ h.p. Connaught, with Sturmey-Archer gear box.



New type mudguards and many detail alterations are noticeable on the 1921 6 h.p. B.S.A.

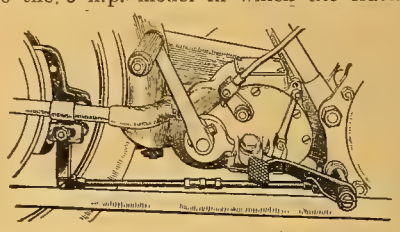
A metal shield prevents oily vapour spreading from the release valve, and the oil measure is now carried in a convenient position on the sidecar chassis. Neat and light is the little sidecar attached to the machine, which provides a wonderful amount of room for the passenger in spite of its apparently small outside dimension. The body is suspended on long leaf springs both fore and aft.

A similar machine can be supplied as a solo mount with or without clutch and kick-starter, while, in addition to this range, is a miniature machine with 24in. wheels and direct belt drive. This little machine is particularly suitable for ladies or young folk, since it is light and the essence of simplicity. A feature of Connaught two-strokes is the wonderfully economical consumption results which can be obtained by the ordinary rider without special tuning.

B.S.A. (69.)

4¼ h.p.; 85×98 mm. (557 c.c.); single-cylinder four-stroke; side-by-side valves; drip feed lubrication; B.S.A. carburetter; M-L chain-driven magneto; three-speed constant mesh gear; chain drive; 26×2½in. tyres.

B.S.A. CYCLES, LTD., Small Heath, Birmingham.—For single-cylinder sidecar work B.S.A. machines have made a reputation for reliability under hard usage. At the last Olympia Show, the company introduced a twin-cylinder model which has firmly established itself during the present year, and the same success is bound to follow the new single-cylinder machine which takes the place of the 4¼ h.p. model previously marketed. This new machine may be said to be a redesigned proposition, using the older model as its nucleus, so externally those familiar with the well-known single will not, at first sight, observe much difference between the old and the new models. There are differences, however, and all are to the good. First, perhaps, should be mentioned the redesigned timing gear which now embodies external cams which materially reduce mechanical noises. There are also several other points which have been improved with a view to obtaining a great degree of silence, a new and larger silencer being one of them. The bore and stroke of the engine remain as before, but a decompressor is now fitted which greatly facilitates starting. Chief among the other improvements is the gear box, which now follows the lines of that fitted to the 6 h.p. model in which the clutch



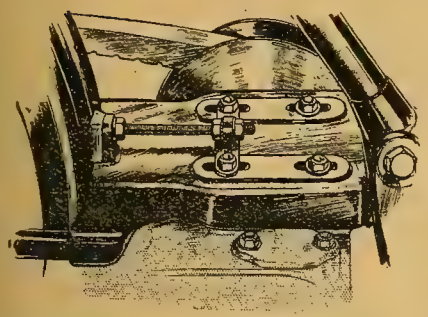
A desirable feature on the new B.S.A.—the straight pull of the rear brake operating lever.

is on the primary shaft and therefore quite inoperative when the gear is in neutral for starting purposes.

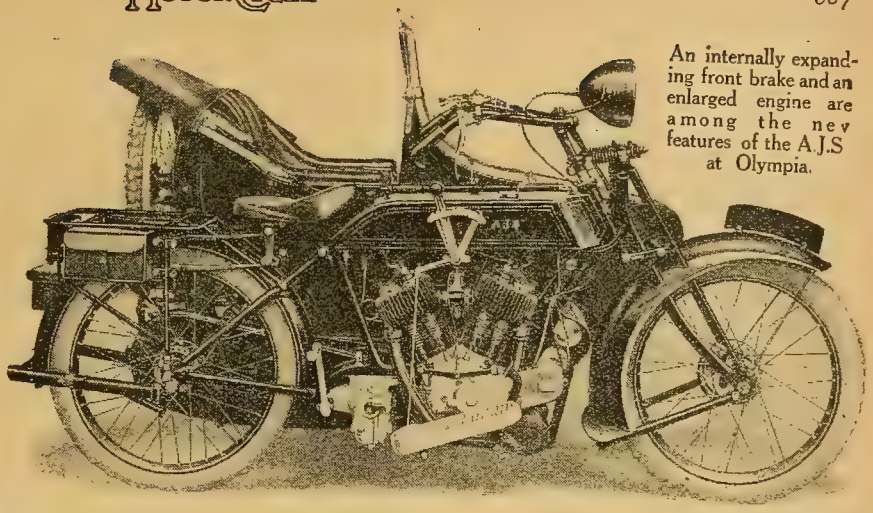
6-7 h.p.; 76×85 mm. (770 c.c.); two-cylinder four-stroke; side-by-side valves; suction feed and mechanical pump lubrication; B.S.A. carburetter; M-L chain-driven magneto; three-speed constant mesh gear; chain drive; 28×3in. tyres. Price £150.

Apart from the power unit there is but little difference in the two types, but larger tyres and wheels are fitted (28×3in.), and very large domed mudguards are a noticeable feature. A refinement on the engine is the mechanical lubrication, and the cast aluminium chain guards will also be observed. These guards are oil-tight, but can be detached for chain inspection quite easily.

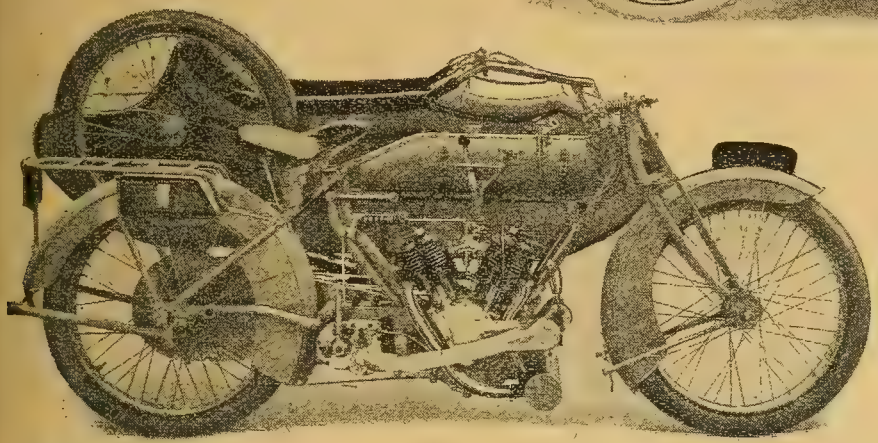
Partly sectioned models of both 4¼ h.p. and 6-7 h.p. engines are shown, and an open gear box makes clear the operation of the sliding dogs and the control mechanism. Improved forks, an almost invisible spring seat post, and superb finish are features of both B.S.A. models. The 3½ h.p. (500 c.c.) machine has temporarily dropped out of the lists.



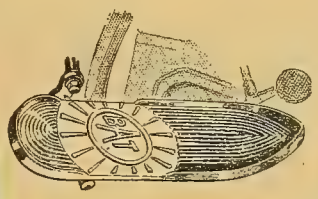
Gear box adjustment on the Armis sidecar mount is effected by a draw bolt.



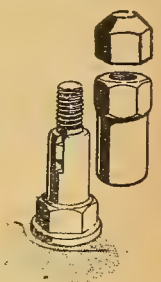
An internally expanding front brake and an enlarged engine are among the new features of the A.J.S at Olympia.



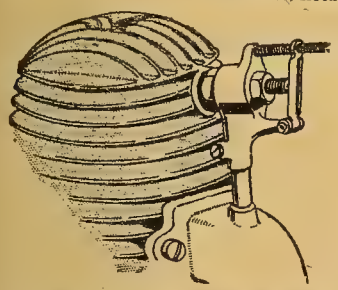
A Show would be incomplete without the Bat. The specimen illustrated is the 8 h.p. sidecar outfit, notable for its spring frame.



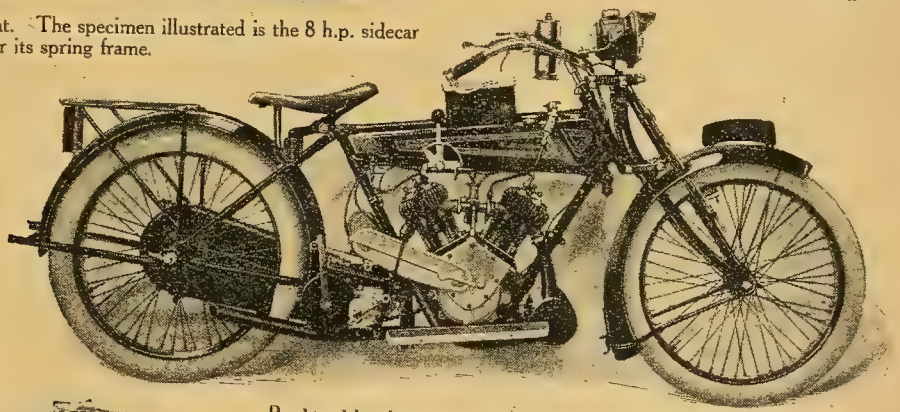
Large aluminium foot-plates are provided on the Bat



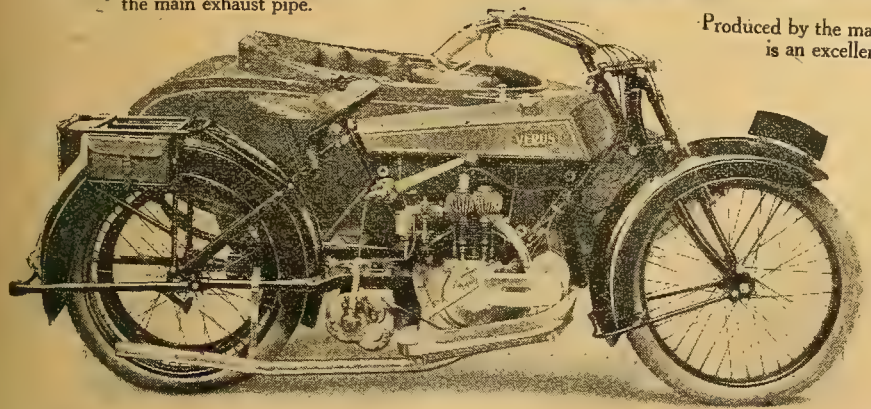
Details of the adjustable tappet fitted to the B S A.



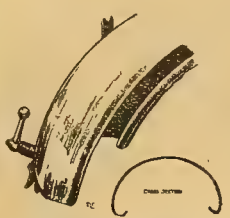
Radcos are fitted with a neat enclosed release valve and passage leading to the main exhaust pipe.



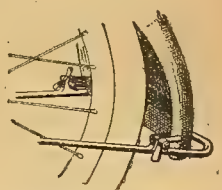
Produced by the makers of the well-known engine, the 8 h.p. Blackburne is an excellent example of clean and symmetrical design.



Wide mudguards and covers for the chain transmission and magneto contribute to the all-weather possibilities of the 4 h.p. Verus outfit, to which a saddle tank has been fitted.

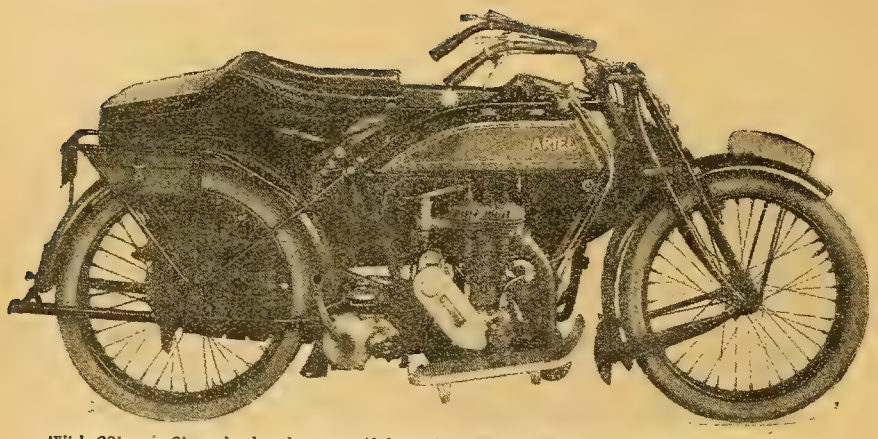


Channels are rolled in the new Triumph rear guard to carry away liquid mud.



The Verus front stand fixing clips on each side of the mudguard hold the stand in position.

The Olympia Show.—



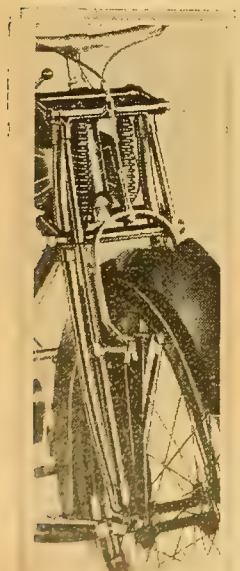
With 28in. × 3in. wheels, the new 4½ h.p. single-cylinder Ariel is a full size touring outfit. Observe the large locker at the rear of the sidecar, taking the place of a luggage grid.

ARIEL. (97.)

4½ h.p.; 86.4×100 mm. (585 c.c.); single-cylinder four-stroke; side-by-side valves; mechanical lubrication; B. and B. carburetter; chain-driven magneto; three-speed sliding pinion gear; chain drive; 28×3in. tyres.

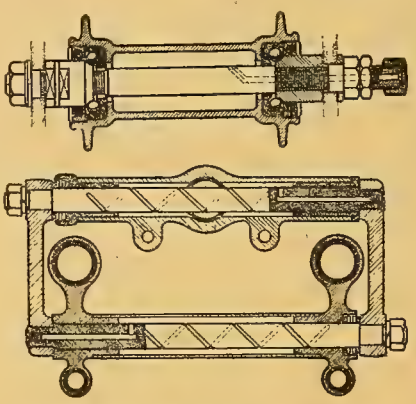
6-7 h.p.; 73×95 mm. (795 c.c.); twin-cylinder four-stroke; side-by-side valves; drip feed lubrication; B. and B. carburetter; chain-driven magneto; three-speed sliding pinion gear; chain drive; 28×3in. tyres.

Ariel Works, Ltd., Bournbrook, Birmingham.—Two new models are this year exhibited by this well-known Birmingham firm, and, except for the engines, the machines are identical. The 6-7 h.p. twin engine in one of these is little altered since the last Show, and is one of the few long-stroke twins on the market. The gear boxes, too, are as in the 1920 models, and are good examples of three-speed countershaft gears, in every way conforming to up-to-date practice. The 4½ h.p. single-cylinder engine is entirely new, embodying mechanical lubrication and a decompressor to facilitate starting. For this reason an exhaust valve lifter has been dispensed with. A plain bearing of exceptionally large diameter is used on the driving side main shaft, oil being led to it by ducts cast in the crank case.



Large forks and wide guards are notable features of the new models exhibited by Ariel Works, Ltd.

A massive steering head, particularly large forks, and a strongly-built frame rather higher than usual are the main characteristics of the machine itself, but close examination reveals that careful attention has been paid to lubricating the wheel hubs and fork links, which are drilled to permit a charge of oil being injected through their ends. The large tyres, spring seat-pillar, ample footboards, and wide guards are all points which add to the rider's comfort.



Sections of Ariel new front hub, spring fork, and shackle bearings, showing in each case, lubricating arrangements.

3½ h.p.; 86.4×85 mm. (498 c.c.); single-cylinder four-stroke; side-by-side valves; drip feed lubrication; B. and B. carburetter; E.I.C. chain-driven magneto; three-speed gear; chain and belt transmission; 26×2⅜in. tyres.

A solo machine of considerable attractions, the Ariel is well known for its prowess in trials, and also by reason of the fact that on this machine was introduced the decompressor. Of very compact build, the Ariel provides a low and comfortable riding position. A new design front fork has been evolved, and another feature which adds to the comfort of the driver is the special spring seat-pillar.

ALECTO. (147.)

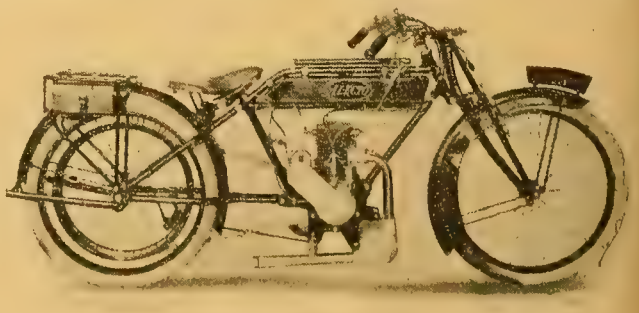
3 h.p.; 76×76 mm. (345 c.c.); single-cylinder two-stroke; drip feed lubrication; Amac carburetter; chain-driven magneto; two-speed Burman gear; chain and belt drive; Dunlop 26×2¼in. tyres. Price £87 10s.

Cashmore Bros., Grove Road, Balham, London, S.W.12.—Inspired no doubt by the fine performance of their small two-stroke engine at Brooklands, where it captured twenty-one long-distance records in August last, Messrs. Cashmore Bros. have gone very thoroughly into the question of lightweight sidecar work. The result of their investigation forms the chief exhibit on this stand—the specially designed 345 c.c. passenger outfit. This machine has a considerably stronger frame, a larger tank, wider footboards, bigger spring forks and a different type of mudguarding from the solo model, and sells at £125. Another addition to their range is a single-geared T.T. machine, so constructed, however, that it may be converted to a two-speed with Burman gear box, clutch, and kick-starter without any structural alterations. As far as the engine is concerned there are few modifications from last year's design. Oil leakage around the exhaust pipe flanges and compression release valve has been eliminated by an improved type of union. Castellated brass nuts now secure the twin exhaust pipes, while the release valve pipe is brazed into the valve body. Internally the Magnalium piston is retained; also the neat split big end with its white metalled bearing surfaces. Extremely neat is the primary chain cover, which leaves the clutch boss exposed for ready adjustment. The single geared T.T. model sells at £75.

SALTLEY. (175.)

4 h.p. Blackburne; 85×88 mm. (499 c.c.); single-cylinder four-stroke; side-by-side valves; B. and L. drip lubrication; Amac carburetter; chain-driven magneto; three-speed Sturmey-Archer gear; chain and belt drive; 26×2½in. tyres. Price £130.

Saltley Cycle Co., 86, Snow Hill, Birmingham.—The Saltley Cycle Co. stage three neatly designed machines, embodying the 4 h.p. Blackburne, the 2¾ h.p.



In view of its Brooklands performances, this T.T. Alecto should be very popular.

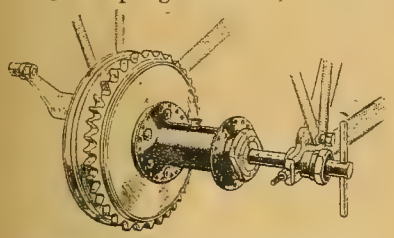
The Olympia Show.—

Vulcanus, and the 2½ h.p. Villiers power units. All three machines are excellent examples of the assembled type, and neatly finished in handsome colouring. The big 4 h.p. is an exceptionally good-looking machine, this in part being due to the use of a two-gallon tank of the "saddle" pattern, finely finished in khaki and black. The colouring of the Villiers model is similar; that of the Vulcanus is royal blue with black panels and gold lines.

CHATER-LEA. (90.)

2¼ h.p.; 70×70 mm. (269 c.c.); single-cylinder two-stroke; drip feed lubrication; Amac carburetter; T.B. chain-driven magneto; two-speed countershaft gear; chain and belt drive; 26×2in. tyres. Price £70.

CHATER-LEA, LTD., 74, Banner Street, London, E.C.1.—A pleasing looking little lightweight of standard design is the 2¼ h.p. Chater-Lea, black and gold finish being employed. Mudguarding has been particularly well carried out, and the sloping top tube provides a low riding position and neat appearance. A lever control for the magneto is fitted to the tank, which also carries a Best and Lloyd drip feed lubricator. Special Chater-Lea spring forks are, of course,



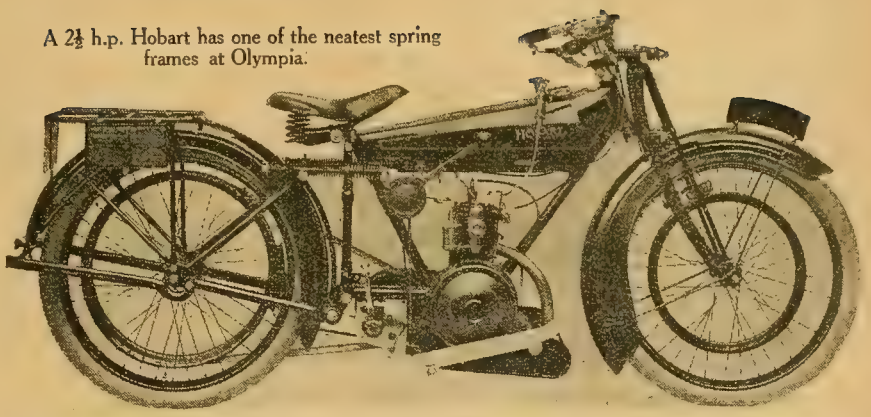
Rear axle assembly of the Chater-Lea, showing the driving pins between the chain wheel and the rear wheel hub.

fitted, and a single toolbag is carried on the near side of the carrier. The countershaft gear box is particularly well carried out, and is controlled by a lever and quadrant on the left side of the tank.

8 h.p.; 85×85 mm. (964 c.c.); two-cylinder four-stroke; side-by-side valves; drip feed lubrication; Amac carburetter; T.B. chain-driven magneto; three-speed sliding gear; chain drive; 700×80 mm. tyres.

A luxurious sidecar machine is seen in the 8 h.p. Chater-Lea twin. It is of

A 2½ h.p. Hobart has one of the neatest spring frames at Olympia.

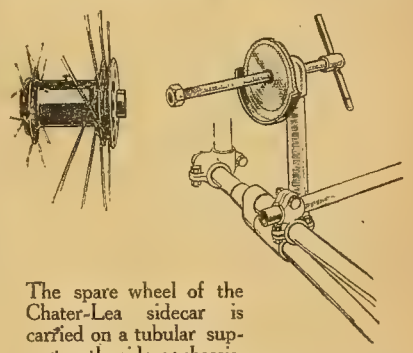


sturdy construction, and a good feature is the fitting of over-sized tyres, all wheels being detachable and interchangeable. A spare wheel is carried at the front of the sidecar chassis by a special lug provided for the purpose. The chain transmission throughout is well guarded, but is not totally enclosed. Features which call for inspection are the special Chater-Lea spring saddle mounting and spring fork. It is claimed that the combination of the two results in an exceptionally comfortable machine. The power unit is on standard lines, as also is the countershaft gear box. The chain sprocket has combined with it a large drum in which is an expanding brake. Finished in black and gold, the tank accommodates 2½ gallons of fuel, but, owing to the rounded corners, it does not appear unduly large. A large cylindrical silencer, with an extension pipe, ensures the quiet running of the machine. If desired, a Lucas Magdyno may be fitted with electric lighting equipment, this being, of course, an extra. A particularly simple method of detaching the interchangeable wheels is used.

HOBART. (102.)

2½ h.p. Villiers; 70×70 mm. (269 c.c.); single-cylinder two-stroke; petroil lubrication; Amac carburetter; flywheel magneto; single-speed gear; belt drive; 26×2½in. Hutchinson tyres.

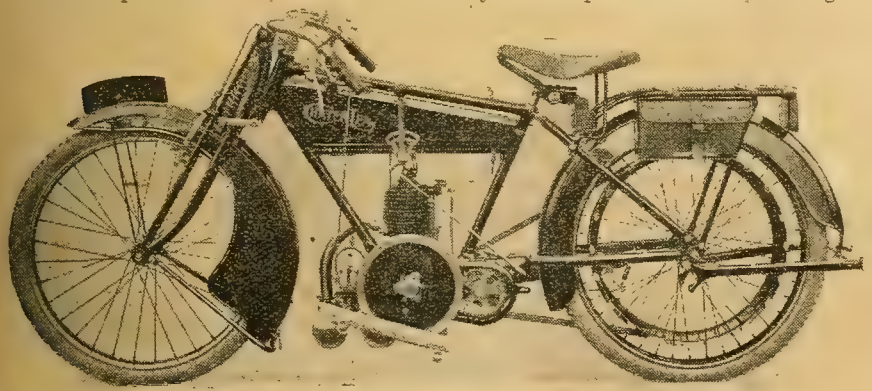
HOBART CYCLE CO., LTD., Coventry.—This machine is the simplest and most inexpensive of the wide range of Hobarts—all lightweights. Petroil lubrication has been adopted only this year, and only for this particular model. Owing to the design of the bottom bracket, which is specially slotted for this purpose, a Chater-Lea two-speed gear box may be fitted without any structural alterations. Should, therefore, the purchaser of a single gear Hobart desire later to go in for serious touring or mountaineering in a small way, he will be able, given the necessary sprocket, etc., to effect a conversion himself in a very short space of time.



The spare wheel of the Chater-Lea sidecar is carried on a tubular support on the sidecar chassis.

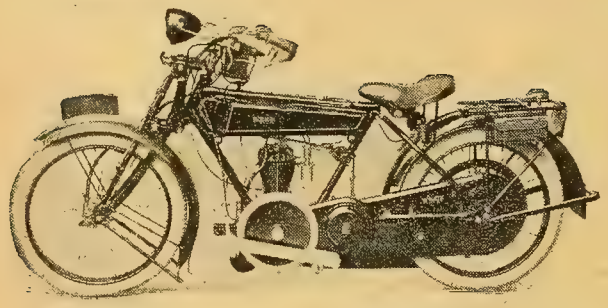
2¾ h.p.; 70×76 mm. (293 c.c.); single-cylinder four-stroke; side-by-side valves; drip feed lubrication; Amac carburetter; C.A.V. chain-driven magneto; two-speed Sturmey-Archer gear; chain and belt drive; Dunlop 26×2½in. tyres.

Chief model of an old-established Coventry firm, the spring frame Hobart is an excellent little job, both in design and finish. Pivoted immediately behind the gear box, the rear stays form the base of the duplex triangle supporting the back wheel. Carrying on the explanation geometrically, the apex of this triangle slides along two horizontal (loosely linked) rods pivoted underneath the saddle. The motion is controlled by compression and tension coil springs on these rods. In practice, this gives a neat and efficient suspension, which has incidentally been proved on the road for over a year. A similarly sprung machine may be obtained with a 2½ h.p. Villiers engine, and both are shown with rigid frames. Staging lightweight machines of all types from the simple single-geared two-stroke to a *de luxe* model with spring frame, clutch, and kick-starter, the Hobart Cycle Co. are in a position to produce a machine to suit any rider.

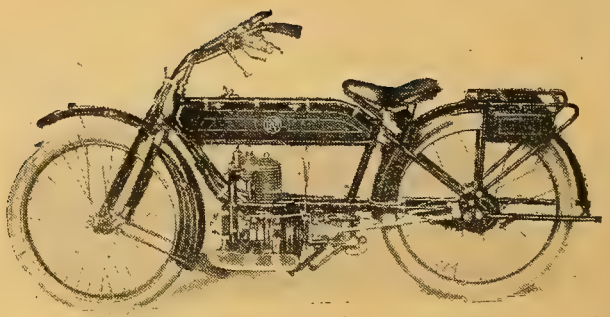


Very fine front mudguarding immediately attracts notice on the Chater-Lea lightweight.

The Olympia Show.—



For all-weather work the 4 h.p. Wilkin-Blackburne makes a strong appeal.



2¾ h.p. F.N. singlecylinder two-speed modele de luxe.

WILKIN. (146.)

4 h.p. Blackburne; 85×88 mm. (499 c.c.); single-cylinder four-stroke; side-by-side valves; drip feed lubrication; Amac, B. and B., or Senspray carburetter; chain-driven Magdyno; three-speed Sturmey-Archer gear; all-chain drive; Wood-Milne or Hutchinson 26in.×3in. tyres. Price £190 with sidecar.

WILKIN MOTORS, LTD., Onslow Road, Sheffield.—The officially observed "Round the Coast" test is still fresh in the minds of the public; and just as surely have the lessons of that test been utilised by Wilkin Motors. Mudguarding has been much improved and strengthened, and the chain cases are designed to be completely mud and waterproof; albeit they detach with little trouble. Specially thoughtful is the provision of a means of clipping the chains in position, and thus avoiding much irritating "fishing" in the lower half of the gear case when shortening the chain. The gear box is adjusted by means of a special plate attached to the holding-down bolts, which plate may be moved forward or backward by screwing a double-flanged nut abutting on a lug cast in the bottom bracket. Magneto chain adjustment is made easy in a somewhat similar manner.

2¾ h.p. Blackburne; 71×88 mm. (349 c.c.); single-cylinder four-stroke; side-by-side valves; drip feed lubrication; Amac or Senspray carburetter; chain-driven magneto; three-speed Sturmey-Archer gear; enclosed chain drive; 26in.×2¼in. tyres. Price £122.

It may be recalled that the 2¾ h.p. Wilkin distinguished itself in the Scott and Ilkley trials—two abnormally severe events. The chief features of the 4 h.p. model also apply to this machine, which is also shown as a light sidecar outfit. A specially tuned sporting model with T.T. bars and footrests completes a fine range of machines that we expect to see much in evidence in 1921.

F.N. (139.)

7 h.p.; 52×88 mm. (748 c.c.); four-cylinder four-stroke; valves on either side; mechanical lubrication; Amac carburetter; gear-driven magneto; three-speed gear; shaft and bevel drive; Palmer Cord 26in.×3in. tyres.

F.N. (ENGLAND), LTD., Kimberley Road, Willesden Lane, London, N.W.8.—Belgium has always been noted for its engineering products, particularly for the excellence of its foundry work, and it is rather disappointing that only one Belgian motor cycle manufacturer is seriously represented in this country. However, the good points of that one make—the F.N.—probably compensate for lack of variety. From very early days the F.N. four-cylinder has been steadily carving a niche for itself in the heart of the British public, and the latest 7 h.p. model possesses several features as yet unique, but which are considered by many as likely to become almost universal in the future. Modern car practice is followed throughout. Oil level in the sump of the air-cooled four-cylinder engine is kept constant by a mechanical pump possessing a visible indicator. At the end of the massive crankshaft, which is supported on ball bearings, is a proportionally massive flywheel containing a multi-disc clutch. Thence the drive is through a ball-bearing three-speed gear box, by partly enclosed shaft and bevel to the back wheel. Although amply strong and powerful for sidecar work, this model, in view of its specification, is remarkably light, and its even torque and large tyres make it a fascinating and comfortable solo mount.

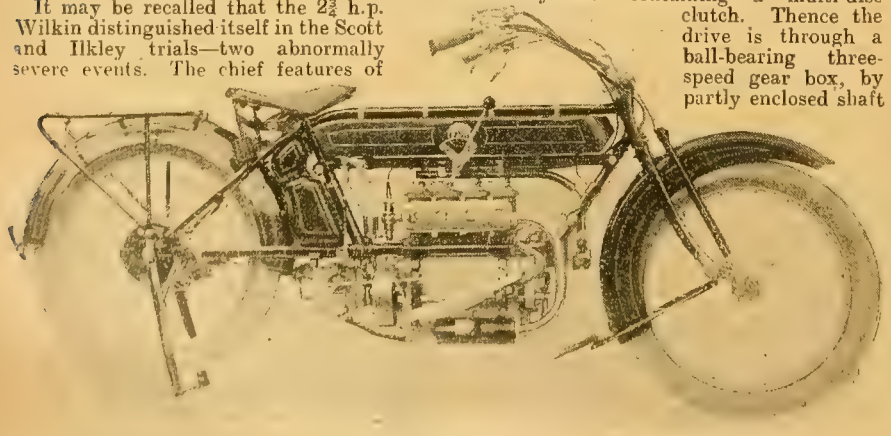
2½ h.p.; 65×86 mm. (275 c.c.); single cylinder four-stroke; side-by-side valves; Amac carburetter; gear-driven magneto; two-speed gear; shaft and bevel drive; Palmer Cord 26in.×2¼in. tyres.

When chain drive is being regarded by some as advanced practice if applied to a lightweight, it is well to remember that the 2½ h.p. F.N. has embodied shaft and bevel drive since its inception. A transversely set engine makes this layout not only possible but very neat. The cylinder and top half of the crank case form one casting, the valves are interchangeable, and the timing gear employs only two pinions, including the magneto drive. All this is illustrative of the great simplicity of the design. As in the "four," an outside flywheel carries a multi-plate clutch (handle-bar controlled); and the two-speed gear box and kick-starter are entirely of F.N. manufacture.

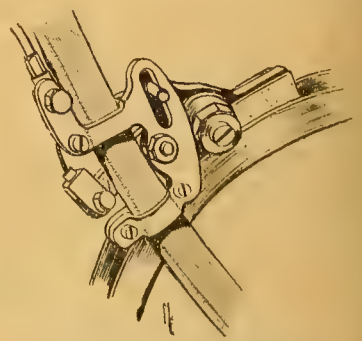
ZENITH. (87.)

3½ h.p. Bradshaw; 68×68 mm. (499 c.c.); horizontal twin-cylinder four-stroke; overhead valves; mechanical lubrication; B. and B. carburetter; gear-driven magneto; Zenith-Gradua gear; belt drive; Avon 26×2¼in. tyres. Price (provisional) £130.

ZENITH MOTORS, LTD., Hampton Court.—Probably the greatest attraction on the Zenith stand is the new Bradshaw-engined sporting machine. The engine

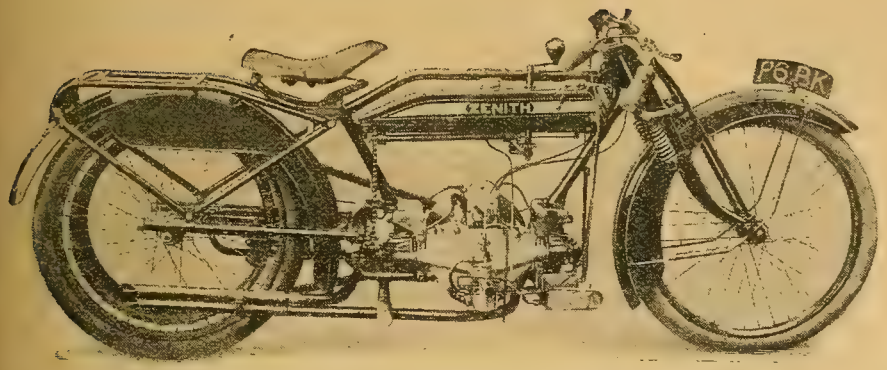


New model 7 h.p. four-cylinder F.N., with three-speed gear and shaft drive—a car on two wheels.

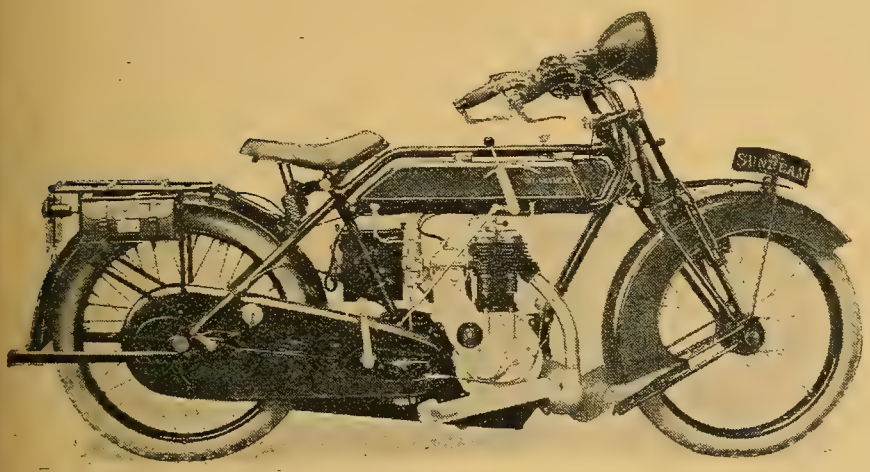


Zeniths now have a cable-operated dummy belt rim front brake

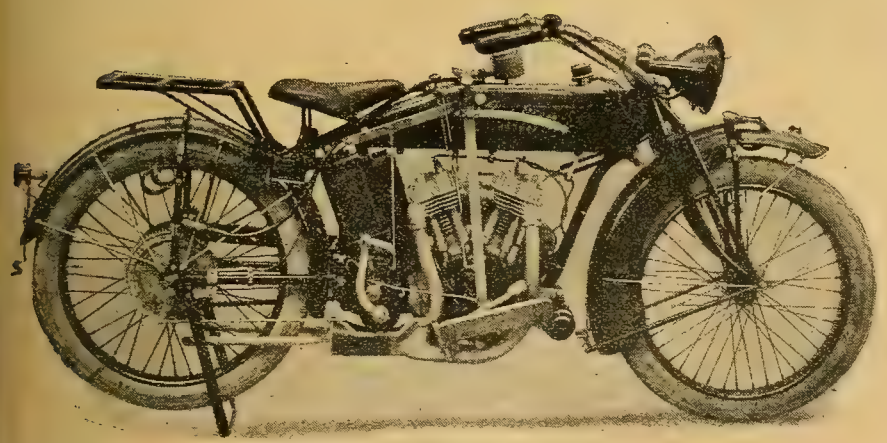
Divergent Types of Solo Mounts.



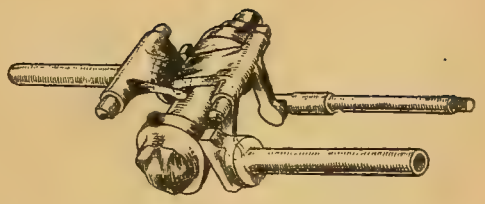
A sporting model Zenith fitted with the Bradshaw flat twin engine is one of the real novelties of the Show. Note the unusual crank-case construction.



1921 model 3½ h.p. three-speed Sunbeam, fitted with Lucas Magdyno, a fine specimen of an all-weather solo mount.

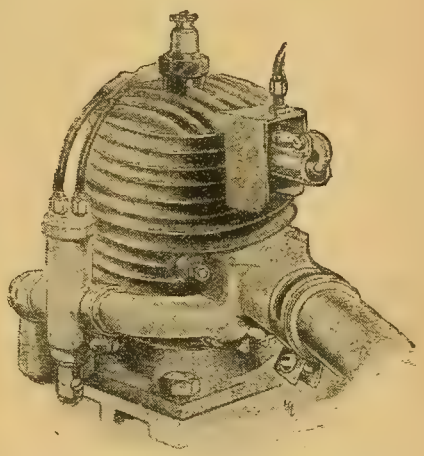


7 h.p. Indian Powerplus, a stripped model of which last week exceeded 95 m.p.h. at Brooklands.

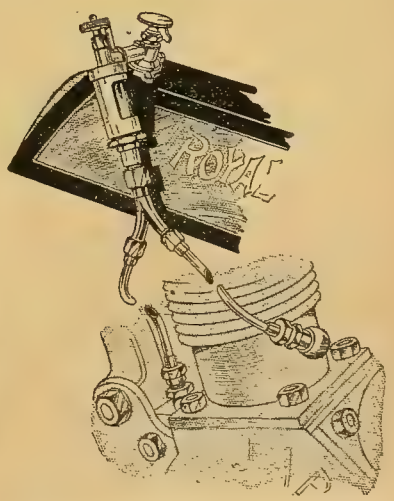


Details of the new 3½ h.p. Douglas cam and valve rocker mechanism.

Troughs to carry water to the rear are provided on the Zenith back mudguard (shown detached)

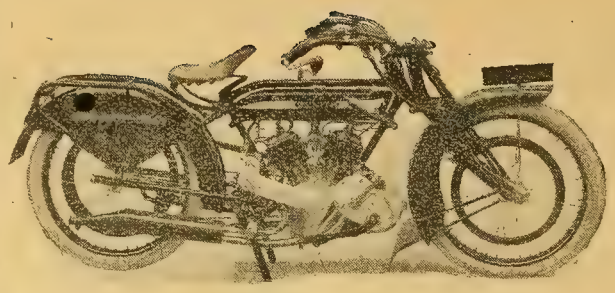


The Connaught cylinder, showing combined exhaust and inlet manifold.



The lubrication system of the Royal Ruby provides a supply of oil to the rear of the front cylinder.

The Olympia Show.—of this may be regarded as the first attempt at really scientific oil-cooling. As has already been described in *The Motor Cycle*, the cylinders are sunk inside the crank case, only the heads being exposed. The forced-feed lubrication pump provides a constant stream of oil from a separate tank in which it is kept cool, and the cylinders and pistons are cooled as well as lubricated by this oil, which is then returned by a second pump from the crank case into the oil tank. The preliminary tests of the model (which will not be in production until February) show it to be possessed of a very good turn of speed as well as pulling power, and it will certainly become immensely popular with those who prefer a sporting solo machine of high performance.



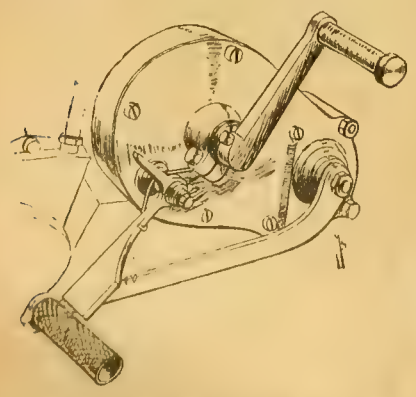
An 8 h.p. Zenith Gradua with Barnes saddle. Observe the dummy belt rim brake for the front wheel.

2¾ h.p.; 58¼×65 mm. (346 c.c.); two-cylinder flat twin four-stroke; side-by-side valves; hand pump lubrication; Amac carburetter; gear-driven magneto; Zenith Gradua gear; chain and belt drive; 26in. ×2¼in. tyres. Price £107.

This light sporting model remains practically as it was, it having been found so fully up to its work that no alteration is needed. It is a fascinating solo mount, and makes a great appeal to those who find that 350 c.c. gives them the performance they require.

5 h.p.; 70×85 mm. (654 c.c.); two-cylinder V twin four-stroke; side-by-side valves; hand pump lubrication; Amac carburetter; chain-driven magneto; Zenith Gradua gear; belt drive; 650×65 mm. tyres. Price £123.

This model, also the heavier sporting models "E" with 6 h.p., and "G" with 8 h.p., engines (both of which are priced at £139), resemble the 2¾ h.p. flat twin, in being practically unaltered; they are too well-known to need further description. It should be added, however, that improvements have been embodied in details, particularly in the direction of mudguarding. The 8 h.p. clutch model with countershaft, which is priced at £162, has a new and excellently arranged clutch pedal of very long leverage, with a ratchet pawl to hold the clutch out if desired.

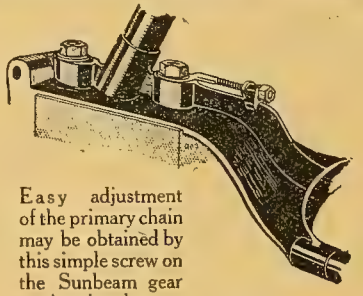


Delicate clutch manipulation is made possible on the Zenith by means of an exceptionally long pedal.

SUNBEAM. (129.)

3½ h.p.; 85×88 mm. (499 c.c.); single-cylinder four-stroke; side-by-side valves; drip feed lubrication; Amac or B. and B. carburetter; chain-driven magneto; three-speed constant mesh type gear; enclosed chain drive; Dunlop or Bates 650×65 mm. tyres. Price £155 8s.

JOHN MARSTON, LTD., Sunbeamland, Wolverhampton.—Although the capacity of the Sunbeam single-cylinder engine is only 499 c.c., it has proved capable of the severest sidecar work, and for dual purposes it stands in the highest rank. Famous long ago on Sunbeam pedal cycles, the oil bath gear case forms the most prominent feature, although the three-speed gear box is also a very fine piece of work. Of course, the rear wheel is instantly detachable without disturbing the drive or gear cases in any way. Laminated front springing was first adopted on this model last year, and is retained both in standard and in T.T. version, the latter differing only in the substitution of dropped bars and footrests. This T.T. machine must not be confused with Messrs. John Marston's commendable attempt to provide a really fast and light solo mount, not dissimilar to the machine which won the 1920 Senior T.T. In this machine weight has been sliced off wholesale, leaving only those features which will delight the heart of the speedy soloist. Parallel link forks, a lighter gear box without kick starter, simpler braking on dummy belt rims, all contribute to the good cause of decreased weight; while a special aluminium piston should mean increased efficiency. The transmission system is unaltered, and the sporting Sunbeam is priced at £152 5s.



Easy adjustment of the primary chain may be obtained by this simple screw on the Sunbeam gear box bracket.

The Sunbeam seat pillar lug.

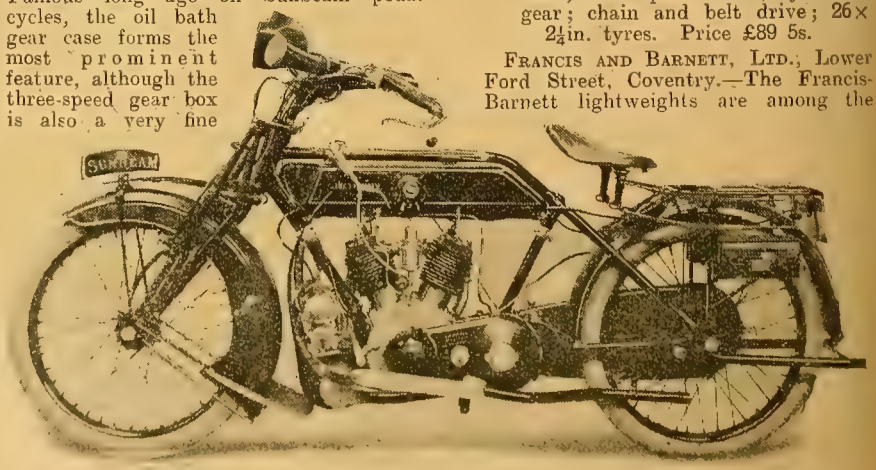
8 h.p. J.A.P.; 85.5×85 mm. (976 c.c.); V twin cylinder four-stroke; side-by-side valves; drip-feed lubrication; Amac or B. and B. carburetter; chain-driven magneto; three-speed constant-mesh type gear; enclosed chain drive; Dunlop 650×65 mm. tyres. Price with sidecar £237 6s.

For those who desire a great reserve of power for really heavy passenger work the well-known J.A.P. engined outfit is still a centre of attraction. Following very closely the general lines of the smaller touring machine, it holds an enviable position in its class, and for 1921 has not been altered. Large mudshields and the new Brooks cantilever saddle are fitted.

FRANCIS-BARNETT. (34.)

2¾ h.p.; 70×76 mm. (292 c.c.); single-cylinder four-stroke; side-by-side valves; splash lubrication; B. and B. carburetter, chain-driven magneto; two-speed Sturmey-Archer gear; chain and belt drive; 26×2¼in. tyres. Price £89 5s.

FRANCIS AND BARNETT, LTD., Lower Ford Street, Coventry.—The Francis-Barnett lightweights are among the



1921 model Sunbeam-Jap three-speed chain-driven sidecar mount. Observe the Brooks special saddle suspension.

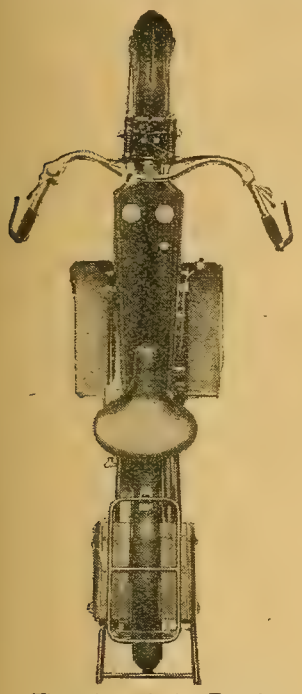
A postcard will do.

Prices' Company Limited,

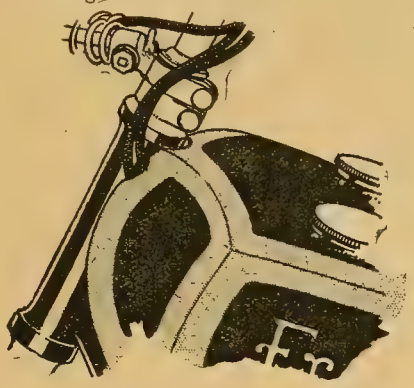
BATTERSEA, LONDON, S.W.11.

The Olympia Show.—prettiest in the Show, and one interesting result of the 1921 taxation scheme is that the makers are careful to state the exact weight of all their models. With empty tanks and without lamps or tools, the weights range from 152 lb. for the single-speed two-stroke, to 195 lb. for the *de luxe* model, fitted with J.A.P. engine. The handsome aspect of the machines on this stand may be ascribed to an excellent quality of finish and to



This view of the Francis-Barnett is difficult to obtain at Olympia, but serves to show an attraction of its saddle tank.

tasteful colouring, the black tank being heavily lined in scarlet and lettered in gold. Moreover, this tank is of the "saddle" type, giving a flush finish to the top. The designer understands that quite seventy-five per cent. of the people who ride lightweights like to have a clutch and kick starter, which he accordingly fits to all his variably-geared models. Metal-rimmed footboards covered with linoleum are standard, and on the *de luxe* model a pair of efficient legshields is included. With these extras the machine is catalogued at £105.



Clean outline is obtained on the Francis-Barnett by leading the control wires inside the saddle tank.

A similar machine to the four-stroke is the two-stroke model, which is engined with a 2½ h.p. Villiers engine, and sells at £70 7s. single gear, and £80 17s. with two-speed gear.

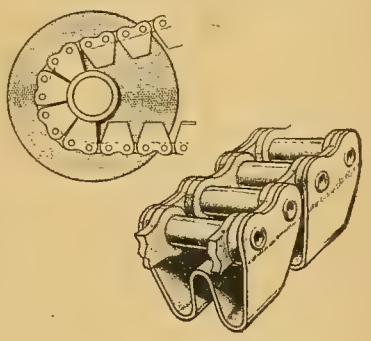
RUDGE. (113.)

3½ h.p.; 85×88 mm. (499 c.c.); single-cylinder four-stroke; inlet over exhaust valves; pump lubrication; Senspray carburetter; gear-driven magneto; variable speed gear; belt drive; 650×65 mm. tyres. Price £110 5s.

RUDGE-WHITWORTH, LTD., Coventry.—It is interesting that the makers of the Rudge, as one of the few remaining exponents of the all-belt drive, have fitted an all-metal chain-belt to some of their latest Multi models. This belt is in effect a wide chain, to the links of which are attached sprung V shaped gun-metal plates, shaped to fit the belt pulley. The weight is roughly twice as great as that of the normal belt, but against this increase must be set the fact that the drive is slip-proof, being unaffected by water. Otherwise both this and the 5-6 h.p. long stroke model remain unaltered. The technical details of the 5-6 h.p. model are exactly similar to those of the 3½ h.p. with the exception of the engine stroke, which is 132 mm.; and the price, which is £120 15s. There is also the 8 h.p. "Multwin," the engine of which is similar to the model described below, while the transmission, etc., is of the well-known Multi variable pulley type. In this, movement of a lever on the tank side opens or closes the variable belt pulley, at the same time actuating a connecting rod, which keeps the belt tension constant by closing or opening the rear wheel belt rim. To adjust the belt tension, the rear belt rim alone is altered, by a small hand lever set on the spindle end. On an extension of the engine-shaft beyond the pulley is placed a multi-plate clutch, operated by a Bowden wire and handlebar lever.

7-9 h.p.; 85×88 mm. (998 c.c.); V twin four-stroke; inlet over exhaust valves; hand pump lubrication; Senspray carburetter; gear-driven magneto; three-speed Rudge sliding gear; all chain drive; Dunlop 650×50 mm. tyres. Price £167.

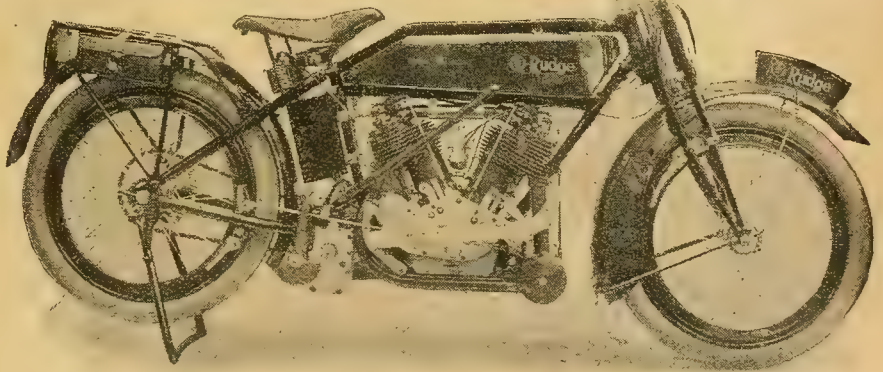
In this new model Messrs. Rudge-Whitworth, Ltd., have broken away



The Rudge experimental all-steel belt is, broadly speaking, a chain with spring bearing faces.

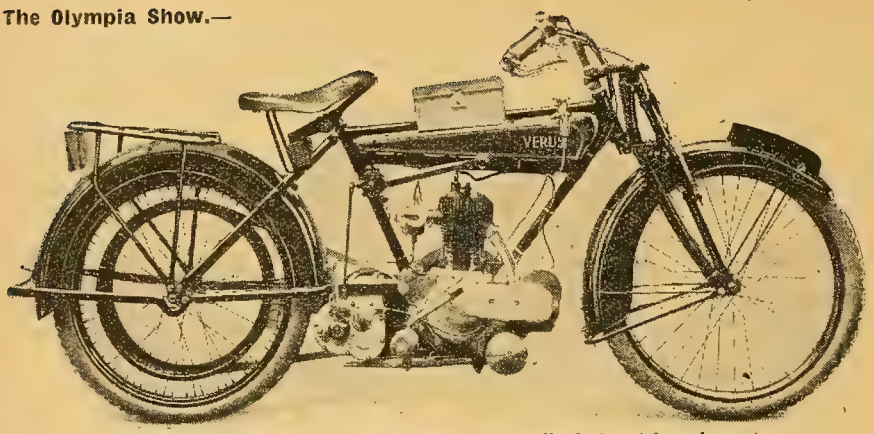
from their old tradition, and have incorporated a three-speed gear box of very neat design. It includes a kick-starter, but no clutch, as the makers have preferred to retain their well-known engine-shaft clutch, with which they have incorporated a cushion drive, consisting of two serrated discs or face

An easy adjustment and a parallel action are provided for the Francis-Barnett rear brake.



7-9 h.p. twin Rudge with three-speed countershaft gear and all-chain drive. Its features were described in detail in our last issue.

The Olympia Show.—



A light and handy 4 h.p. Verus-Blackburne, specially designed for solo work.

cams, held together by a spring. As the drive has to pass from one disc to the other, any "snatch" is taken up by one disc tending to climb the teeth of the other, against the spring pressure.

VERUS. (161.)

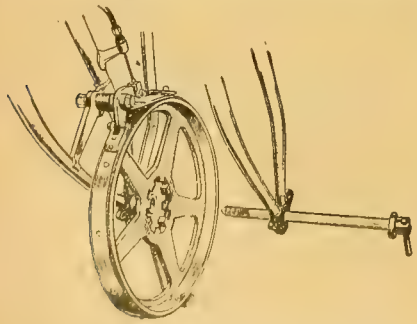
4 h.p. Blackburne; 85×88 mm. (499 c.c.); single-cylinder four-stroke; side-by-side valves; drip feed lubrication; Cox-Atmos or Senspray carburetter; chain-driven Maglita; three-speed Sturmey-Archer gear; chain and belt drive; Dunlop 26×3in. tyres. Price with sidecar £200.

Alfred Wiseman, Ltd., Glover Street, Birmingham.—Very rapid has been the rise of the Verus. A trust in the value and lessons of reliability trials probably accounts for this in no small degree. Anyhow, whatever the cause, the Verus now ranks among the aristocracy of the pastime, and careful examination proves that the position has been well earned. Their "4" sidecar outfit is built entirely on the lines of the more luxurious twins. The mudguarding is cleanly carried out and exceptionally extensive; the rear carrier has evidently been built for an extra passenger, while the front stand, which possesses the unusual refinements of a stop and spring clips, is a typical example of the attention that has been paid to detail. Upon undoing three bolts the whole engine unit may be removed. Particularly noticeable, also, is the aluminium flywheel and primary chain cover, which possesses an inspection door allowing quick access to the clutch.

4 h.p. Blackburne; 85×88 mm. (499 c.c.); single-cylinder four-stroke; side-by-side valves; drip feed lubrication; Senspray carburetter; E.I.C. chain-driven magneto; three-speed Sturmey-Archer gear; chain and belt drive; Avon or Dunlop 26×2¼ tyres. Price £126.

Interesting as one of the few 4 h.p. machines at the Show that may be brought below the 200 lb. taxation limit, this model is, with the exception of the engine, entirely different from the sidecar machine. Footrests, "W.D." bars, a small tank with an aluminium toolbox on top, combine to form a speedy, light and simple go-anywhere machine—with all the attributes of the nominal "lightweight." A 2¾ h.p. Blackburne-engined model differs mainly in the gear box—a two-speed Burman, and sells at £108.

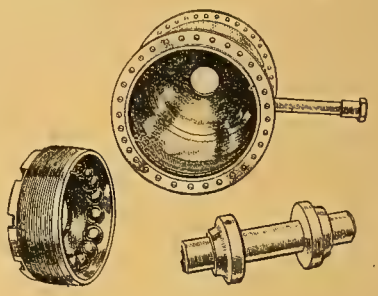
The heavier 2¾ h.p. Blackburne-engined Verus weighs approximately the same as the light "four"—fuller equipment, mudguarding, etc., account for this.



Front wheel removed from the forks to show the new front wheel band brake on the Matchless. When the axle is withdrawn and the wheel slipped out of the forks, the brake band and the brake torque stay retain the brake drum in position. When the front wheel is in position the brake drum is locked by serrations to the wheel hub.

2½ h.p.; 70×70 mm. (269 c.c.); single-cylinder two-stroke; drip feed lubrication; Amac or Senspray carburetter; Runbaken chain-driven magneto; two-speed Sturmey-Archer gear; chain and belt drive; Hutchinson 26× 2¼in. tyres. Price £85.

A pair of two-strokes—one engined as above, and the other with a 211 c.c. power unit and direct belt drive, selling at £60—complete the Verus exhibit. The engines in these cases, manufactured by the company, have a very thorough lubricating system. Oil is led to the cylinder wall, runs through a hollow gudgeon pin and finds its way to the big end, a separate lead supplying the crankshaft bearings.



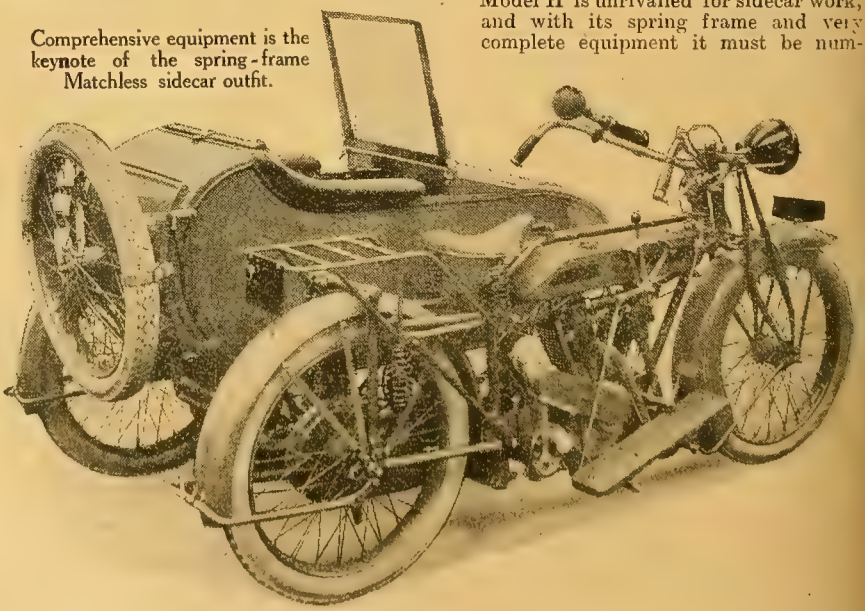
The components of the very large hubs fitted to the wheels of the new Matchless. The balls in the races are now of half-inch diameter.

MATCHLESS. (68.)

8 h.p. M.A.G.; 82×94 mm. (992 c.c.); twin-cylinder four-stroke; overhead inlet valves; drip feed lubrication; B. and B. carburetter; chain-driven Magdyno; three-speed sliding gear; chain drive; spring frame; 28×3in. tyres. Price with sidecar £231 12s. 6d.

H. Collier and Sons, Ltd., 44, Plumstead Road, Plumstead, S.E.—With a reputation second to none, the Matchless Model H is unrivalled for sidecar work, and with its spring frame and very complete equipment it must be num-

Comprehensive equipment is the keynote of the spring-frame Matchless sidecar outfit.

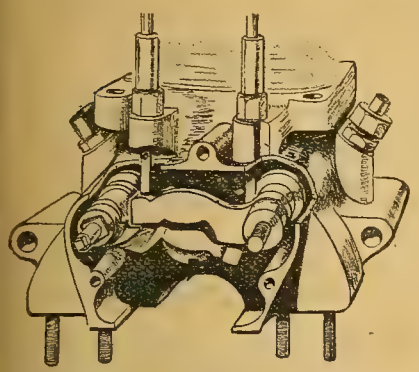


The Olympia Show.—
bered amongst the luxurious sidecar machines. Detachable and interchangeable wheels are provided, and it may be obtained with either the M.A.G. or J.A.P. engine. For the spring frame coil springs are retained, and all joints are provided with oil caps of large size, so that wear in these important bearings should be reduced to a minimum. A sectioned gear box is exhibited, from which the action and operation of the gears may readily be seen, and the operation of the clutch and the combined exhaust lifter and kick starter may also be observed. As regards the two power units, little need be said. Six models are available for inspection, and it will be noticed that the machine may be had with electrical equipment or without, as desired. The new hand front wheel contracting brake is deserving of inspection, and should prove very effective in use.

BEARDMORE-PRECISION (115.)

3 h.p.; 71×84 mm. (350 c.c.); single-cylinder two-stroke; mechanical lubrication; Zenith carburetter; chain-driven magneto; two-speed selective clutch gear; all-chain drive; spring frame; Dunlop 26in.×2¼in. tyres. Price £105 solo; £140 combination.

F. E. Baker, Ltd., King's Norton.—Great interest was aroused at last year's



Valve-operating mechanism of the Whippet Scooter showing new exhaust valve lifter.

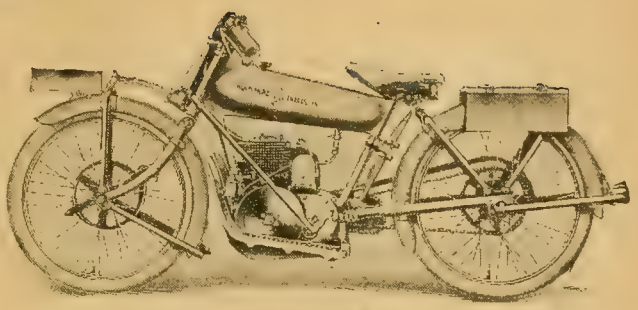
Show in the first models of this machine, and the latest type shown this year is no less noteworthy. In internal design of the engine itself, certain alterations have been made, especially in the shape of the exhaust port and the piston deflection. These improvements, together with slight modifications in the oiling system, have materially increased the power output of the engine, with no increase in the petrol consumption. As a consequence of this, a sidecar outfit is now being offered, with a sidecar specially designed to retain the full advantages of the excellent leaf spring frame on the cycle itself. Generally, the machine attracts much attention by its extreme neatness. The roller brake and release levers, the triple Bowden lever for all engine controls (with the wires neatly encased), and the large handle-bar two-speed lever, continue to produce an exceptionally easy control. As was the case last year, the machine is built of steel throughout, and the steel tank is built integral with the frame. The Beardmore-Precision engine, with its combined selective clutch two-speed gear, is one of the few examples of unit construction to be seen at Olympia. The springing system provides a remarkably large motion, thus ensuring comfort, and the practically minded should not miss the extremely neat tool case in which a space is provided for each unit of the kit. It will be remembered that the mudguards are especially constructed, and act as frame members.

One of the most efficient little engines rests behind the "cage" on the Whippet Miniature.

WHIPPET MINIATURE MOTOR CYCLE. (26a.)

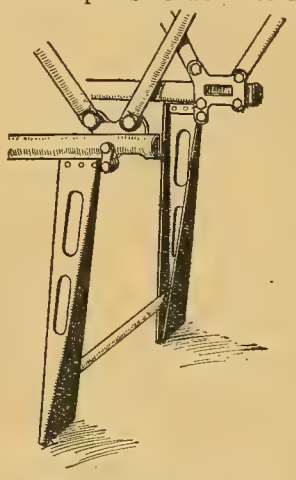
1½ h.p.; 56×61 mm. (150 c.c.); single-cylinder four-stroke; overhead valves; drip feed lubrication; Vici single-lever carburetter; C.A.V. chain-driven magneto; single-speed gear; chain drive; Wood-Milne 18×2in. tyres. Price £58 10s.

W. G. Hayward and Co., Ltd., Twickenham.—Three distinct models are shown on this stand, which differ only in minor details. In every case the motive power is the same; the interesting little Whippet engine is fitted with an aluminium cylinder and a steel liner. The cylinder head is of cast iron, and the valves of the overhead pattern. The Whippet has emerged from the scooter into a miniature motor bicycle, and is now fitted with 18in. wheels. It is thoroughly up-to-date and has a scientifically designed single-lever carburetter. Of the three models exhibited the *de luxe* model has naturally all the latest refinements, including a dressguard, in case the machine should be ridden by a lady, an XL'All saddle, electric lighting, and a luggage carrier. The Sports model has also electric lighting, a racing saddle, and wider handle-bars. The standard model,



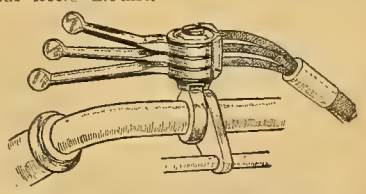
Externally, a lower riding position and extended footboards are Beardmore improvements for 1921.

which is two guineas cheaper, is provided with oil lamps, a simple type of saddle, and narrower handle-bars. No carrier is fitted. The prices of all three models



Pressed-steel construction combines lightness with strength on the Beardmore rear stand.

include a year's free insurance, and the registration fees. Messrs. W. G. Hayward, Ltd., have certainly studied the question of the miniature motor bicycle, and have turned out a thoroughly practical little mount.



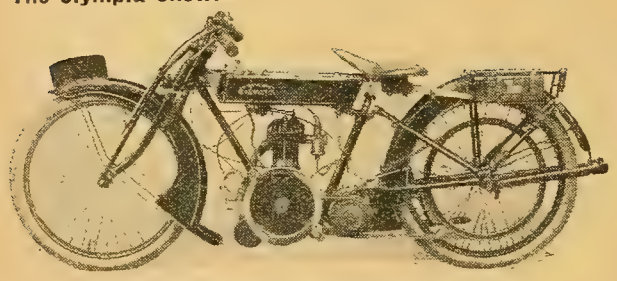
Ignition and the two-lever carburetter are controlled from the same handle-bar mounting on the Beardmore-Precision.

EDMUND. (145.)

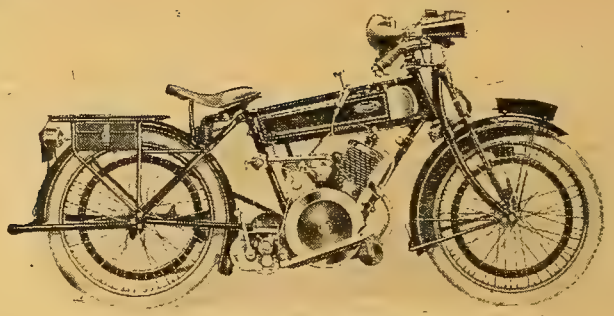
2¾ h.p. Blackburne; 71×88 mm. (349 c.c.); single-cylinder four-stroke; side-by-side valves; drip feed lubrication; Amac carburetter; E.I.C. chain-driven magneto; two-speed Burman gear; chain and belt drive; Dunlop 26×2¼in. tyres. Price £105.

C. Edmund and Co. (1920), Ltd., Crane Bank, Chester.—Both front and rear springing on the Edmund is now

The Olympia Show.—



Rear frame suspension that has stood the test of time is again embodied in the Edmund-Blackburne.



By reason of its simplicity the Dunelt big single two-stroke sells at a very moderate figure.

very advanced for a lightweight machine. The rear system of springing is no new untried device; but, for the benefit of those who are newcomers to the pastime, we will recapitulate. Briefly, the top tube, to which is attached the petrol tank, is pivoted at its forward end. Linked to the rear end is the saddle tube, which slides in the outer rear main tube in phosphor bronze bushes, and to which, at its lower end, are fixed the footrests. This movement is controlled by two stiff leaf springs attached to special rear carrier stays. With these stays are incorporated two auxiliary coil springs which are instantly adjustable in tension. Thus, in effect, only the rider and the tank are insulated, and, therefore, belt tension does not vary. The front forks utilise parallel motion links of the usual type, but the spring is a vertical laminated one. The friction generated by this spring against the upper shackle pin effectively damps all rebound.

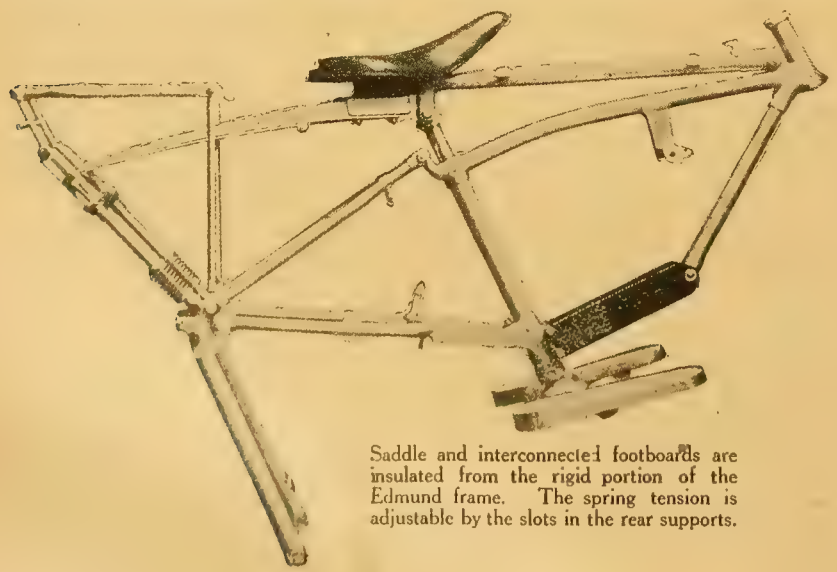
2¾ h.p. J.A.P.; 70×76 mm. (292 c.c.); single-cylinder four-stroke; side-by-side valves; drip feed lubrication; Amac carburetter; B.T.H. chain-driven magneto; two-speed Burman gear; chain and belt drive; Dunlop 26×2¼in. tyres. Price £95.

This model is also fitted with the Edmund patent type of rear springing, but, pending the substitution of the new fork at a later date, Druid forks are used. It is also shown as an all-chain drive sporting model with Enfield two-speed.

DUNELT. (138.)

4½ h.p.; 85×88 mm. (499 c.c.); single-cylinder two-stroke; drip feed lubrication; Cox Atmos carburetter; M-L chain-driven magneto; three-speed Sturmey-Archer gear; chain and belt drive; Hutchinson 26in. ×2½in. tyres. Price £115, with sidecar and spare wheel £150.

Dunford and Elliot (Sheffield). Ltd., 96, Bath Street, Birmingham.—It is satisfying to note that the Dunelt is making good, striking out as it does on new and hitherto untried lines, and yet with a definite reason for its divorce from Dame Convention. To combine power for sidecar work with a low initial cost is the *raison d'être* of this machine, and we think that the makers have achieved their aim. Cooling, or perhaps more correctly overheating, the inherent bugbear of the big two-stroke engine as a type, has been overcome by using a two diameter piston, allowing a 50% greater charge than is ordinarily possible, and providing a flow of air round the piston trunk. Numerous little details have been improved since last year. The compression release valve now has a flexible tubing connection to the main exhaust pipe. The adoption of split roller-bearing big ends is the only internal modification of importance. Two thumbscrews allow the primary chain cover to be quickly detached, while all hubs have knock-out spindles. The cylinder, it will be remembered, lies almost diagonally in the frame, which certainly keeps the large, somewhat bare, outline from obtruding in the super æsthetic eye. The machine immediately impresses one as sound and sturdy, yet compact and symmetrical. Evidently the lessons of the last Six Days Trials—where the Dunelt gained two "golds"—have not been lost on the designers.

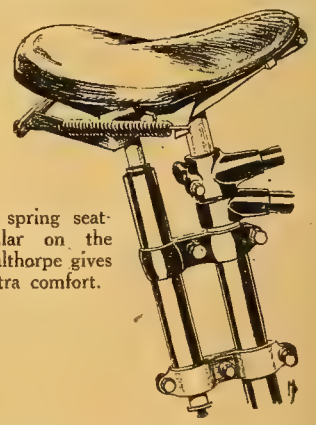


Saddle and interconnected footboards are insulated from the rigid portion of the Edmund frame. The spring tension is adjustable by the slots in the rear supports.

CALTHORPE. (112.)

3 h.p.; 75×79 mm. (350 c.c.); single-cylinder two-stroke; drip feed lubrication; B. and B. carburetter; Sturmey-Archer gear; chain-driven magneto; chain and belt drive; Dunlop 26×2¼in. tyres. Price £115 10s., with sidecar and lighting set.

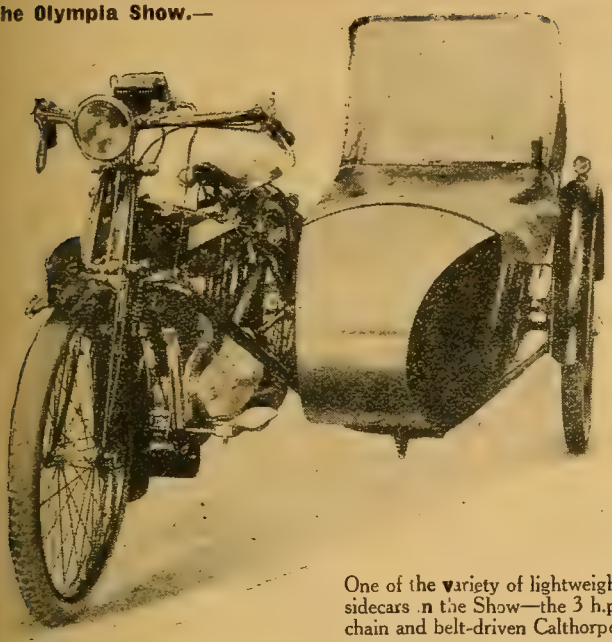
Calthorpe Motor Cycle Co., 16, Barn Street, Birmingham.—One of the most interesting of the new lightweight



A spring seat-pillar on the Calthorpe gives extra comfort.

sidecar machines is the 3 h.p. two-stroke Calthorpe. This model, which is fitted with the Calthorpe 350 c.c. engine, is noteworthy as being a very complete outfit at an extremely moderate price. It is capable of averaging well over 20 m.p.h. on give-and-take roads with a passenger, and will reach a maximum of nearly double this figure. It is to be observed that in an effort to prevent the ruthless overloading to which so many lightweight machines are subject, the makers have built the rear mudguard without any form of carrier. A Maglita set is fitted, but if it is desired to dispense with electric lighting, an allowance of ten guineas is made. Generally, the outfit has a thoroughly workmanlike appearance. For solo use, the machine is fitted with the Enfield two-speed gear instead of the Sturmey-Archer, and it has lighter tyres. Otherwise the specification is

The Olympia Show.—



One of the variety of lightweight sidecars in the Show—the 3 h.p. chain and belt-driven Calthorpe.

similar. The price of the solo machine is £68 5s.

2¾ h.p.; 70×76 mm. (292 c.c.); single-cylinder four-stroke; side-by-side valves; drip feed lubrication; Amac carburetter; chain-driven magneto; Enfield two-speed selective clutch gear; chain and belt drive; Dunlop 26 × 2in. tyres. Price £73 10s.

This machine, which embodies the well-known 2¾ h.p. J.A.P. engine, remains practically as it was last year, and should appeal especially to those who have not yet overcome a feeling of uncertainty as regards two-strokes.

The Calthorpe models generally appear especially clean and neat—a point which even now does not receive the attention it should in all makes.

ALLON. (62.)

2½ h.p.; 70×76 mm. (292 c.c.); single-cylinder two-stroke; drip-feed lubrication; Senspray carburetter; Fellows chain-driven magneto; three-speed Allon gear; chain and belt drive; 26in.×2¼in. tyres.

ALLDAYS AND ONIONS, LTD., Matchless Works, Birmingham.—The Allon is here shown for the first time with a three-speed gear box of the firm's own manufacture, the change making the machine more suitable for sidecar work. Accordingly a complete outfit is exhibited and is a small but practical vehicle not too elaborate, yet with all the fittings that the average rider would desire. The engine is quite a normal type two-stroke also made by the firm, and transmission is by chain and belt. Two models are offered—the engine in each case having the cylinder cast integral with the top of the crank case, one having a two-speed gear box of the type used successfully during the present year.

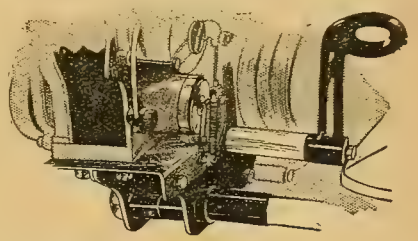
A characteristic feature of the design is the twin tank which bridges the top tube and contains both petrol and oil, the latter in one section of the right-hand tank. To connect together the two petrol reservoirs a bridge pipe of U shape is carried under the tanks.

This is one of the few machines which have a small contracting band brake on both front and rear wheels, the brake surface provided being ample in each case. As regards detail work, leg guards are standard and should be convenient; advantage being taken of the upright shields to carry the tyre pump in clips secured to one of them. Again, the new fork with its leaf spring almost entirely concealed is worth a close inspection as, externally, it is one of the neatest in the Exhibition, and certainly it is easy to clean. Lastly, there is a small but effective belt guard over a portion of the belt rim, and in just the position to catch mud which otherwise would bespatter the belt.

ROYAL RUBY. (125.)

8 h.p.; 85.5×85 mm. (976 c.c.); twin-cylinder four-stroke; side-by-side valves; drip-feed lubrication; Amac or B. and B. carburetter; chain-driven magneto; three-speed Sturmey-Archer gear; all-chain drive; Dunlop 28×3in. tyres. Price £235.

RUBY CYCLE CO., LTD., Royal Ruby Works, Altrincham.—Notable for its excellent system of springing, employing laminated leaves for both front and rear wheels, both the 3 h.p. and 5 h.p. Royal Ruby are again attracting the attention of prospective buyers. A very fine sidecar outfit is the leading feature of the stand, and employs an 8 h.p. J.A.P. engine. Notable points in the construction of the machine are the locking plates on the spring fork shackles. These enable the shackle bolts to have dome-ended nuts on them, thus preventing the ends of the bolts from getting rusty. A strengthened front down tube, which consists of a main central tube with a single tube of smaller section on each side of it, is another distinctive feature, while another good point is the well-designed spring housing below the saddle, and the double down tubes from it; one goes to the rear engine plate and the other to the front end of the chain stays, immediately behind the gear box.

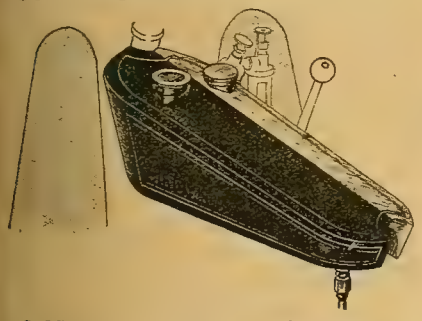


The front sidecar connecting bolt of the Royal Ruby passes through the engine bearer plates, and thus clamps them together.

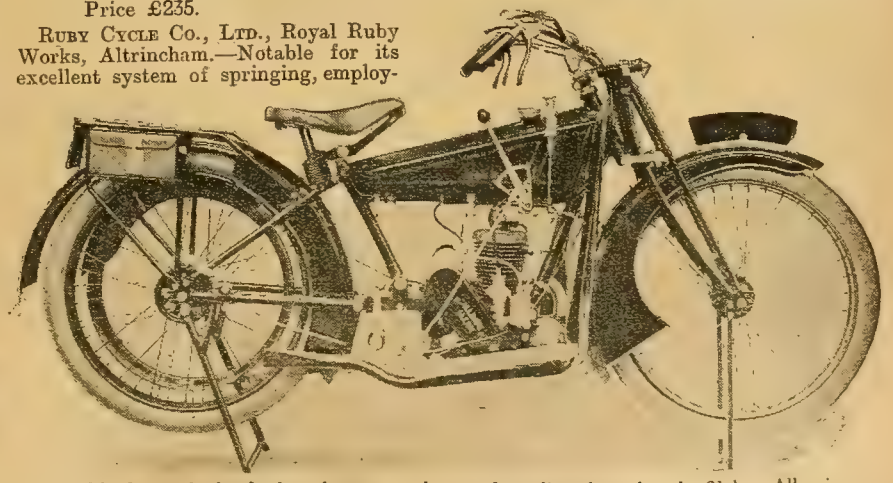
The back stays also are double, and, in fact, the whole frame gives a fine impression of strength without excessive weight. The springing system is adjustable to the weight of the rider, and the sidecar is beautifully sprung.

2¾ h.p.; 74½×80 mm. (349 c.c.); single-cylinder four-stroke; side-by-side valves; drip-feed lubrication; Amac or B. and B. carburetter; chain-driven magneto; two-speed Royal Ruby gear; chain and belt drive; Dunlop 26×2¼in. tyres. Price £89 5s.

The small four-stroke machine, which has been introduced as a sporting solo mount, is designed on similar lines to



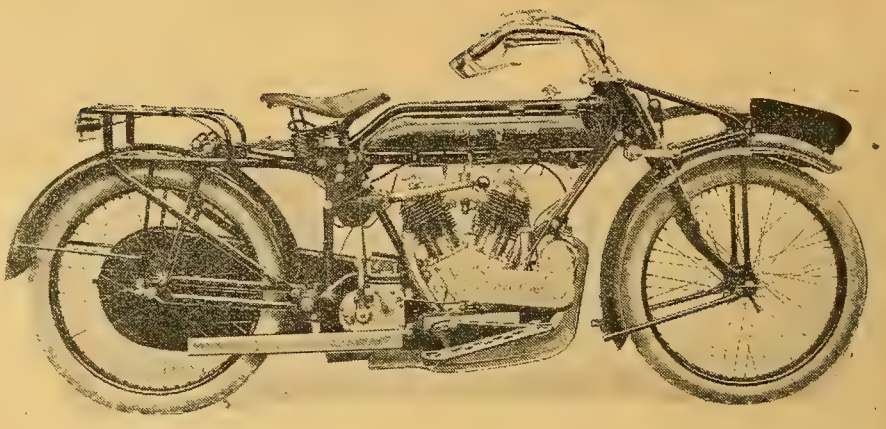
Saddle type tank of Alldays-Allon, also showing the height to which the leg guards extend.



Band brakes on both wheels and very complete mudguarding show that the 2½ h.p. Allon is the product of the engineer who is a practical motor cyclist.

The Olympia Show.—

the sidecar outfit as far as the front part of the frame is concerned, but the spring frame is not embodied in it. The engine appears to conform to all the standards of modern design, and the gear box, which is also made by the firm, is a very good example of the sliding gear type. The weight of the machine is well under the 200 lb. limit, so that the tax will be only 30s. An alternative model provided with the spring frame is also made; this will have a new engine of slightly larger capacity, and will be sold at £120.

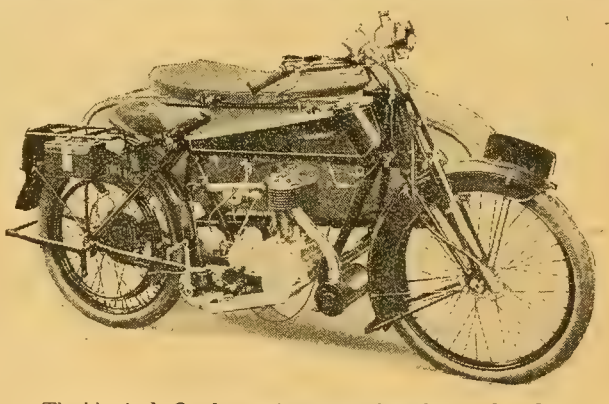


The spring frame 8 h.p. Royal Ruby-Jap. Fitted with a three-speed gear and enclosed chain drive, this mount is specially suited for passenger work.

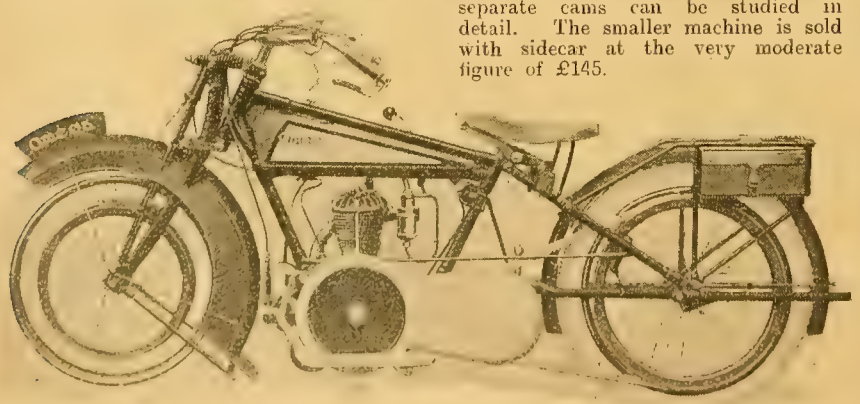
QUADRANT. (41.)

6 h.p.; 87×110 mm. (653 c.c.); single-cylinder four-stroke; side-by-side valves; hand pump lubrication; Amac or Senspray carburetter; gear-driven magneto; three-speed Sturmey-Archer gear; chain drive; 26×2½in. tyres. Price with sidecar £155.

MARCH NEWARK AND CO., LTD., Lawley Street, Birmingham.—The Quadrant is a serviceable and steady mount, suitable for everyday hard work without needing undue care or attention. The principal model is the new 6 h.p., chiefly notable for a very wide and substantial crank case, which is kept smooth on the exterior, and, therefore, is exceptionally easy to clean. This idea has been consistently carried out, in that the number of plated parts on the motor cycle is reduced to a minimum. The riding position, and shape and length of handle-bar are good, and the sidecar chassis appears to be quite substantial enough to stand the exceptionally rough usage which this type of machine is usually accorded. Mechanically, the design differs from the ordinary in that the two valve ports are entirely separate, the inlet valve being behind the cylinder and the exhaust at the side, in a position where it obtains the maximum cooling draught. By this arrangement the valve springs, valve stems, and cotters become quite accessible, and can be cleaned or adjusted without trouble. A second model of 4½ h.p., also a single-cylinder, is shown on the stand, and is designed chiefly for dual-purpose work. To add to the interest, a sectional engine of this type is shown, and prospective customers can see for themselves every part of the mechanism, including the crank case, timing gear, and valve operation, while, as this engine is of the same design as the 6 h.p., the method of actuating the two valves by separate cams can be studied in detail. The smaller machine is sold with sidecar at the very moderate figure of £145.



The big single Quadrant sidecar, a moderately priced outfit.



Well known as a light J.A.P.-engined machine, the Omega has developed into larger sizes. The 4 h.p. Blackburne-engined model illustrated has a low riding position and excellent mudguarding.

OMEGA. (27.)

5-6 h.p. J.A.P.; 70×85 mm. (654 c.c.); twin-cylinder four-stroke; side-by-side valves; drip feed lubrication; Amac carburetter; B.T.H. chain-driven magneto; three-speed Sturmey-Archer gear; chain and belt drive; Dunlop 26×3in. tyres. Price £135.

W. J. GREEN, LTD., Omega Works, Coventry.—This is a handsome machine primarily intended for sidecar use and fitted with the latest pattern 5-6 h.p. J.A.P. engine. Among its principal features are a concealed top tube, rendering the tank easy to clean, excellent mudguarding, a large silencer with tail pipe underneath the gear box, comfortable footboards, and generally substantial construction. A similar machine having the 4 h.p. Blackburne engine, and selling at £120, is an alternative model. It is a handy double-purpose mount, which is ideal for solo riding, and yet possesses ample reserve for sidecar work.

2¾ h.p. J.A.P.; 70×76 mm. (293 c.c.); single-cylinder four-stroke; side-by-side valves; drip feed lubrication; B. and B. carburetter; C.A.V. chain-driven magneto; two-speed Sturmey-Archer or Albion gear; chain and belt drive; Dunlop 26×2¼in. tyres. Price £83, with two-speed gear box and kick starter.

There are three 2¾ h.p. J.A.P.-engined models, which are practically the same in every detail except as regards the gear box, one of these being fitted with a Sturmey-Archer lightweight two-speed gear, and another with Albion two-speed without kick starter. One of the Omega two-strokes is shown as a sidecar outfit, and a very practical little outfit at that. It is thoroughly well finished, and is engined with a Villiers two-stroke power unit, and sells at £90 complete. The Gosport forks are a feature of these models. The last model to be mentioned is one similar to the aforementioned as regards the engine, but it is provided with a single-speed gear, Brampton forks, and is sold to the public at £50. The attention attracted by such simple and low-priced machines as this Omega forms quite one of the features of the Show, and the demand should be proportionate.

Don't Miss It!

An Interesting Feature of the SHOW, but OUTSIDE OLYMPIA

All our New Models are being exhibited

DURING SHOW WEEK

at

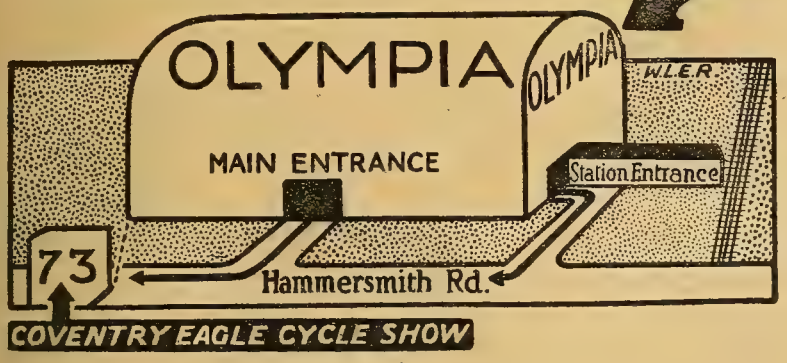
73, Hammersmith Road

(almost opposite Main Entrance—see Diagram), in premises specially taken for the purpose.

Cross the Road

and see these before you leave.

Fix this spot in your mind ; its well worth visiting.



Many features on these Models are worthy of close and careful examination.

They occupy one of the foremost positions as to grade, being widely recognised as Standard A1 in Design, Workmanship and Equipment.

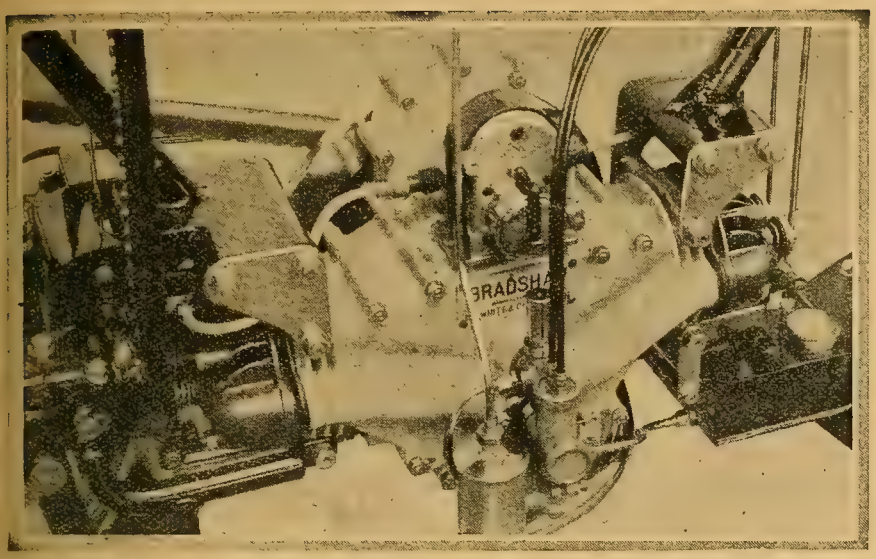
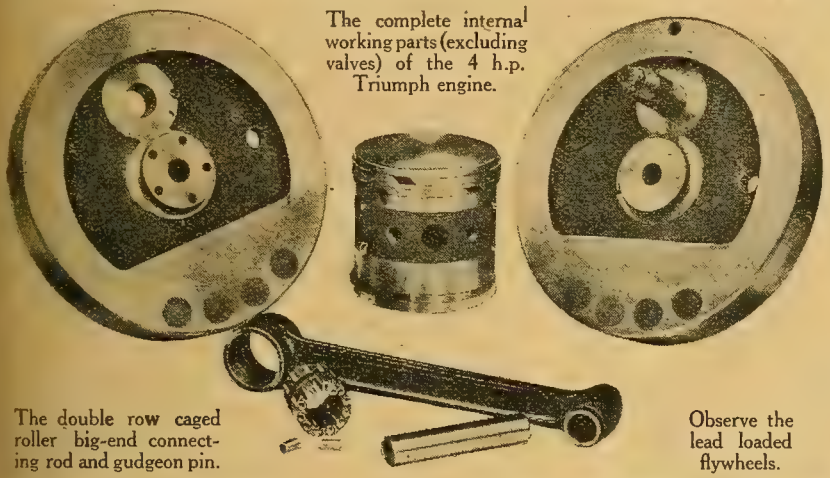
SOME DETAILS OF 1921 ENGINES.



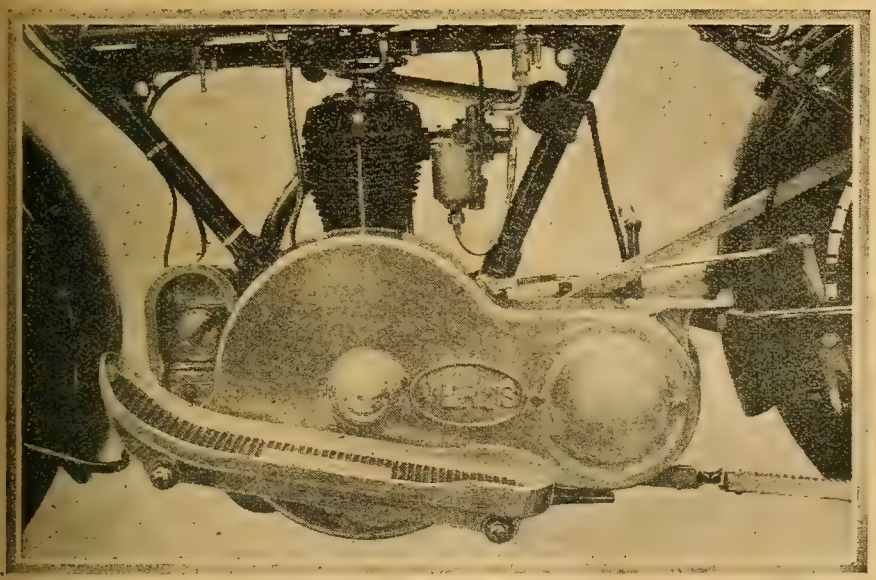
A novel engine is the 3½ h.p. Bradshaw which has all but its cylinder heads buried in the crank case.



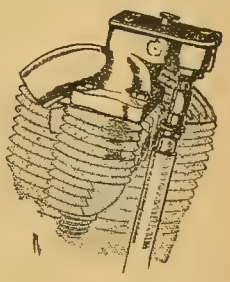
The complete internal working parts (excluding valves) of the 4 h.p. Triumph engine.

The double row caged roller big-end connecting rod and gudgeon pin.

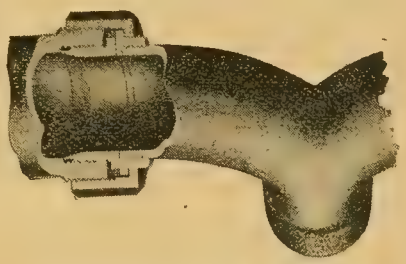
Observe the lead loaded flywheels.



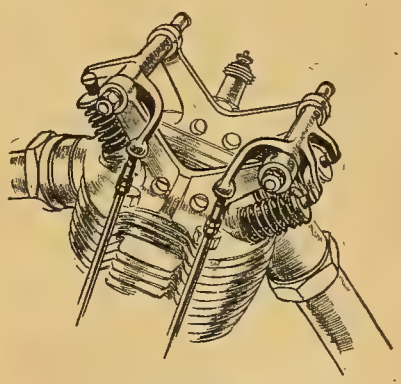
On the Verus sidecar machine, the outside flywheel is enclosed in a handsome aluminium cover.



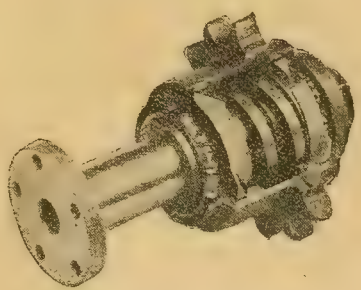
Shown open here, this telescopic sheath protects the inlet valve operating rod on the M.A.G. engine.



A smooth passage for the gas, combined with an airtight joint, is ensured by this method of fixing the 6 h.p. B.S.A. induction pipe.



A cylinder head of the N.U.T. "six valve" sporting model.



Part sectional view of the shock-absorber fitted to the engine shaft of the 4 h.p. Triumph.

The Olympia Show.—

ARMIS. (22.)

5 h.p.; 70×85 mm. (654 c.c.); two-cylinder four-stroke; side-by-side valves; drip feed lubrication; Cox Atmos single-lever carburetter; T.B. chain-driven magneto; three-speed Burman gear; chain and belt drive; Dunlop 26×2¼in. tyres. Price with sidecar, £165; solo, £135.

Armis Cycle Co., Heneage Street, Birmingham.—This is an attractive sidecar outfit of reasonable weight, fitted with the latest 5 h.p. J.A.P. engine. It is driven by a substantial chain, which is adequately protected through a Burman three-speed gear box incorporating a clutch and kick starter. The final drive is by belt. One of the most practical things on the machine is the method of sliding the gear box, to accomplish which the four holding-on bolts are loosened, when the tightening of the adjusting nut has the effect of drawing the gear box to the rear and at the same time preserving the alignment. The mudguarding has also been well studied, and spacious aluminium footboards are provided. There is also an ample sized cover over the magneto. So far as the frame is concerned, this is of strong construction, and the top tube is sloped towards the rear, thus affording the driver a low riding position. A new and efficient Bowden rim brake is fitted to the front wheel. Weight of the machine without sidecar is 250 lb.

3½ h.p.; 74×86 mm. (350 c.c.); single-cylinder two-stroke; mechanical lubrication; Amac carburetter; M-L magneto; two-speed Burman countershaft gear; chain and belt drive; Dunlop 26×2¼in. tyres. Price solo, £85; sidecar, £115.

This is also shown as a sidecar outfit; its power unit is a Precision two-stroke, fitted with mechanical lubrication and detachable head, while a Maglita set supplies current for both ignition and lamps. It should be ideal for the man of moderate means, who requires a machine which can be used satisfactorily for both business and pleasure. Both frame and tank follow the lines of the model described above. This outfit is fitted with a Flexa spring seat-pillar, which carries the saddle on a laminated spring. The saddle is the well-known XL'All. Both models are fitted with celluloid-covered handle-bars, so that the owner of an Armis need not worry about too much plated work to clean. The weight is 180 lb. solo.

2¾ h.p.; 70×76 mm. (293 c.c.); four-stroke; pump and drip feed lubrication; Amac carburetter; Lion magneto; two-speed Burman gear; chain and belt drive; Palmer 26×2¼in. tyres. Price £85.

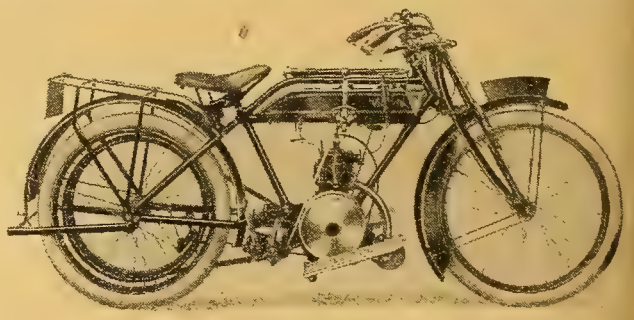
This handy 2¾ h.p. J.A.P.-engined lightweight, like other Armis models, is well mudguarded, is provided with footboards, and wide semi-T.T. handlebars, which are celluloid-covered. It is also fitted similarly to the other models with XL'All saddle and Saxon forks.

Lateral play is entirely absent in the Flexa spring seat-pillar, now a standard fitment on the Armis lightweight.

VICTORIA. (127.)

4 h.p. J.A.P.; 85.5×85 mm. (488 c.c.); single-cylinder four-stroke; side-by-side valves; drip feed lubrication; Amac carburetter; Splitdorf chain-driven magneto; three-speed Sturmey-Archer gear; chain and belt drive; Dunlop 26×2½in. tyres. Price with sidecar £125.

Victoria Works, Dennistoun, Glasgow.—Stands Scotland where she did? However, the absence of quantity is more than balanced by the quality and remarkable value of the only exhibit from across the Border. Most striking is the value of the sidecar outfit offered, as specified above, at the figure of £125 inclusive. For the family man who does not possess an ultra deep pocket, we can imagine no more suitable purchase. Throughout, this machine is a sound, honest, and straightforward effort to provide economical motoring for two—but the specification speaks for itself.

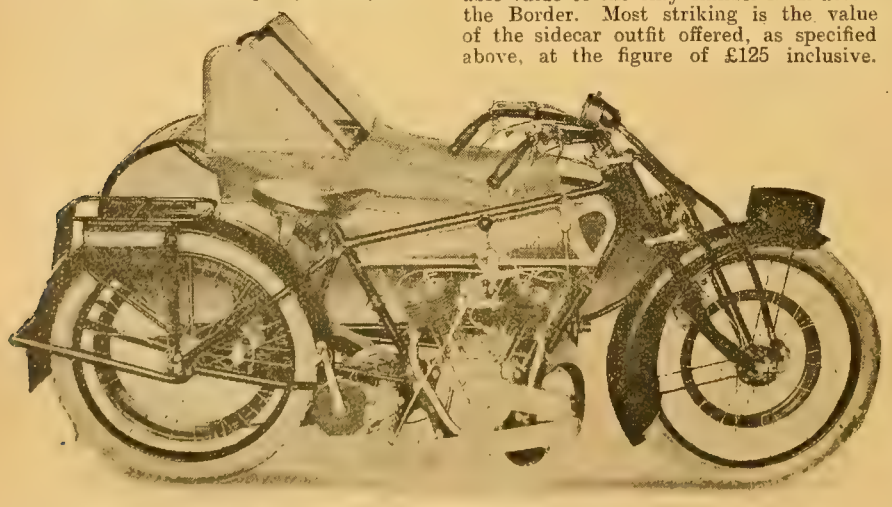


Scotland's only representative at Olympia—the lightweight Victoria model.

5-7 h.p.; 75×78 mm. (688 c.c.); flat twin-cylinder four-stroke; side-by-side valves; drip feed lubrication; B. and B. carburetter; gear-driven magneto; three-speed Sturmey gear; chain and belt drive; Dunlop 650×65 mm. tyres. Price with sidecar £170.

For those who prefer something more luxurious than a single-cylinder the 5-7 Coventry Victor engined machine should appeal—also at a competitive price. This model was shown last year for the first time, and remains entirely unaltered. A duplex frame allows of a very neat and easily detachable mounting for the power unit, while a low riding position and well-positioned footboards help towards comfort for the driver. In order to provide a larger clearance and easier running on colonial tracks, the Overseas model is fitted with 28×3in. tyres. In both clearance and extent the mudguarding is excellent. Silencing is carried out by a large streamlined silencer with a short extension pipe to the rear.

Of sturdier build and appearance than the average low-priced lightweight, the 2½ h.p. Victoria Villiers is nevertheless well under the 200 lb. taxation limit. A single-speed model sells at £55, a two-speed at £60, and a clutch and kick-starter model at £65.



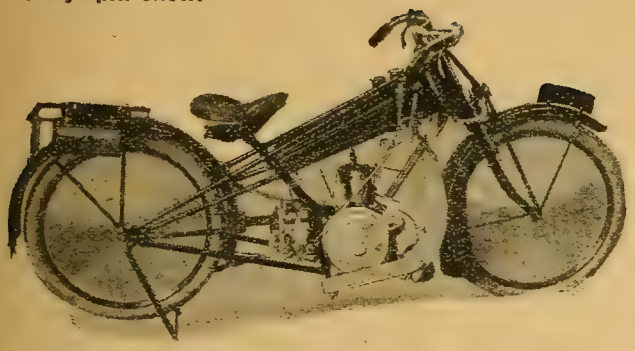
5-6 h.p. Armis-Jap three-speed sidecar outfit.

COTTON. (165.)

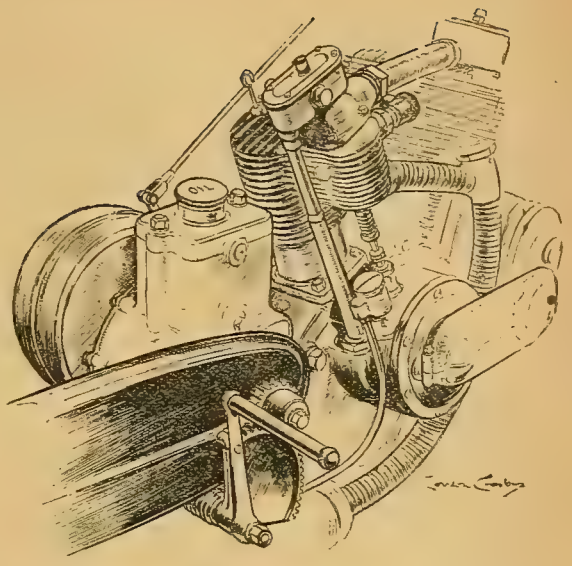
2½ h.p. Villiers; 70×70 mm. (269 c.c.); single-cylinder two-stroke; drip feed lubrication; Amac carburetter; flywheel magneto; two-speed Albion gear; chain and belt drive; Dunlop 26×2¼in. tyres. Price £71 8s.

The Cotton Motor Co., Bristol Road, Gloucester.—Triangulated frame construction has been for years the text of the theorist, but in practice pedal cycle ideas and fashions remain very much with us. Eminently satisfactory as the conventional frame proves, it should not be regarded for this reason as *le dernier cri;* and an advanced design, such as the Cotton, which breaks away entirely from convention, deserves every encouragement, for in that direction progress lies. Rigidity combines with lightness in the Cotton duplex triangulated frame, while a long, straight sweep from steering head

The Olympia Show.—



Straight duplex tubes are used in the construction of the Cotton-Villiers.



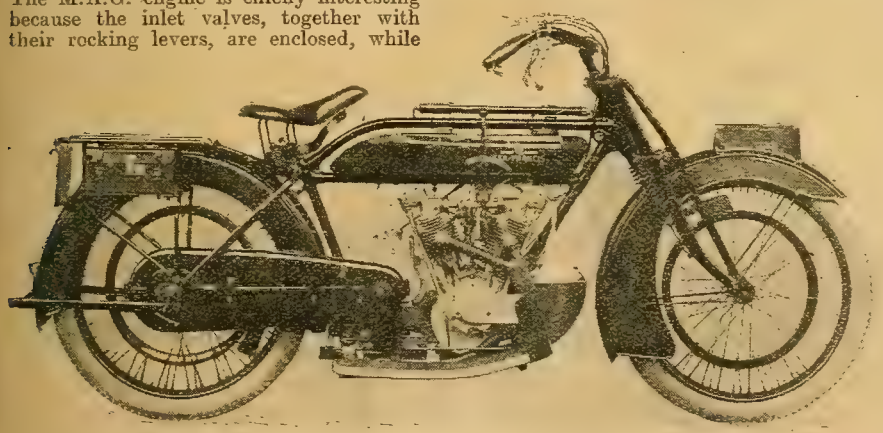
Valve side of new 5 h.p. Lea-Francis power unit, showing the new three-speed gear box with enclosed selector mechanism.

to rear axle permits the rider's centre of gravity to lie well forward and low. As a consequence, it should give a sense of security and a very tangible absence of "skid" on grease. In this case an unconventional appearance does not mean a displeasing appearance. In fact, there is something extremely taking about the lines of the Cotton. It is worthy of note that the makers recommend disc wheels. Owing to its construction the machine is particularly suited for the lady motor cyclist, for whom it may be fitted with a kick-starter and dressguards. Wider mudguards and a larger tank are 1921 improvements, but otherwise the design is basically unaltered.

LEA-FRANCIS. (58.)

5 h.p.; 64×92 mm. (592 c.c.); twin-cylinder four-stroke; overhead inlet valves; hand pump lubrication; Amac carburetter; Lucas chain-driven Magdyno; three-speed constant mesh type gear; chain drive; 26×2½in. tyres.

LEA AND FRANCIS, LTD., Lower Ford Street, Coventry.—The Lea-Francis needs no introduction; for many years it has been regarded by many as one of the highest class machines on the road, albeit one of the most silent. Even at a first glance the machine looks most serviceable and workmanlike—in fact, it in many ways reminds one of car practice, so thoroughly has the detail been studied. The M.A.G. engine is chiefly interesting because the inlet valves, together with their rocking levers, are enclosed, while the exhaust valves have their stems and springs exposed. From the exhaust ports gas is led through flexible pipes to a very substantial silencer rigidly bolted below the frame, and of considerable size. On the 5 h.p. machines power for electric light is supplied by a Magdyno placed in front of the engine, and efficiently guarded from mud by a curiously shaped coverplate, which also acts as an additional protection for the rider's feet. The 3½ h.p. machines are not provided with this fitting, but the magneto is placed behind the engine. As an example of the detail work, it may be mentioned that the high-tension wires are carried through in steel tubes on their way to the plugs. The dry plate clutch of the 5 h.p. model is on the crankshaft and in a substantial aluminium case, which encloses also the chain drive to the countershaft, and an inspection cover, very similar to the one on the contact-maker of the magneto, allows the tension of the chain to be judged. On both models the gear box is of very robust proportions, and the oil filler on the 5 h.p. three-speed model is of exceptional size. On the 3½ h.p. 64×77 mm. model, the clutch is on the countershaft, and the gear box is housed in a circular lug which forms the bottom bracket, but in the new 5 h.p. machine an aluminium box is mounted on extensions of the engine cradles.

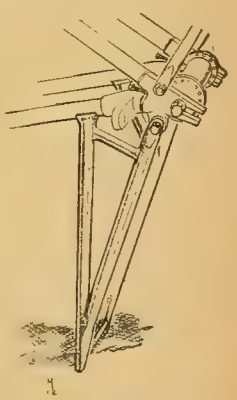


Plated parts have been avoided and every other consideration shown for the all-weather rider on the new 5 h.p. Lea-Francis.

MARTINSYDE. (141a.)

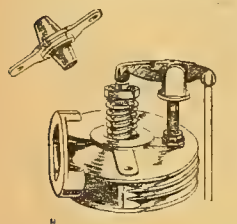
6 h.p.; 70×88 mm. (680 c.c.); V twin four-stroke; overhead exhaust valves; drip feed lubrication; Amac carburetter; M-L chain-driven magneto; three-speed A.J.S. pattern gear; enclosed chain drive; Dunlop 650×65 mm. tyres. Price with sidecar £175.

MARTINSYDE, LTD., Maybury Hill, Woking.—Two sidecar taxis and a light delivery outfit (with an interchangeable "pleasure" body, by the way) will not obscure the public eye to the excellent value offered on this stand in both the standard and *de luxe* sidecar outfits. Of equal interest is the fact that a maximum price has been fixed for the ensuing year. Now celebrating its first birthday, the 6 h.p. Martinsyde has, as was expected, made a distinct hit. Slight modifications ensuring a smoother passage for the gas have been carried out around the overhead exhaust pockets, and improved cooling has been arranged. The inlet valves remain of the more usual "side-by-side" type, but aeroplane engine influence is discernible in the split ring method of holding the gudgeon pin. By slightly in-



Triangulation enters largely into the design of the Martinsyde rear wheel stand.

The Olympia Show.—



Overhead exhaust valves on the Martinsyde permit this ingenious detachable valve guide to be used.

creasing the diameter and width of the rear band brake drum, the retarding effect has been considerably increased. Totally enclosed chain drive takes the power from a gear box of A.J.S. pattern to the rear wheel. Equal to anything at the Show in the completeness (Lucas Magdyno, interchangeable wheels, etc.) of its equipment, if not in price, the *de luxe* model should appeal to the most fastidious.

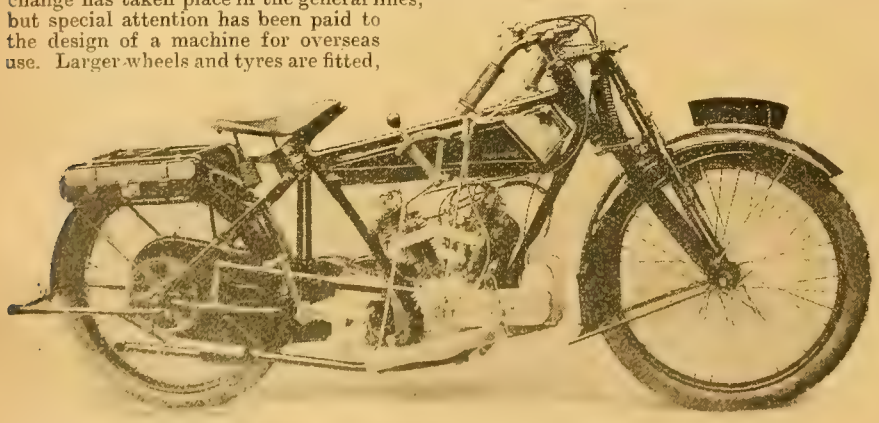
3½ h.p.; 60×88 mm. (497 c.c.); V twin four-stroke; overhead exhaust valves; drip feed lubrication; Amac carburetter; M-L chain-driven magneto; three-speed A.J.S. pattern gear; chain drive; Dunlop 26×2½in. tyres. Price £135.

Making its *début* at this Show, the 3½ h.p. solo mount has evidently been built with one eye on efficiency and the other on speed. Much of the engine is common to the larger model, and in appearance and design it is identical. A gear box of the same type is used, although the frame, of course, is lighter and shorter. Worthy of special attention, both here and on the "six," is a quickly detachable aluminium cover completely enclosing the magneto. Careful provision has been made to ensure that both cylinders receive an equal share of attention from the oil tank.

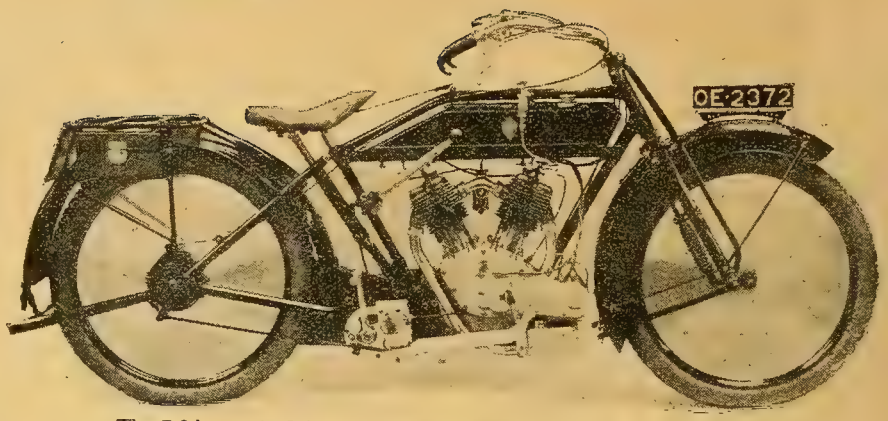
L.M.C. (70.)

6-7 h.p.; 79×86 mm. (842 c.c.); twin-cylinder four-stroke; side-by-side valves; drip feed lubrication; B. and B. carburetter; M-L chain-driven magneto; three-speed Sturmey-Archer gear; chain drive; 650×65 mm. tyres. Price £147 10s.

LLOYD MOTOR ENGINEERING CO., LTD., Monument Road, Birmingham.—No great change has taken place in the general lines, but special attention has been paid to the design of a machine for overseas use. Larger wheels and tyres are fitted, all-enclosed chain drive is adopted, and, of course, this model is eminently suitable for home use also. On the standard model a chain guard is fitted to the top portion of the chain only. A special feature is the saddle and footboard suspension system, which gives a very flexible and easy riding motion. As regards engine design in the case of the 8-9 h.p. model, the stroke is lengthened, the bore being the same. Silencing has been well carried out, and a large cast aluminium box silencer is fitted, with an extension pipe. Cast aluminium footboards and mudguards of ample size are good features, and the black finish with gold lines is pleasing, and, at the same time, very serviceable. Accessibility of the various components has been carefully studied, and, altogether, both models are sound reliable jobs. The 6-7 h.p. model may also be had with chain and belt transmission.



As a solo mount, the new 3½ h.p. Martinsyde is an attractive proposition. The overhead exhaust valve and the main features of the large model are retained.

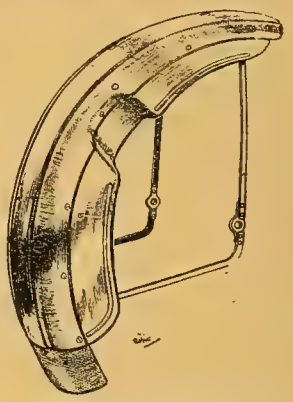


The 7-9 h.p. twin L.M.C. with disc wheels is notable for its clean lines.

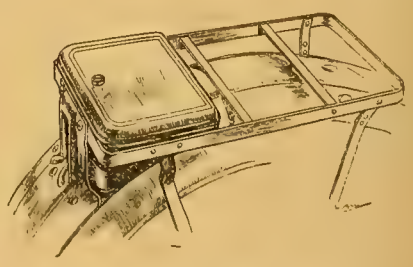
HARLEY-DAVIDSON. (29.)

7-9 h.p.; 84.1×88.9 mm. (998 c.c.); V twin-cylinder four-stroke, overhead inlet valves; mechanical lubrication; Schebler carburetter; Remy chain-driven ignition and lighting generator; three-speed countershaft gear; chain drive; Goodyear or Firestone 28×3in. tyres. Price £196 magneto model.

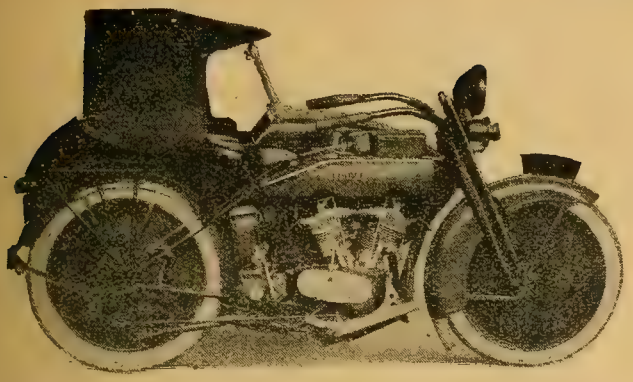
THE HARLEY-DAVIDSON MOTOR CO., Harleyson House, Newman Street, W.1.—To the mechanically minded one of the most attractive features on this stand is the part section of the 7-9 h.p. Harley-Davidson electrically equipped power unit, which reveals the evenness of metal in the cylinders, the regularity of the radiating fins, the ingenious mechanical oil pump, and the timing gear of this engine. The Harley-Davidson was one of the first examples of enclosed exhaust valve springs and tappets, thus protecting these important parts from dust and prolonging their life. So far as the complete machine is concerned, there have been few alterations for 1921. The chief of these lies in the design of the front mudguard, which now affords far better protection for the rider. The principal features of last year's model are retained, such as the excellently made



Improved front mudguard with wider valances on the 1921 Harley-Davidson.



On the 1921 electrically equipped flat twin Harley-Davidson, the tool kit is carried in a pressed steel box between the rear mudguard and the luggage carrier.



7-9 h.p. Harley-Davidson electrically-equipped sidecar outfit with disc wheels. Protection for the passenger is a feature of the sidecar.

The new Excelsior Duplex mount has a two-stroke Villiers engine and is intended for either sex.

countershaft gear box, providing three speeds, kick-starter and clutch, the all-chain drive, and a comfortably sprung saddle. Prices of these machines include all accessories, such as electric lamps for the electric model, and acetylene lamps for the magneto model. One of the most interesting of the exhibits is the racing machine, from which great things are expected at Brooklands during the coming year. This has to all intents and purposes a standard engine to which a Schebler carburetter with a large protector over the air intake is fitted. It is single-geared, but is provided with a hand-controlled clutch. Four sidecar models are shown, including two touring models, one sporting model, and a box carrier, while the Harley-Davidson taxi sidecar is to be seen outside the Show.

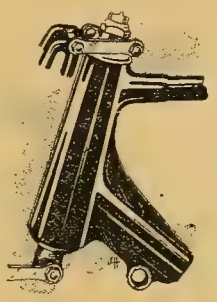
4 h.p.; 70×76 mm. (584 c.c.); twin-cylinder four-stroke; side-by-side staggered valves; mechanical lubrication; Schebler carburetter; Remy combined generator; three-speed in engine unit gear; chain drive; Goodyear 25×3in. tyres. Price £164 10s.

Like the other solo model the 4 h.p. flat twin is shown on a stand provided with a looking-glass so that the underside of the machine may be seen. The engine bristles with ingenious points, such as the heating of the induction pipe from the exhaust manifold, the mechanical lubricator, and the staggered valves. For the first time it is shown fitted with the Remy electrical system, which serves both for the ignition and lighting. This machine has been exceedingly popular during the past year on account of its smooth running and the comfort it affords. It is not yet available for delivery, and it should be noted that the prices mentioned are those of existing stock.

BRITISH EXCELSIOR. (67.)

2¾ h.p. Blackburne; 71×88 mm. (349 c.c.); single-cylinder four-stroke; side-by-side valves; drip feed lubrication; Amac carburetter; M-L chain-driven magneto; two-speed Sturmey-Archer gear; chain and belt drive; 26×2¼in. tyres. Price £96.

BAYLISS, THOMAS AND CO., LTD., King's Road, Tyseley, Birmingham.—An extensive range of lightweight machines is provided by this firm, as in addition to the Blackburne-engined model, with two-speed gear, clutch, and kick-starter, a similar model may be obtained with a 2½ h.p. Villiers two-stroke engine. This, again may be equipped with a plain two-speed gear box, or it may be single-geared, thus providing a range of four models on the same general lines. With footboards, curved mud shields and ample mudguards, the Excelsior should be a lightweight suitable for any weather.



Very noticeable is the massive taper construction of the 8 h.p. Excelsior steering head.

2½ h.p.; 70×70 mm. (269 c.c.); single-cylinder two-stroke; drip feed lubrication; B. and B. carburetter; flywheel magneto; single-speed gear; belt drive; 24×2¼in. tyres. Price £49 10s.

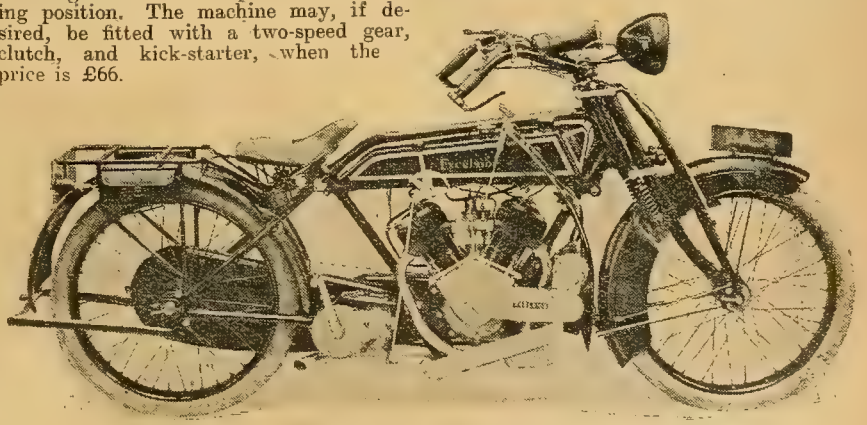
Considerable interest is aroused by the new semi-open frame Excelsior lightweight, as much for its simple and strong construction as for the attractive price at which it is to be marketed. The saddle position is extremely low, but this is not gained at the expense of the riding position. The machine may, if desired, be fitted with a two-speed gear, clutch, and kick-starter, when the price is £66.

4½ h.p.; 86×112 mm. (650 c.c.); single-cylinder four-stroke; side-by-side valves; drip feed lubrication; Amac carburetter; C.A.V. chain-driven magneto; three-speed Sturmey-Archer gear; chain and belt drive; 650×65 mm. tyres. Price £125.

The 4½ h.p. big single model is a modification of a pre-war machine that gained an enviable reputation for sidecar work and hill-climbing. It is designed as a sidecar machine at moderate cost which shall be economical to run, and it is of robust construction. In particular, the strength of the steering head should be noticed. Engine lubrication is another point which has received considerable attention.

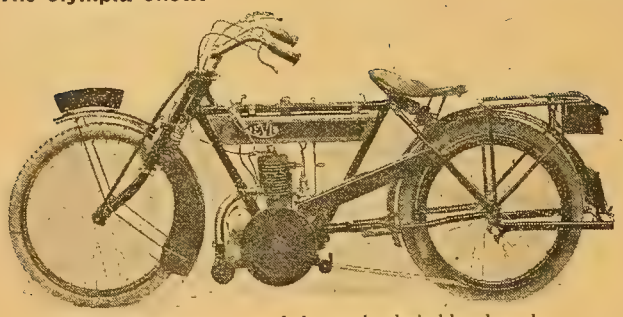
8 h.p.; 85.5×85 mm. (976 c.c.); twin-cylinder four-stroke; side-by-side valves; drip feed lubrication; Amac carburetter; chain-driven Magdyno; three-speed Sturmey-Archer gear; chain drive; 28×3in. tyres. Price £243 3s.

The 8 h.p. model, a luxurious sidecar outfit, is on the same lines as other Excelsior sidecar models, but all-chain drive is employed with interchangeable and detachable wheels, and among the many refinements should be mentioned the fitting of a Lucas Magdyno. This model may also be obtained with either the 6 h.p. J.A.P. engine or with the 10 h.p. Blackburne engine, and if desired it may be purchased as a cheaper model devoid of the ultra luxurious fittings. A new internal expanding front wheel brake is also shown, and will be added in the near future.

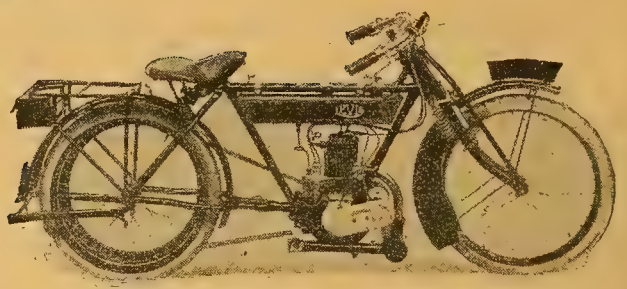


A powerful sidecar mount—the 8 h.p. British Excelsior with Blackburne outside flywheel engine.

The Olympia Show.—



24in. wheels and a neat belt guard, admirably adapt the 2¼ h.p. Levis for ladies' use.

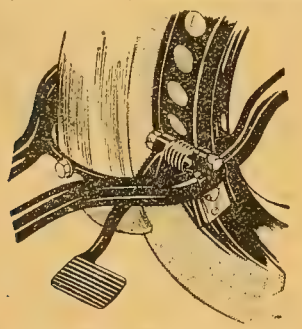


Low, light and speedy—the sports model Levis of 2¼ h.p.

LEVIS. (121.)

2¼ h.p.; 62×70 mm. (211 c.c.); single-cylinder two-stroke; drip feed lubrication; Amac (or other) carburetter; chain-driven magneto; single-speed gear; belt drive; Hutchinson 24×2¼in. tyres. Price £60.

Butterfields, Ltd., Stechford, Birmingham.—Two-strokes as a rule are suspected of being uneconomical—that is to say, their consumption is considered to be high in proportion to their power. Therefore, great interest is being shown in the result of the recent Levis consumption test, when the machine averaged over 20 m.p.h. over a fifty-mile course, with a petrol consumption at the rate of 320 m.p.g. (officially observed by the A.C.U.). In fact, the makers guarantee



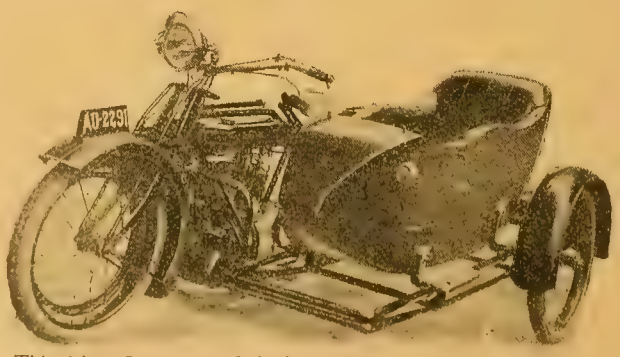
For lightness and simplicity it would be difficult to improve upon the Levis rear brake.

a mileage of 120 to the gallon, and state that the average machine, as it leaves their works, will, with reasonably careful handling, achieve 150 m.p.g. When one realises that, combined with this low consumption, there is the advantage of flexibility (in that the single-gear Levis will two-stroke from 6 up to 35 m.p.h. or more), one begins to appreciate the firm's faithfulness to the single-geared machine. The larger sporting model, of 247 c.c., is also being shown. This is the size of engine which won its class in the 1920 T.T., and is now being marketed at £68. The engine and machine are almost exactly similar to the smaller type, except for the larger bore and stroke and a different silencer. An interesting point is the tank fixing, which is arranged (on rubber buffers) so that the tank and under tube may be removed together by undoing two bolts, thus giving exceedingly easy access to the cylinder. The engine is still lubricated by drip feed, with special pipes to the cylinder and one main bearing, which are a Levis feature. The cylinder feed lubricates the gudgeon pin and the other main bearing, while the direct main bearing feed also oils the big end.

CAMPION. (163a.)

8 h.p. J.A.P.; 85.5×85 mm. (986 c.c.); V twin four-stroke; side-by-side valves; drip feed lubrication; Amac carburetter; Lucas Magdyno; three-speed Sturmey-Archer gear; enclosed chain drive; Dunlop 28×3in. tyres. Price without sidecar £140.

Campion Cycle Co., Ltd., Robin Hood Street, Nottingham; and Nottingham Motor Cycle Taxi Co., Byard Lane, Nottingham.—Although these two firms (in conjunction) intend their vehicle primarily to be a sidecar-taxi outfit, there is no doubt that the luxurious two-seater here staged will appeal in addition to the family man. Another standard Campion outfit of last year's specification is shown; but, as this type is being discontinued, we will confine our description to the two-seater. Regarding the motor cycle itself, a Magdyno is standard; and the rear chain runs in an oil bath gear case, which is different from, and probably neater than, any similar fitment on exhibition. This quality of neatness is gained by the central portion being cut away after the manner of several pedal cycle gear cases. Through the rectangular space thus formed, the rear sidecar connection reaches the lower back stay. Of polished aluminium, the chain case appears to be much narrower and smaller than usual; but perhaps this impression is furthered by the very massive rear band brake casing. Two independent bands act on this drum—one operated by a hand lever, very like the Sturmey gear lever, and the other by a large pedal. All three wheels are quickly detachable and interchangeable. The engine is lubricated by a sight drip feed, surplus oil from the crank case finding its way into the primary and rear chain cases. With the hood in position, the sidecar passenger feels as if he were in a large car. All on, this very elaborate outfit sells at about £250.



This 8 h.p. Campion outfit is shown, but will in the near future be discontinued in favour of the new two-seated "taxi" type.

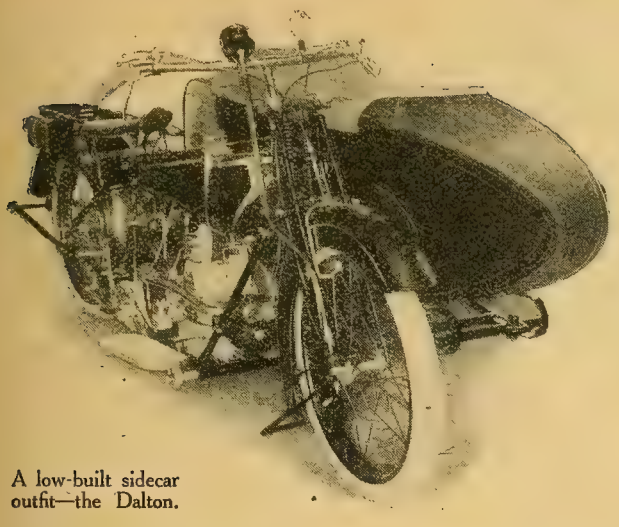
DALTON. (15.)

4 h.p. Blackburne; 85×88 mm. (499 c.c.); single-cylinder four-stroke; side-by-side valves; drip feed lubrication; Amac carburetter; T.B. chain-driven magneto; three-speed Burman gear; chain and belt drive; Wood-Milne 650×65 mm. tyres. Price £115 10s.

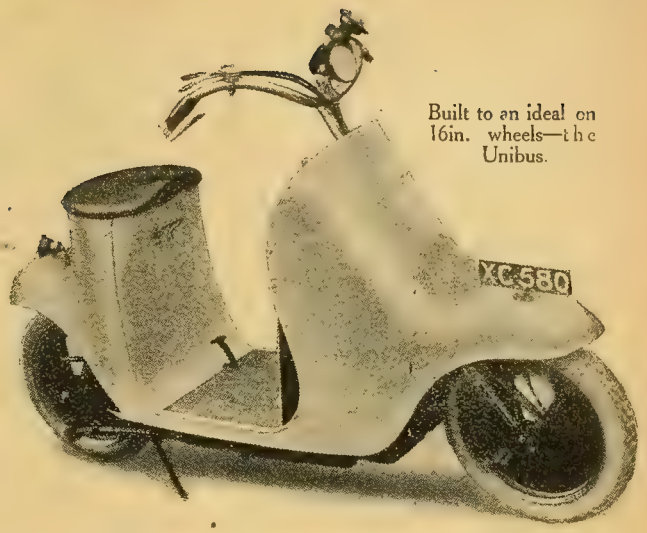
Dalton Motor Co., Ltd., 17-19, John Dalton Street, Manchester.—The 4 h.p. model is an attractive double-purpose mount, suitable for solo riding, and yet sufficiently powerful for a sidecar in all ordinary districts. One of the chief features of this mount is the careful manner in which the mudguarding has been studied. The rear guard extends well over the back wheel, and is provided not only with deep valances, but a special guard over the belt. Footboards sloping to a comfortable angle are provided. As regards the frame, combined lugs are employed where possible, and the toolbag cases are welded on to the carrier, and not held by clips.

2¾ h.p. Blackburne; 71×88 mm. (350 c.c.); single-cylinder four-stroke; side-by-side valves; Best and Lloyd lubrication; Amac carburetter; T.B. chain-driven magneto; two-speed Burman gear; chain and belt drive; 26×2¼in. tyres. Price £99 15s.

The lightweight model is similar in most respects to the 4 h.p. machine, and is a useful solo mount. Its appearance is considerably improved by the fitting of aluminium disc wheels of quite sound design. Both wheels are completely covered in, as the edges of the rims are turned over and allow the discs to fit close up against the rim. The method of fixing is by bolts round the periphery of the discs. In this model, mudguarding



A low-built sidecar outfit—the Dalton.



Built to an ideal on 16in. wheels—the Unibus.

is equally well carried out. Being a lighter machine, footrests are provided instead of footboards.

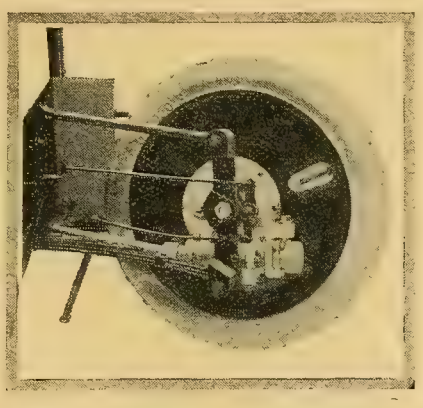
5-7 h.p. Coventry Victor; 75×78 mm. (688 c.c.); twin-cylinder four-stroke; side-by-side valves; Best and Lloyd lubrication; Amac two-lever carburetter; T.B. magneto; three-speed Sturmey-Archer gear; all-chain drive; Dunlop 650×65 mm. tyres.

This handsome sidecar outfit, of medium power and weight, well suited for general touring, is fitted with a smooth-running flat twin engine. Having a three-speed gear box and all-chain transmission, it should be capable of going anywhere. The size of the rear mudguard is worth special comment, while the front guard is well valanced. The frame, being composed almost entirely of straight tubes, is of strong construction, and should stand plenty of rough work.

UNIBUS. (26.)

2½ h.p.; 70×70 mm. (269 c.c.); single-cylinder two-stroke; drip feed lubrication; B. and B. carburetter; C.A.V. chain-driven magneto; two-speed constant mesh gear; shaft and worm drive; Dunlop 16×2½in. tyres. Price ninety-five guineas.

GLOUCESTERSHIRE AIRCRAFT CO., LTD., Sunningend Works, Cheltenham.—One of the most interesting exhibits in the miniature line is the Unibus chassis, which shows distinct originality. The motive power is a 2½ h.p. two-stroke engine set across the frame, which drives through a single dry plate clutch to a two-speed gear box built car fashion across a channel steel frame. From gear box to rear wheel the transmission is by propeller-shaft, on the end of which there is an enclosed worm drive. On the inside of the worm are the two internal expanding brakes, one controlled by hand and the other by foot. The rear wheel of the machine is sprung on quarter-elliptic springs, the wheel being carried in a separate frame. The forks are also provided with leaf springs, which extend from the fork crown to the fork links, and both wheels are of the disc variety. The engine is started by means of a free-wheel hand starter mounted on the dashboard and connected to the engine by a chain. Ease of cleaning and weatherproofing are keynotes of the design.

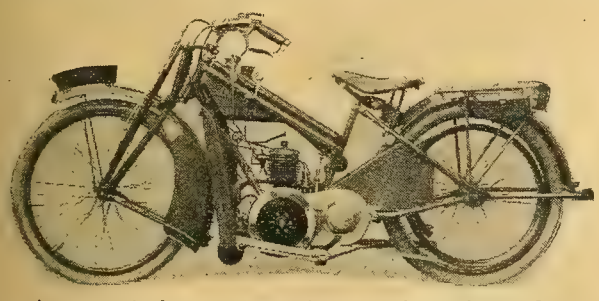


Shaft drive on British machines is found on two extreme types—the miniature and the fully developed three-wheeler. Above is seen the worm-driven rear wheel of the Unibus

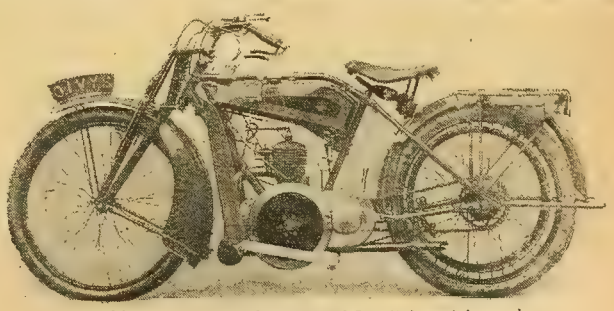
IVY. (124.)

3 h.p.; 75×79 mm. (350 c.c.); single-cylinder two-stroke; drip feed lubrication; Amac carburetter; chain-driven magneto; two-speed Sturmey-Archer gear; chain and belt or chain drive; Dunlop 26×2¼in. tyres. Price £89 solo, £118 with sidecar.

S. A. NEWMAN, LTD., Lichfield Road, Birmingham.—The Ivy two-stroke makes a speciality of working under heavy loads, and has demonstrated its capabilities publicly on more than one occasion of late. In its general layout, the engine is of the standard three-port type with a release valve opening into the exhaust pipe. From the drip feed lubricator two pipes are taken, one conveying oil to the left-hand side of the cylinder, so that it registers with the gudgeon pin at the bottom of the stroke, the other feeding a trough at the top of the crank case, from which the oil runs down special passages to the main bearings. Chain and belt transmission is fitted for solo work, and all-chain for use with the



A compromise between open and diamond frame, the new Ivy lady's model has most of the advantages of both types.



An addition to the wide range of Ivy lightweights—the 3 h.p. "all-chain" type.

The Olympia Show.—

sidecar. The dropped top tube and sloping tank are distinctive Ivy features.

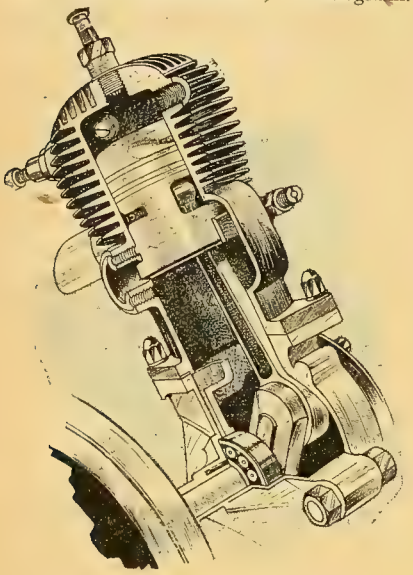
2½ h.p.; 64×70 mm. (224 c.c.); single-cylinder two-stroke; Amac carburetter; chain-driven magneto; two-speed gear; chain-belt drive; Dunlop 26×2¼in. tyres. Price £73.

Except for the smaller engine, this machine is almost exactly similar to the 3 h.p. In both cases the front down tube is double, a tube being taken down on each side of the exhaust pipe. The lady's model is especially neat, and is provided with a semi-dropped frame, one gallon tank, and a carefully protected belt.

SUN. (65.)

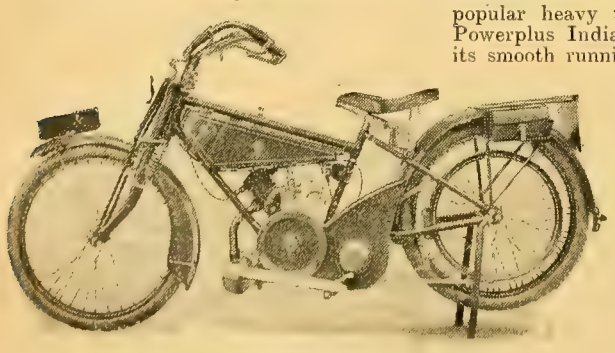
2¾ h.p.; 70×70 mm. (269 c.c.); single-cylinder two-stroke; drip feed lubrication; B. and B. carburetter; T.B. chain-driven magneto; two-speed Sturmey-Archer gear; chain and belt drive; 26×2¼in. tyres.

THE SUN CYCLE AND FITTINGS CO., LTD., Aston Brook Street, Birmingham.

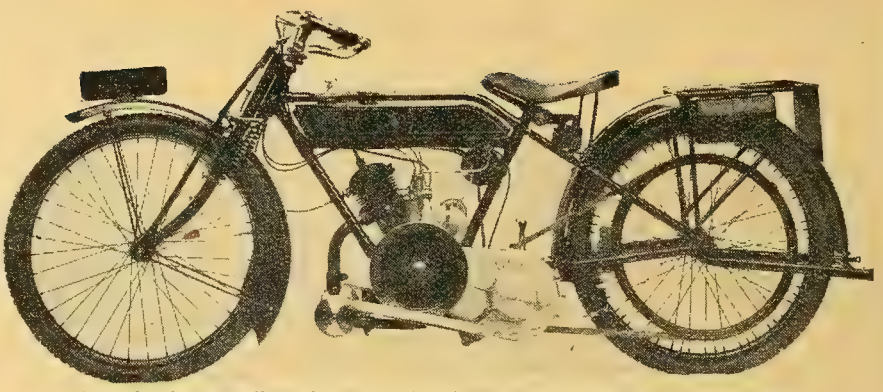


Section of the Sun-Vitesse two-stroke engine. A recess is cut in the crank case to provide lubrication for the roller bearing and main shaft.

—Sun-Vitesse motor cycles are lightweight machines which really are light, and therefore are handy for the hundred



The Sun-Vitesse two-stroke illustrated is one of several lightweights intended for the use of ladies



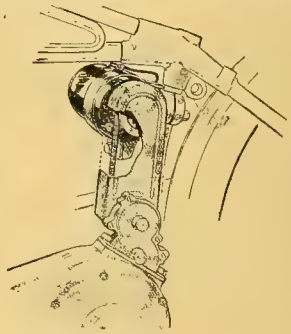
An inclined engine allows the use of a low frame on the Sun two-stroke lightweight.

and one small journeys that are often necessary. The principal changes in the design for this year are the extra roller bearing inside the crank case on the crankshaft, the rollers being caged by chain links, the four-point suspension for the crank case, wider mudguards and forks, a larger tank, and larger toolbags. This list gives some idea of the experimental work undergone during the past season. It will be remembered that the Vitesse engine has a one-piece crank case, whereby joints which may constitute air leaks, a serious matter for crank case compression, are avoided; the additional power and capacity to "rev" being put down largely to this feature. On the stand, beside the ordinary touring models, there is exhibited a neat little ladies' machine in the Show which has a dropped frame to make it a suitable mount, the design requiring little alteration to produce this result. There is also a neat little light sidecar outfit, and one of the models has the new Maglita set. So many, indeed the vast majority of two-strokes, are built-up with proprietary engines that it is refreshing to turn to such a stand as the Sun, where the inclined immediately premises originality.

INDIAN. (100.)

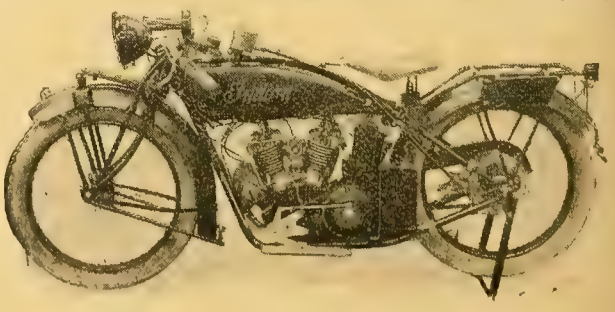
7-9 h.p.; 79×100 mm. (997 c.c.); twin cylinder four-stroke; side-by-side valves; mechanical lubrication; Schebler carburetter; American Bosch gear-driven magneto; three-speed countershaft gear; all-chain drive; 28×3in. Goodyear tyres.

HENDEE MFG. Co., 366, Euston Road, N.W.—There have been few more popular heavy twins than the 7-9 h.p. Powerplus Indian, which, on account of its smooth running, high power, and the comfort afforded by its spring frame, has undergone practically no alteration since its first introduction, but remains particularly suitable for sidecar work on any roads where adhesion is possible. The same careful study which is evident in the design of the engine has been carried on throughout the whole machine. The manner in which the valve springs are



The lighting dynamo on the new Indian Scout is driven from the countershaft through enclosed subsidiary gear wheels and coil *spring* drive to the dynamo pulley. The dynamo is located in a very sheltered position below the saddle mounting, and forward of the seat-pillar tube.

insulated from the hottest part of the engine by means of ventilated distance pieces is an excellent feature, as also is the telescopic arrangement provided for the enclosing of the valve springs and tappets. Not only is the Indian among the pioneer firms as regards satisfactory spring frame, but it was among the first to introduce a reliable system of electric lighting. The Hendee Mfg. Co. employ the Splitdorf generator, which is driven off the crankshaft by means of a spring



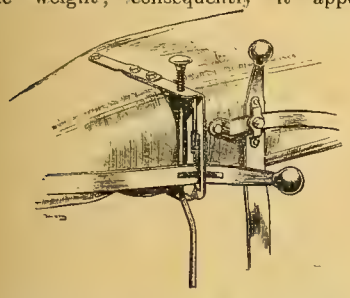
A compact and "nippy" mount is the Indian Scout

The Olympia Show.—

belt, which is totally enclosed. Two of these models are shown fitted with luxurious sidecars, and, handsomely finished in Indian red, make exceedingly striking outfits.

4 h.p.; 70 × 78 mm. (596 c.c.); two-cylinder V twin four-stroke; side-by-side valves; mechanical lubrication; Schebler carburetter; Bosch gear-driven magneto; three-speed countershaft gear; final drive by chain; Goodyear 26×3in. tyres.

The Indian Scout has certainly distinguished itself during 1920, being a solo mount of moderate power and reasonable weight; consequently it appeals



Aluminium knobs are now fitted to the clutch and gear control levers on the Powerplus Indian. Note the new thumb control for raising the exhaust valves when kick-starting the engine.

strongly to the sporting solo rider. One of the most interesting features of this model is the fact that the transmission from engine to gear box is through gear wheels, the final drive being by chain. For the first time this machine is shown fitted with a Splitdorf electrical generator, which is driven by means of an enclosed wire belt from a pulley on the large transmission gear wheel. One solo model is shown, while another machine is fitted with a sidecar of a light and "sporting" build.

RADCO. (61.)

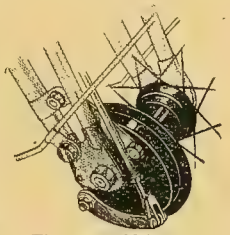
2½ h.p.; 67×70 mm. (247 c.c.); single-cylinder two-stroke; hand pump lubrication; Amac carburetter; Lion chain-driven magneto; two-speed Albion gear; chain and belt drive; 24×2in. tyres.

E. A. Radnall and Co., Dartmouth Street, Birmingham.—On the new Radco sporting model all non-essential parts have been eliminated, yet there is everything that could assist the rider to attain the required end. Footrests, naturally, have superseded foot plates in this type; the engine is standard, as also the transmission, but the equipment includes knee grips; the bars are dropped and aluminium discs give a distinctive air to the 24in. wheels. A long pipe conducts the exhaust gases well away from the aluminium silencer, and this pipe is substantially stayed fore and aft to prevent rattle. An improvement this year, in addition to the enlarged engine, is that the decompressor discharges into the main silencer pipe instead of into the atmosphere. It is possible to drop the engine from the frame when three bolts have been withdrawn and the engine controls disconnected. The touring models range from a simple single gear mount to a machine equipped with two-speed clutch and kick starter, and a Maglita lighting and ignition set arranged in lieu of the magneto. A Flexa saddle suspension pillar is fitted to one of the standard models.

VELOCETTE. (123.)

2¼ h.p.; 62×73 mm. (220 c.c.); single-cylinder two-stroke; mechanical lubrication; Amac or B. and B. carburetter; gear-driven magneto; two-speed constant mesh gear; all-chain drive; Dunlop 24×2¼in. tyres. Price £75.

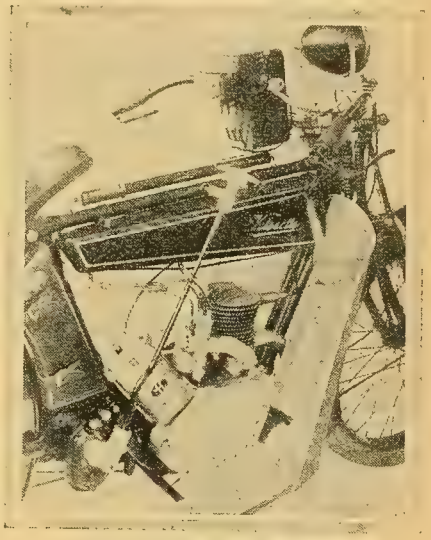
Veloce, Ltd., Victoria Road, Aston, Birmingham.—As the Velocette was recently described in *The Motor Cycle*, only a short *résumé* of its most prominent points will be given here. One of its chief attractions is the complete mechanical lubrication, which relieves the rider of all responsibility beyond refilling the sump every 500 miles or so. On one of the models exhibited, the M-L magneto lighting set is fitted, making an admirably complete machine. The sectioned engine and gear box, which show the action of all working parts, also create considerable interest.



The 1921 Velocette has an internal expanding front wheel brake.

A lady's machine, selling at £88, is also shown. It has a three-speed gear, and is of similar specification to the other model except for its frame. The 24in. wheels provide an extraordinarily low saddle position, the top of the saddle being only 26½in. from the ground. Unlike many ladies' models, the petrol tank is of full capacity, holding over two gallons.

A competition model, with three-speed gear and expanding front brake, should be specially noted on account of the excellent show which the firm's team put up in the A.C.U. Six Days Trials, in which they took third place for the team prize against much more powerful machines.



An example of the 2¼ h.p. Velocette with M-L Maglita lighting and ignition set.

The price of the three-speed model is £85. All-chain drive is an unusual feature on so small a machine, and the Velocette gives the impression of having been "designed" throughout. The detail work is well carried out throughout, and its all-black finish, relieved by gold lines, is specially good.

CLYNO. (141.)

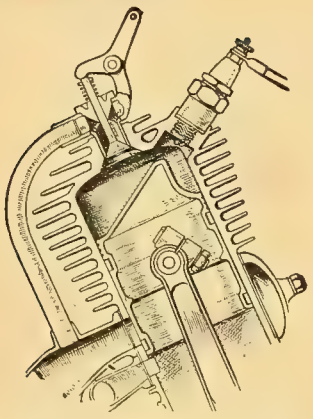
8 h.p.; 76×102 mm. (925 c.c.); V twin four-stroke; side-by-side valves; mechanical lubrication; Amac carburetter; T.B. chain-driven magneto; three-speed constant mesh type gear; enclosed chain drive; spring frame; Dunlop 28×3in. tyres.

Clyno Eng. Co., Ltd., Pelham Street, Wolverhampton.—Nature decrees that we desire most earnestly the unattainable. For this reason close interest in the 8 h.p. Clyno has been and is intense, and now that deliveries are definitely commencing, that interest, by reason of the sheer completeness of the design, will not flag Of Clyno manufacture

A two-stroke, two-speed Radco fitted with polished wheel discs

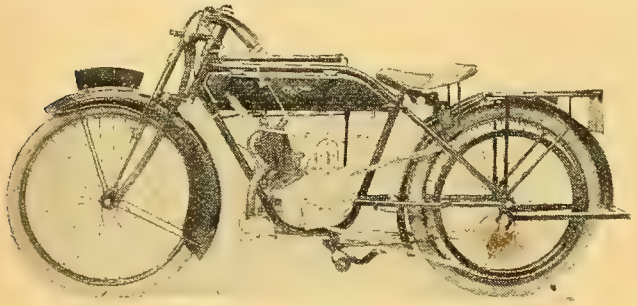
Compactness has been gained without sacrificing accessibility on the Velocette ladies' machine

The Olympia Show.—



Section of the Clyno two-stroke engine showing port arrangement.

and design, the engine has detachable cylinder heads and a carefully planned system of mechanical lubrication. In addition a hand pump may be used at will to supply extra oil either to the crank case or to the constant mesh type gear box. The spring frame is simplicity itself, and includes the carrier in its total of sprung weight. Detachable and interchangeable wheels naturally find a place in the standard specification; removal of the rear wheel leaves the internal expanding rear brake *in situ*, also, of course, the transmission. Mudguarding is literally on car lines, *and* to car dimensions. The *modèle de luxe* has full electrical equipment; but even the standard machine is exceptionally complete. War and peace have provided experience and testing grounds for the Clyno designers, of which they have not been slow to take advantage.



Competition work has proved the Clyno lightweight to have reached an advanced stage of design.

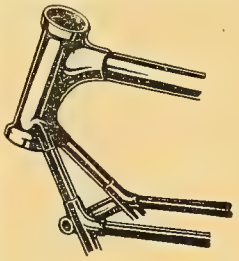
$2\frac{1}{2}$ h.p.; 70×70 mm. (269 c.c.); single-cylinder two-stroke; drip feed lubrication; Amac carburetter; gear-driven magneto; two-speed gear integral with crank case; belt drive; 26×2in. tyres.

Right at the other end of the scale the Clyno lightweight is as complete and clever in its design as is the big passenger outfit. The integral gear box and inclined two-stroke engine are well-known features, but the fact that, including the magneto pinion, only five gear wheels are used in the primary drive and gear box is worthy of especial note, and is indeed significant of the simplicity that is maintained throughout the whole machine.

RALEIGH. (99.)

5 h.p.; 77×75 mm. (700 c.c.); flat twin four-stroke; side-by-side valves; drip feed lubrication; Amac carburetter; gear-driven magneto; three-speed Sturmey-Archer gear; all-chain drive; Dunlop 650×65 mm. tyres. Price £162 15s. solo; £204 15s. with sidecar.

Raleigh Cycle Co., Ltd., Nottingham. —Although it was exhibited at last year's Show, the flat twin Raleigh has only lately been put into production. In fact, the Show exhibits are the first production samples, so that the machine has not yet been seen much on the road, and is probably not familiar to readers. Perhaps the most noticeable point about it is its neatness, when one considers that the engine is a flat twin of 700 c.c. This is partly due to the fact that the engine is of larger bore than stroke, and partly to the extremely neat arrangements of the special Sturmey-Archer gear box, the casings and controls of which have been modified to suit the machine. Detail work is especially good: the wheels have knock-out spindles; the front brake has a compensating shoe which cannot possibly drag on the dummy belt pulley when the brake is off; the duplex frame is most thoughtfully laid out, and has been strengthened in the saddle tube. The arrangement of the saddle, sliding on a horizontal extension of the top tube, gives an exceptionally low and comfortable saddle position, which, in combination with the sprung rear frame, should make the machine most pleasant to ride. One specially good point about the arrangement of the spring frame is the fact that the rear mudguard is made in two pieces, of which the hinder is rigid with the wheel, while the front part pivots with the sprung part of the frame. The result is that no amount of spring movement can cause any fouling of the mudguard.



The sidecar lug forms a cross support of the Raleigh duplex frame.

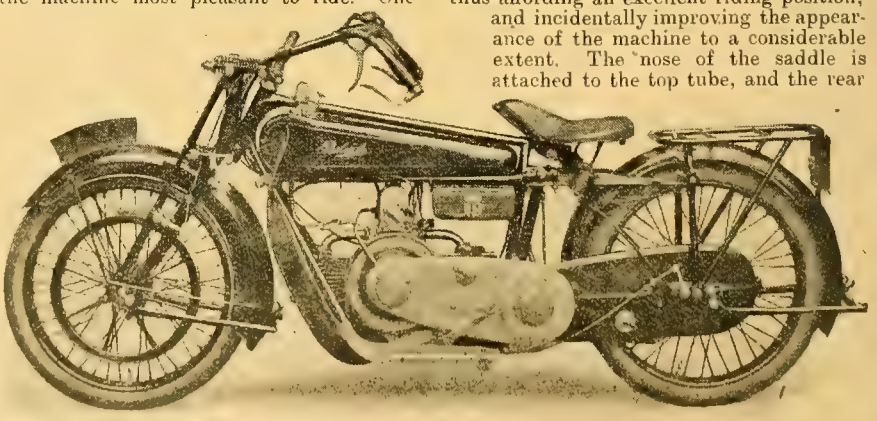
COULSON B. (162.)

4 h.p. Blackburne; 85×88 mm. (499 c.c.); single-cylinder four-stroke; side-by-side valves; drip-feed lubrication; Flixi carburetter; chain-driven magneto; three-speed Sturmey-Archer gear; chain and belt drive; spring frame; Avon 26in.×2½in. tyres.

$2\frac{3}{4}$ h.p. Blackburne; 71×88 mm. (349 c.c.); single-cylinder; in other respects as 4 h.p. model.

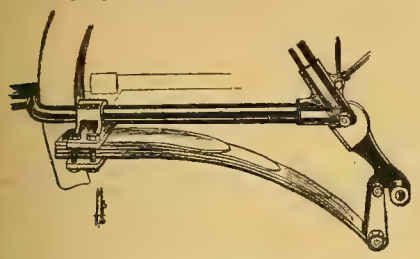
F. Aslitt Coulson Engineering Co., Ltd., Albion Street, King's Cross, N.W.1.—Although a comparative newcomer, the Coulson B is already a well-established favourite. This quick rise to popularity may be accounted for by the fact that the company make their machines, and do not merely assemble them. The engine and gear box, however, are proprietary units—the former, the well-known 4 h.p. Blackburne with outside flywheel, and the latter the equally familiar Sturmey-Archer. By entirely redesigning the frame the saddle position has been lowered as much as six inches, thus affording an excellent riding position, and incidentally improving the appearance of the machine to a considerable extent. The nose of the saddle is attached to the top tube, and the rear

Quarter-elliptic springs are used at the Coulson sidecar wheel, following the same lines as the suspension of the motor cycle.



Large flat twins generally appear unsymmetrical. Not so this 5 h.p. Raleigh—even the spring frame is the essence of neatness.

The Olympia Show.—



Details of Coulson-B spring frame.

coil springs to a special bracket. In conjunction with a spring rear frame, the comfort of the rider receives great attention. Made throughout at the company's works, the tank is a good example of modern reinforced design. Internally it possesses a double division between the oil and petrol compartments, and the external finish and outline are most pleasing. This model has sidecar lugs cast integrally with the frame; the 2¾ model lacks these, but otherwise is very similar. Adjustable handle-bars are standard fittings on both models. The 4 h.p. model is perhaps the only 500 c.c. machine which, complete with spring frame, three-speed gear, and clutch, weighs less than 200 lb., and therefore will be subject only to a 30s. tax. The smaller machine may be obtained with two or three-speed gears.

CEDOS. (36.)

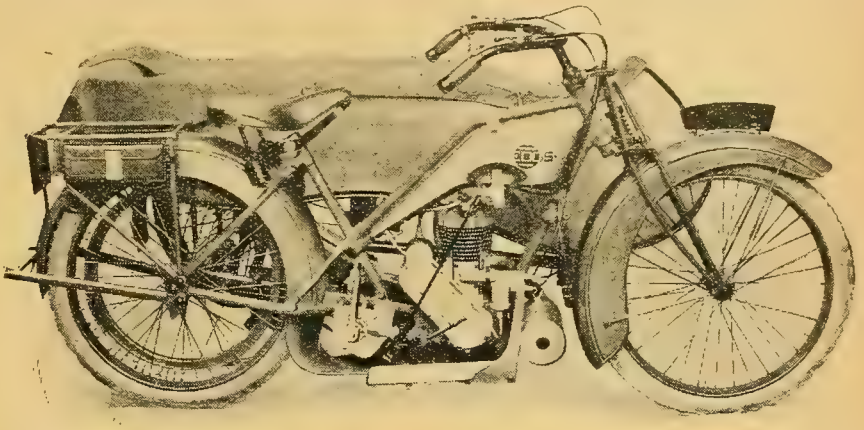
2¼ h.p.; 62×70 mm. (211 c.c.); single-cylinder two-stroke; drip feed lubrication; Cedos carburetter; Runbaken chain-driven magneto; two-speed countershaft gear; chain and belt drive; Denton or Hutchinson 24×2¼in. tyres. Price, lady's model, £75 12s.; standard, £73 10s.

HANWELL AND SON (COMPONENTS), Northampton.—The Cedos motor cycle is full of interesting points. It has not been greatly altered since last year, but one of the modifications lies in the exhaust pipe, which is now carried underneath the engine-shield. This shield is a remarkably good feature, as it protects the engine, gear box, belt, and chain from mud thrown up by the front wheel. The manufacturers of the Cedos are also among those who specialise in a lady's machine. It is well designed, strongly constructed, and every detail is carefully thought out. The gear box is carried eccentrically in a circular bracket, so that to tighten the chain it is only necessary to alter the centre of the gear box merely by means of the adjusting screw, while there is no danger of interfering with the chain alignment. Petroil lubrication, where the lady's model is concerned, has been regarded as undesirable owing to the chances of its fair passenger soiling her attire; the makers are using a drip feed in conjunction with a hand pump.

A new model, having a bore of 67 mm. and a stroke of 70 mm. (247 c.c.), is fitted with an entirely new engine, which possesses several interesting features. Unlike most two-strokes, it has a detachable head, which has exceptionally large radiating surface. The lugs through which the holding-down bolts pass are in themselves radiating fins. The cylinder is a very fine piece of work, in which the ports are not cast, but machined. By this process greater accuracy can be obtained. The piston is the Cedos registered design, in which ports are cut for the purpose of transferring the gas to the underside of the piston. The transfer port is covered by a special aluminium cover.

The engine is most carefully thought out in every detail. The roller bearing big end is a particularly fine piece of design, while bronze bushes are employed fitting up against the Skefko journal main shaft bearings for the purpose of retaining the compression. These bushes cannot wear unless the ball bearings wear. They are provided with grooves specially cut so as to direct the oil into the engine.

The machines are now enamelled in black, and their finish is greatly improved. A lady's model is also shown fitted with a 247 c.c. engine, a gear box and kick-starter, handle-bar controlled clutch, and a lightweight sidecar.

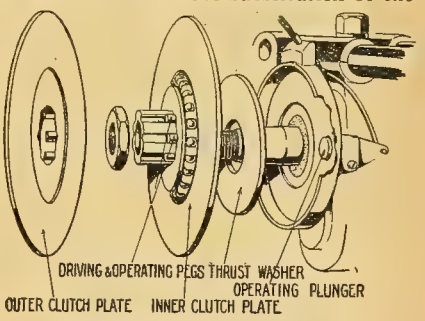


Ladies will be particularly attracted by the Cedos open-framed lightweight fitted with a light sidecar.

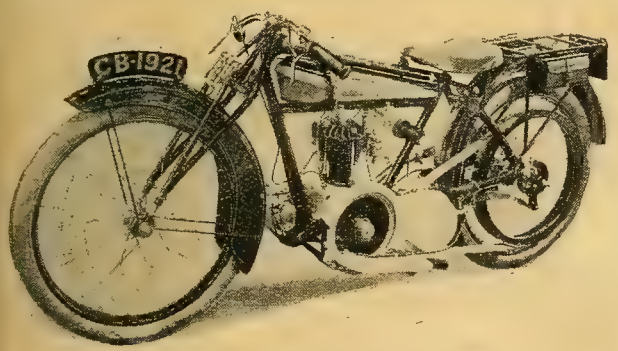
SPARKBROOK. (122.)

2½ h.p.; 70×70 mm. (269 c.c.); single-cylinder two-stroke; drip feed lubrication; B. and B. carburetter; flywheel magneto; two-speed Sparkbrook sliding gear; chain-belt drive; Dunlop 26×2in. tyres. Price £70.

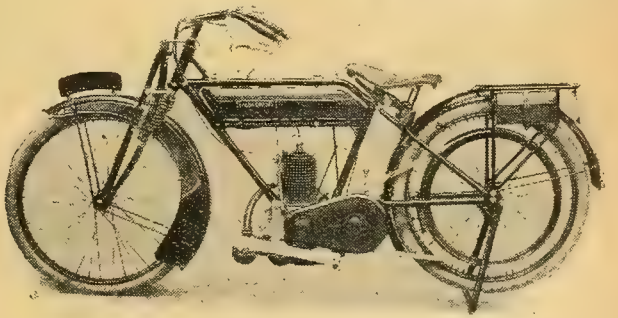
SPARKBROOK CYCLE CO., Coventry.—It is remarkable how the substitution of the flywheel magneto on the Villiers engine helps to produce a clean appearance on this machine. This, of course, is in addition to the other advantages of excellent low speed sparking and low weight. The combined result of the flywheel magneto and the excellent design of the



Details of the Sparkbrook clutch control



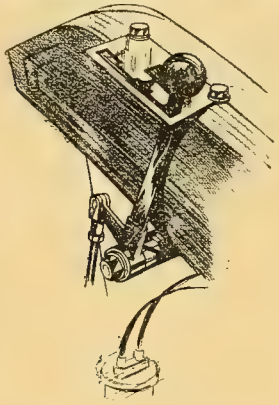
A Coulson-B 4 h.p. three-speed spring frame mount



The Sparkbrook-Villiers two-stroke lightweight

The Olympia Show.—

Villiers piston and ports is to produce a two-stroke machine with the slow running qualities of the four-stroke as well as very good speed capabilities. One excellent point about the Sparkbrook machine is the extra sized countershaft belt pulley which has been fitted to prevent belt slip, even under the worst conditions. A simple countershaft clutch has just been introduced. It is to be noted



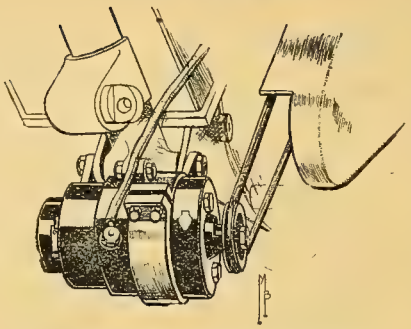
Neat change-speed lever of the lightweight Sparkbrook.

that even the single-speed machine (priced at £64) is not directly driven, but has a simple countershaft with the same 7in. belt pulley.

READING STANDARD. (37.)

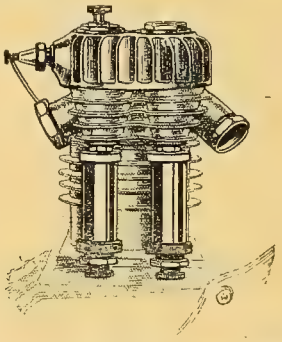
10 h.p.; 85.8×95.4 mm. (1,170 c.c.); twin-cylinder four-stroke; side-by-side valves; mechanical lubrication; Schebler carburetter; Splitdorf gear-driven magneto; three-speed countershaft gear; chain drive; Firestone 28×3in. tyres.

STANLEY J. WATSON, 37, Sheen Road, Richmond, Surrey. — The Reading Standard was one of the first American-made motor cycles that conformed in design to British ideas as to valve disposition. It is, however, rather more up-to-date than many British machines in that mechanical lubrication is fitted. Like all American big twins it is strongly constructed, made to withstand rough roads, and is provided with a comfortable saddle. The current for the electric lighting is supplied from a Splitdorf generator. Following American practice the clutch can be actuated either by the foot or by hand, and unless the clutch is withdrawn the gear



On the Reading Standard the dynamo is mounted in front of the engine and driven from a pulley on the crankshaft.

lever cannot be moved owing to the interlocking device provided. The models shown are all fitted with sidecars with the exception of one.



The new cylinder head of the Reading Standard. The valve springs are enclosed in cases with a locking ring beneath.

Although the engine is rather larger than is fitted to British motor cycles the complete machine is compactly arranged, and is not clumsy in appearance.

PRIORY. (6.)

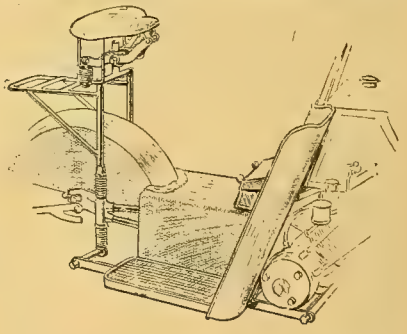
2½ h.p. Arden; 70×70 mm. (269 c.c.); single-cylinder two-stroke; hand pump lubrication; B. and B. carburetter; C.A.V. chain-driven magneto; two-speed Albion gear; chain and belt drive; Hutchinson 26×2½in. tyres.

DERRY AND EDWARDS, 1, Great Eastern Street, London, E.C.1.—The 2½ h.p. two-stroke Priory is an attractive little mount of handsome appearance, with Ace disc wheels, which are particularly well finished. With wide and well valanced mudguards, it appears to be a thoroughly practical little mount. A casting forms a Y shaped branch for the twin exhaust pipes, which lead to an expansion chamber of generous dimensions. The exit for the gases is amply large, and a long tail pipe is fitted. The two-speed Albion gear incorporates a handle-bar controlled clutch. Points of convenience have been well studied; comfortable aluminium footboards are provided and a neatly finished aluminium chain cover. The Arden front forks, which are built of welded sheet steel, are quite a noteworthy feature of the machine.

KENILWORTH. (144.)

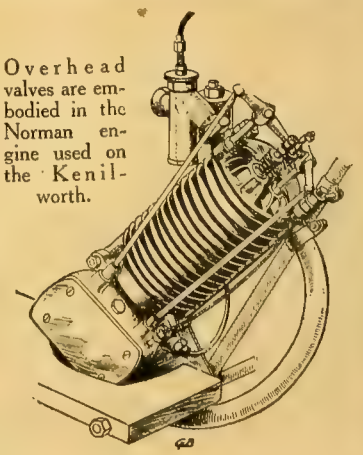
1¼ h.p. Norman; 55×60 mm. (142.5 c.c.); single-cylinder four-stroke; overhead valves; drip feed lubrication; single-lever carburetter; Runbaken direct-driven magneto; single-speed gear; belt and chain drive; Kenilworth 18×2in. tyres. Price £52 10s.

BOOTH BROS., Much Park Street, Coventry.—Although originally a scooter, the fact that it possesses a seat, and that the steering head is triangularly supported by duplex tubes from the main frame, makes the Kenilworth actually a miniature motor cycle. The diminutive Nor-

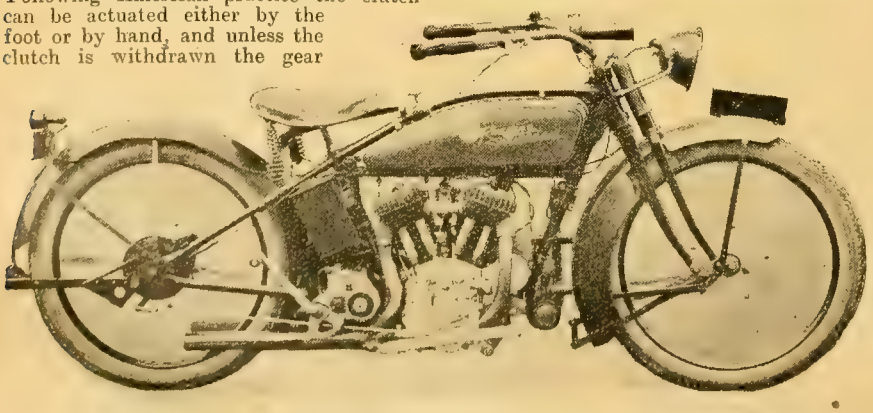


On the Kenilworth scooter (which is propelled by a Norman engine) the seat and footboards are sprung in unison.

man engine is remarkably efficient for its size, and a simple saddle suspension connected with the footboards allows quite long journeys to be undertaken in comfort. Legshields and a carrier are now fitted, as is a capable-looking band brake on the

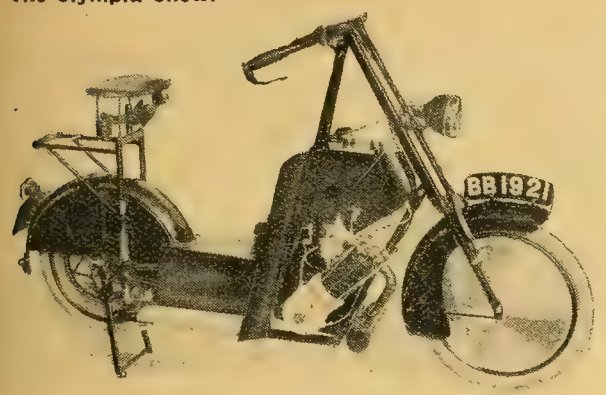


Overhead valves are embodied in the Norman engine used on the Kenilworth.



Among the interesting points of the Reading Standard is the fact that it has the largest engine of any motor cycle in the Show.

The Olympia Show.—



The Kenilworth Scooter has straight triangulated tubes.

rear wheel. Altogether, the Kenilworth strikes one as being a thoroughly practical little machine that will stand much hard use and abuse, and which, by reason of its 80 lb. total weight, possesses exemplary docility and convenience. Its mudguarding might well be studied by some designers of more ambitious machines costing three times as much. A neat electric lighting set is supplied at £4 4s. extra.

ENFIELD. (118.)

8 h.p.; 85.5×85 mm. (976 c.c.); two-cylinder V twin four-stroke; side-by-side valves; mechanical lubrication; Amac carburetter; chain-driven magneto; two-speed Enfield selective clutch gear; all chain drive; Palmer cord 700×80 mm. tyres Price with sidecar £160.

ENFIELD CYCLE CO., Redditch.—Vickers, Ltd., who are manufacturing the new engine for the Royal Enfield combination, have already such a well-deserved reputation that one cannot doubt the quality of their product. The engine itself, which was described in the last issue of *The Motor Cycle*, is of the standard V twin type, but has fully forced lubrication by a very accessible pump outside the timing case. An auxiliary hand pump is also provided. The Enfield two-chain drive to the countershaft, with selective clutch gear change, is retained, as also the handle starter: in fact, apart from the new engine, there is but little change in the outfit, except that a very neat removable rear mudguard and stand is now fitted. Probably the most remarkable point about the outfit is that a machine of such splendid quality and performance should be offered at a price which is smaller than is asked for many single-cylinder sidecar machines of half the power. Both large and small models are fitted with Enfield spring drive to absorb any chain snatch.

2¼ h.p.; 64×70 mm. (225 c.c.); single-cylinder two-stroke; petroil lubrication; Amac carburetter; chain-driven magneto; two-speed selective clutch gear; all-chain drive; Palmer 24 × 2in. tyres. Price £65.

The most novel point of the Enfield lightweight is the optional incorporation of a kick-starter, adapted to the Enfield two-speed gear. The countershaft has a gear wheel on its extreme end, and a gear sector is fitted to an extension of the front chain stay lug. The magneto drive is also noteworthy as an example of simplicity in design: it is driven by the low speed chain from engine to countershaft, which forms, as it were, a triangular drive, including engine sprocket, magneto sprocket, and countershaft sprocket.

NEW IMPERIAL. (91.)

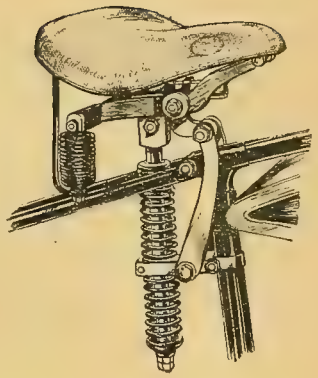
2¾ h.p.; 70×76 mm. (292 c.c.); single-cylinder four-stroke; side-by-side valves; drip feed lubrication; B. and B. carburetter; E.I.C. chain-driven magneto; two-speed sliding dog gear; chain and belt drive; 26×2¼in. tyres. Price £89 5s.

NEW IMPERIAL CYCLES, LTD., Birmingham.—A light machine, which should be capable of going anywhere, and which has, in fact, proved its prowess in many competitions, is the 2¾ h.p. New Imperial. Little alteration has been made, but the New Imperial gear box is now standardised, the gears being constantly in mesh, and the different ratios obtained by sliding dog clutches.

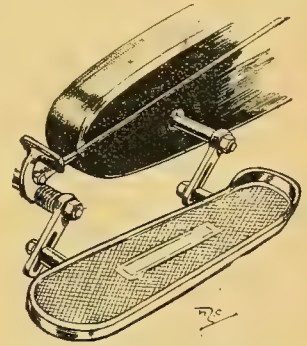
Chain and belt transmission is employed, with a handle-bar-controlled clutch, and an enclosed kick-starter. Saxon spring forks are now fitted, and the front guard is of particularly wide section for so small a machine. As previously, the J.A.P. engine is relied upon, and is efficiently silenced by a cylindrical exhaust box carried under the timing gear, and fitted with a long extension pipe. If desired, this model may be obtained with M-L Maglita electrical equipment, and also with a plain two-speed gear box, the price being £80 17s.

8 h.p.; 85.5×85 mm. (976 c.c.); twin-cylinder four-stroke; side-by-side valves; drip feed lubrication; B. and B. carburetter; E.I.C. chain-driven magneto; three-speed sliding dog gear; chain drive; 28×3in. tyres. Price £147.

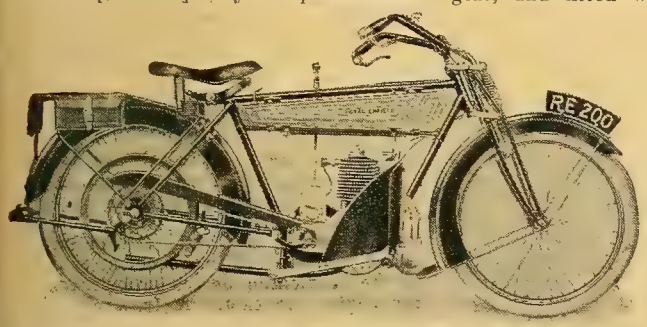
As a substantial and powerful machine for sidecar work, the 8 h.p. twin J.A.P.-engined New Imperial is a good example. Brampton forks are fitted to this model, with 28in. wheels, and completely enclosed all-chain drive. An introduction this year is the use of curved knee-guards, which enhance rather than detract from the appearance of the machine.



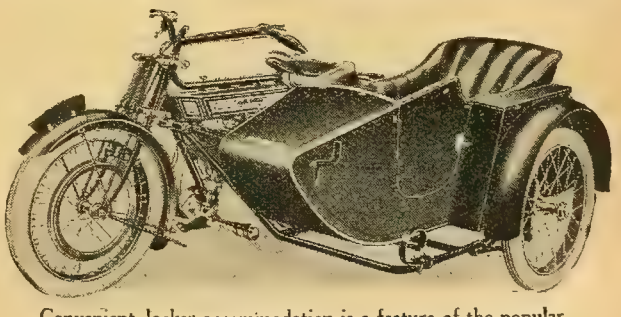
For easy riding a supplementary spring is fitted to the seat-pillar on the big twin New Imperial.



On the New Imperial the foot plates are adjustable horizontally and vertically.

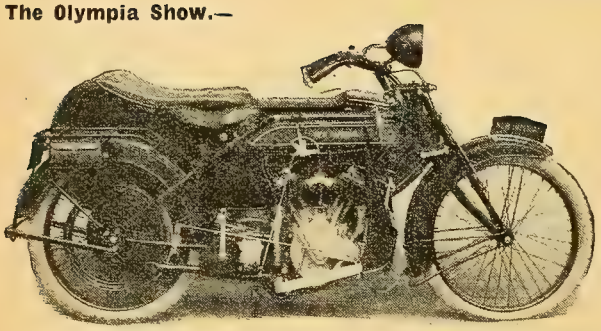


Straight tube framework on the Enfield lightweight gives a quite pleasing outline.

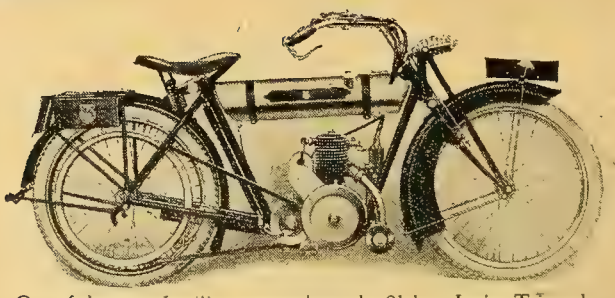


Convenient locker accommodation is a feature of the popular Enfield outfit, now fitted with an 8 h.p. twin engine made by Vickers, Ltd.

The Olympia Show.—



A sturdy sidecar machine is the 8 h.p. J.A.P. engined New Imperial.



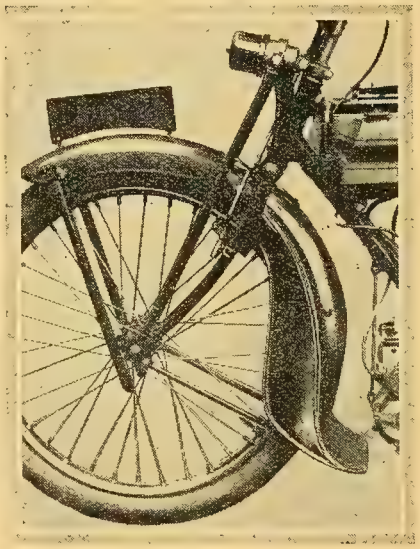
One of the most familiar two-strokes—the 2¼ h.p. Junior Triumph.

The rear brake is now lined with Ferodo, and is most efficient, the shoe operating in a dummy belt rim. A point which makes for the comfort of the driver is that the footboards may be adjusted, and a refinement is a coil spring saddle mounting. Substantial chain cases are fitted, which would, nevertheless, be readily removable in case of necessity. This model may be fitted with Lucas Magdyno electrical equipment, this, of course, being an extra. The price with sidecar is £186 18s.

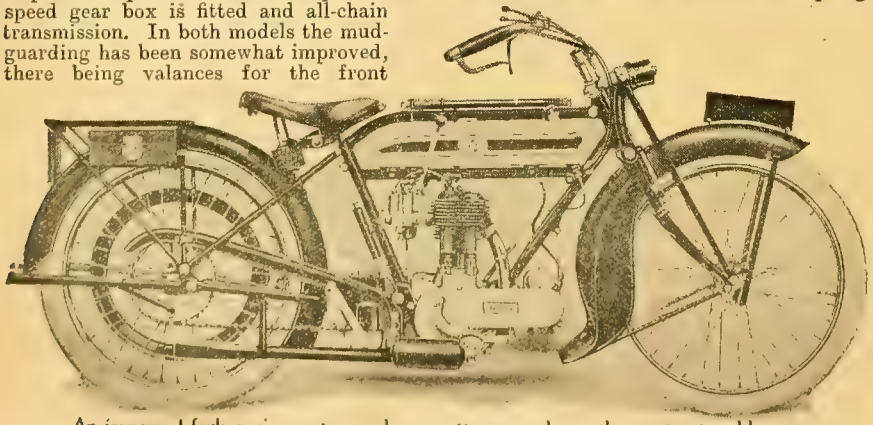
TRIUMPH. (114.)

4 h.p.; 85×97 mm. (550 c.c.); single-cylinder four-stroke; side-by-side valves; hand pump lubrication; Triumph carburetter; M-L chain-driven magneto; three-speed Sturmey-Archer gear; chain-belt drive; 26×2½in. tyres.

Triumph Cycle Co., Coventry.—Though the modifications in the 4 h.p. Triumph for 1921 have been in the shape of detail improvements only, there is little doubt that the Triumph stand will be, as usual, a centre of attraction. One point which will be much appreciated is the provision on the sidecar models of footboards instead of footrests. These are of all metal with aluminium edgings. Another ingenious improvement consists in the provision of vertical troughs, which form the front mudguard stays, which are designed to catch the liquid mud thrown up by the front wheel, allowing it to trickle on the ground, and preventing it from flying over the driver or the sidecar passenger. The chain-driven model is similar in practically every respect except that the Triumph three-speed gear box is fitted and all-chain transmission. In both models the mudguarding has been somewhat improved, there being valances for the front guard, while the rear guard is wider. Four sidecar models are shown, and one of these is equipped with the Triumph gear box, all-chain transmission is provided, and the Lucas Magdyno. A transmission shock absorber is now fitted to both chain and belt-driven models. Among the interesting parts shown on the stand is an example of the spring for the Gloria sidecar. It is of the enclosed coil spring variety, and is provided with a check spring of volute pattern, which should do much to increase the comfort of the passenger in the sidecar, and relieve the chassis from strain.



Little or no mud should be able to get past the new Triumph guard. Note also the enclosed fork springs.



An improved fork spring system and new pattern guards are the most noticeable alterations in the chain-drive 4 h.p. Triumph.

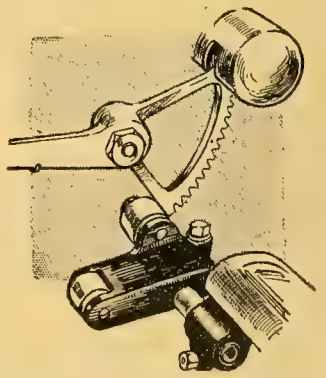
2½ h.p.; 64×70 mm. (225 c.c.); single-cylinder two-stroke; petroil lubrication; Triumph carburetter; chain-driven Maglita; two-speed countershaft gear; chain and belt drive; Dunlop 24×2¼in. tyres.

This has long been a popular and economical solo mount for both sexes. Fitted with the Maglita lighting and ignition set, it is altogether a thoroughly attractive little proposition, possessing excellent features of design and the wonderful Triumph finish. Noteworthy points are the size of the rear brake shoe and the peculiar method of actuating the change-speed, which is through a Bowden pattern lever on the handle-bars.

P. and M. (74.)

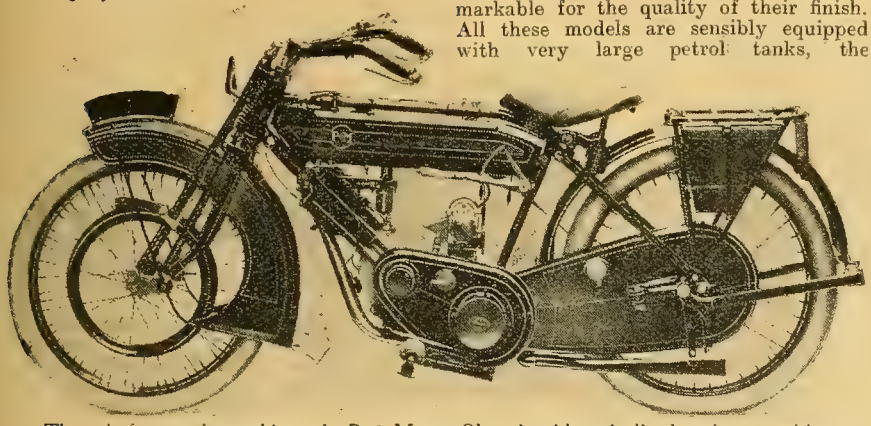
3½ h.p.; 83×89 mm. (498 c.c.); single-cylinder four-stroke; side-by-side valves; mechanical lubrication; B. and B. carburetter; E.I.C. chain-driven magneto; two-speed expanding clutch gear; chain drive; 26×2½in. tyres. Price £125.

Phelon and Moore, Ltd., 4, Berners Street, London, W.1.—Minor alterations only have been effected in the popular 3½ h.p. P. and M. The front brake is now a shoe of compressed Ferodo operating in a dummy belt rim on the wheel, and another improvement is found in the cushioning device incorporated in the engine sprocket. A feature of this machine is, of course, the mechanical lubrication, which consists of a pump positively driven by a worm formed on the exhaust cam wheel. This pump



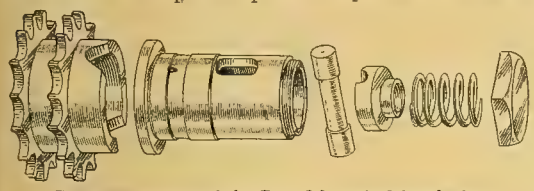
Rubber buffers on the P. and M. kick-starter which act as stops at either end of the stroke.

The Olympia Show.—



The only four-stroke machine—the P. & M.—at Olympia with an inclined engine, a position adhered to by its designers since its inception well over a decade ago.

forces oil alternately to the cylinder and to the big end, and not the least of the advantages attained is the gain in oil economy. Another interesting feature is the hand brake ratchet in connection with the brake pedal, by means of which the contracting band rear brake may be left on without the driver having to keep a continual pressure upon the pedal. For sidecar use in hilly country, this is a refinement which proves particularly useful. If it is so desired, Lucas dynamo lighting may be provided as an extra, and the small cylindrical dynamo is housed over the crank case immediately behind the cylinder and driven by an enclosed chain from the magneto drive. Two sectioned engines are also exhibited, and the operation of the mechanical lubricator is demonstrated by an electrically-driven model causing considerable interest and attracting a crowd of spectators. Another interesting small point is that the tank is now finished in a benzole resisting enamel, a curious fact being that only a green finish can be obtained in this special material. A subsidiary hand pump is also housed in the tank, to supplement the mechanical lubricator should occasion arise.



Component parts of the P. & M. cush drive device.

BOWN. (174.)

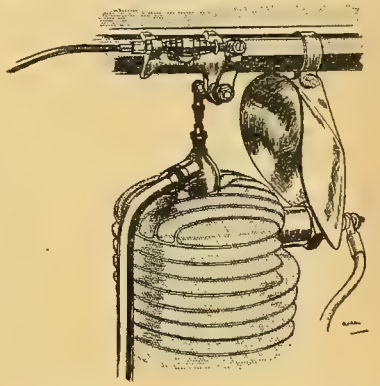
2½ h.p.; 70×70 mm. (269 c.c.); single-cylinder two-stroke; drip feed lubrication; Amac carburetter; flywheel magneto; two-speed Sturmey-Archer gear, with clutch and kick starter; chain and belt drive; 26×2¼in. tyres. Price £68.

Bowns, Ltd., 301, Sumner Lane, Birmingham.—The Bown, which has enjoyed a distinct vogue in the past, has been supplemented for this season by two larger models, equipped with 2¾ h.p. and 4 h.p. Blackburne engines respectively. They are good-looking and workmanlike machines, well fitted together, and remarkable for the quality of their finish. All these models are sensibly equipped with very large petrol tanks, the "saddle" tank of the 4 h.p. holding no less than two and a half gallons. The mudguards are also noticeable for their width. Tanks in both cases are enamelled biscuit, the colouring picked out in chocolate and gold. A careful examination discloses several very clever little fittings on these machines. For example, the foot brake is one of the very few belt rim brakes in the Show which possesses an absolutely direct pull. There is a loop in the middle tube of the Bown frame, which enables the Villiers engine to use any size of sparking plug. The petrol filter at the rear of the tank on the 4 h.p. model is equipped with an ingenious automatic valve, enabling the rider to detach and clean his filter when the tank is full without losing a drop of petrol. Altogether, the new Bown four-stroke models bid fair to surpass the reputation which the little two-stroke has already earned.

NEW HUDSON. (75.)

2¼ h.p.; 60×72 mm. (211 c.c.); single-cylinder two-stroke; drip feed lubrication; B. and B. carburetter; chain-driven magneto; two-speed New Hudson gear; chain and belt drive; 24×2in. tyres. Price: Tourist and sports £75; racing £85.

New Hudson, Ltd., St. George's Works, Icknield Street, Birmingham.—This firm's popular machines are offered in three separate patterns for 1921, of which the special racing model is quite a new divergence. It has a specially balanced flywheel and crankshaft, an aluminium piston, and is guaranteed to be capable of fifty miles per hour. Visitors will notice that the discs fitted to the wheels of this model are several inches less in diameter than the wheel rim; the designer asserts that these "three-quarter discs" entirely prevent side winds from affecting the steering. No silencer is fitted to the racing model. There are not many alterations in the layout of the tourist and sports models. A small petrol injector is combined with the release valve, and an aluminium wind scoop is hinged to the top tube immediately above the sparking plug; it is easily swung out of the way should the plug require attention, and considerably assists in cooling it. The angle of the footboards has been altered on the touring model in the interests of comfort, and stops are now fitted to keep the feet in place. Leg shields are standard. The sports model has a semi-T.T. bar and footrests instead of footboards. Some of the racing models have their discs, flywheel, and tank finished in red, white, and blue.

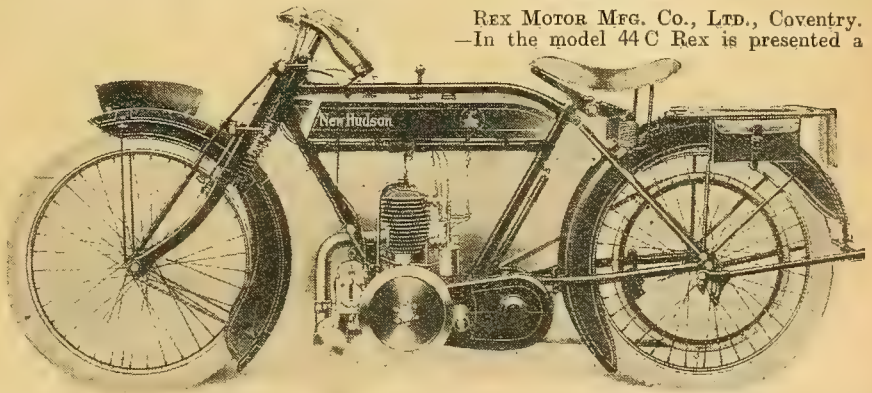


Cooling of the sparking plug is provided for on the New Hudson two-stroke by an air deflector under the tank.

REX. (84.)

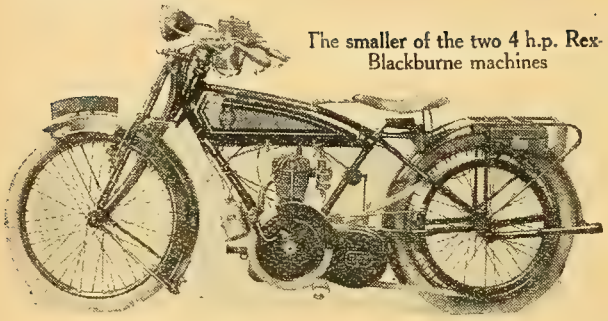
4 h.p.; 85×88 mm. (499 c.c.); single-cylinder four-stroke; side-by-side valves; hand pump lubrication; B. and B. carburetter; M-L chain-driven magneto; three-speed Sturmey-Archer gear box; chain and belt drive; 28×3in. tyres. Price £133 13s.

Rex Motor Mfg. Co., Ltd., Coventry.—In the model 44 C Rex is presented a

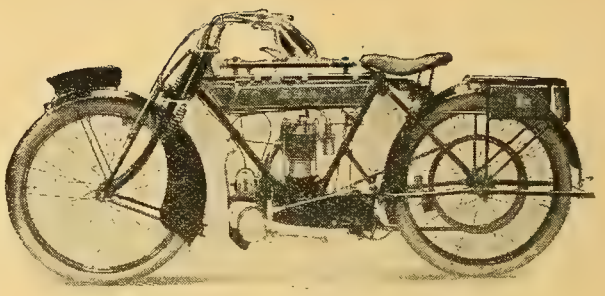


A sporting model New Hudson with semi-T.T. bars and footrests.

The Olympia Show.—

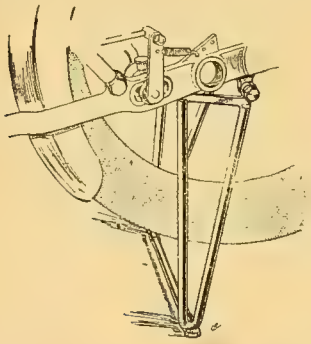


The smaller of the two 4 h.p. Rex-Blackburne machines



Chain and belt driven 2¾ h.p. single-cylinder Bradbury

dual-purpose mount of attractive appearance. With a view to its employment with a sidecar, the lugs for attachment are built into the frame, which is specially designed to give a low saddle position. The large diameter and length of the steering head is a good feature, which should be noted. Brampton spring forks are adopted as standard, and particularly good features are the strong construction of the hubs and the large size of the lubricators. Each hexagon screwed plug is plainly marked "fill with grease," so that the novice need be under no misapprehension as to the method of lubrication. Similar to this model is a lighter machine known as the model 44 L, the same engine and transmission being employed, but 26in. wheels are fitted, shod with 2½in. tyres. The tank on this model is not quite so large.

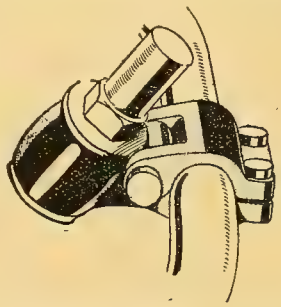


A new, light, but strong rear stand is fitted to the all-chain Rex outfit.

These two machines are very similar in appearance.

8 h.p.; 85×88 mm. (998 c.c.); twin-cylinder four-stroke; side-by-side valves; hand pump and drip feed lubrication; B. and B. carburetter; M-L chain-driven magneto; three-speed Sturmey-Archer gear; chain drive; 28×3in. tyres. Price £185 18s.

There is also an 8 h.p. machine known as model 55 CD, and constructed purely for sidecar use. Again the Blackburne engine is employed. Transmission is by roller chain throughout, the final drive being semi-enclosed, with a cushioning device incorporated in the rear sprocket. On this model a Ferodo-lined contracting band brake of large diameter is incorporated in the rear wheel, and interchangeable and detachable wheels are fitted as standard. Engine lubrication is by hand pump and suction feed, so that the regular supply can be supplemented when desired. This model may also be obtained with chain and belt transmission, when it is known as model 55 BD.

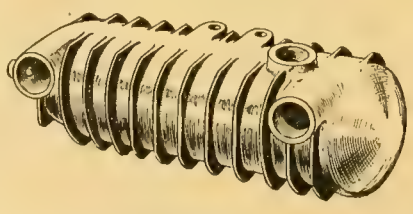


Details of the Rex adjustable handle-bar.

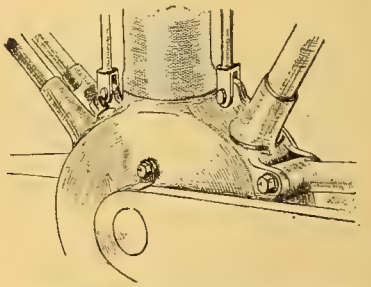
BRADBURY. (60.)

6 h.p.; 74.5×86 mm. (750 c.c.); twin-cylinder four-stroke; side-by-side valves; hand pump lubrication; B. and B. carburetter; C.A.V. chain-driven magneto; three-speed Bradbury gear; chain and belt drive; 650×65 mm. tyres.

BRADBURY AND CO., LTD., Wellington Works, Oldham.—Bradbury machines have for many years attained a name in the world of motor cycle manufacture, especially where a mount having at once great strength and proved reliability is required. Naturally, the 6 h.p. sidecar machine is the principal feature on the stand, because it represents sound and well-tried practice in sidecar outfits, and is essentially made to stand up to the exigencies of everyday hard work. Great strength is apparent, not at the expense of accessibility nor by the introduction of numerous additional tubes or stays, but by sheer merit of sound design and ample proportion. The engine has detachable heads, each held down by a single bridge and two long bolts, so that decarbonising is easy and takes little time. Both valves are at the side, and operated by disc-ended tappets offset to avoid pits being formed by the hammer of the valve stems, while a sturdy cast aluminium silencer is bolted beneath the frame and heavily ribbed to provide additional cooling surface. Light chain guards protect the drive to the driven sprocket, within which the expanding brake is housed. It is the sidecar suspension, however, that is one of the principal features, for beside the twin semi-elliptics for the third wheel, inverted semi-elliptics are interposed between the body and the frame, while coil springs are used at the front.



Radiating fins are provided on the large cast aluminium silencer of the 6 h.p. Bradbury.



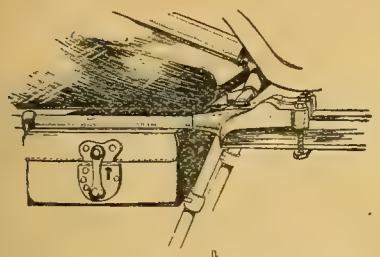
On the Bradbury the frame lugs are cast in one with the crank-case.

2¾ h.p.; 74.5×80 mm. (349 c.c.); single-cylinder four-stroke; side-by-side valves; hand pump lubrication; B. and B. carburetter; chain-driven magneto; three-speed Bradbury gear; chain and belt drive; 26×2¼in. tyres.

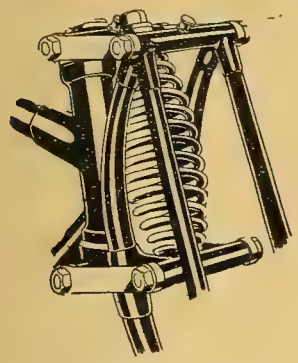
4 h.p.; 89×89 mm. (554 c.c.); single-cylinder four-stroke; side-by-side valves; drip feed lubrication; B. and B. carburetter; chain-driven magneto; three-speed gear; chain drive; 26×2½in. tyres.

Beside the twin a 4 h.p. single-cylinder engined sidecar model on similar lines is shown, the exception being that the head of the cylinder is not detachable. A 2¾ h.p. model also is a single-cylinder, but the design is similar to the twin, to the cylinders of which the single-cylinder of this model bears a close resemblance. Apart from the cylinder, however, the fact that the crank case is an integral part of the frame, and bears lugs for the two down tubes as well as the single seat-pillar, provides sufficient distinction. Both sidecar machines are chain-driven, but the solo model has chain and belt.

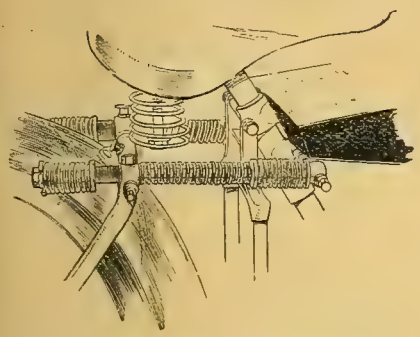
Typical Twin Sidecar Outfits.



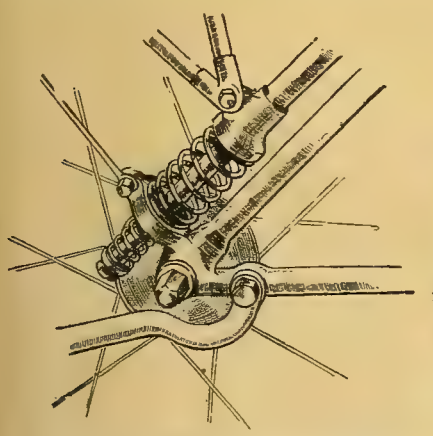
An ideal position for a tool bag—in the centre of a spring frame, as on the Raleigh.



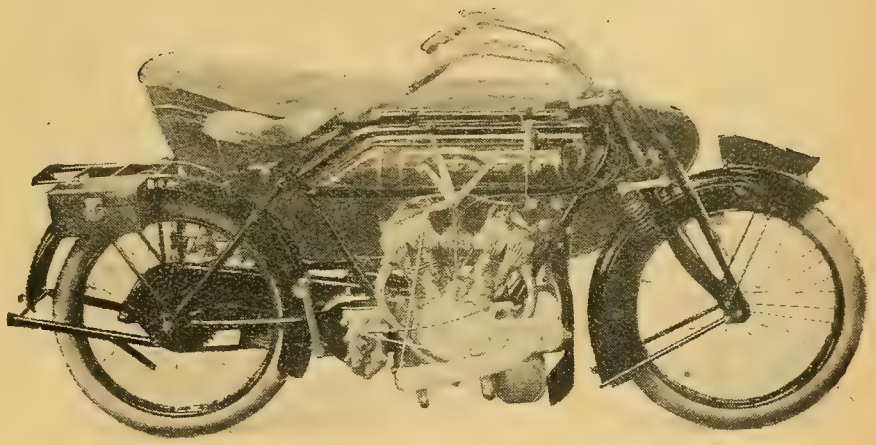
A single large spring now takes the load on the B.S.A. fork.



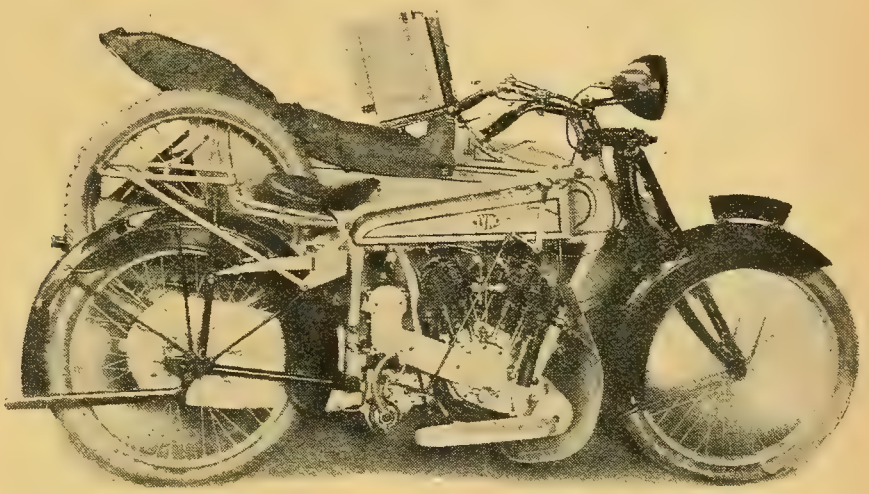
Very simple, but most efficient, is the Hobart spring frame, a detail of which is shown above.



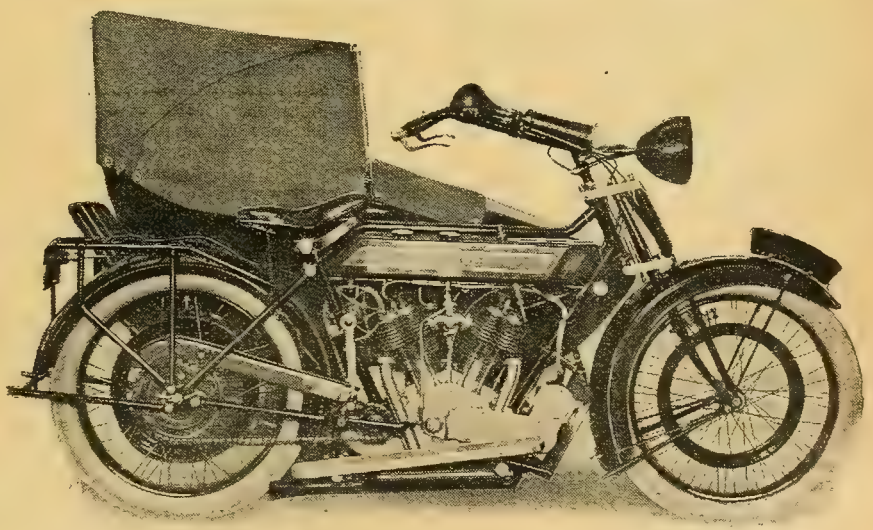
Showing the system of springing the rider and carrier on the new 4 h.p. Sheffield-Henderson.



Large radiating fins and an improved silencer are the most obvious detail alterations on the 6 h.p. Bradbury; a Grindlay sidecar is fitted.

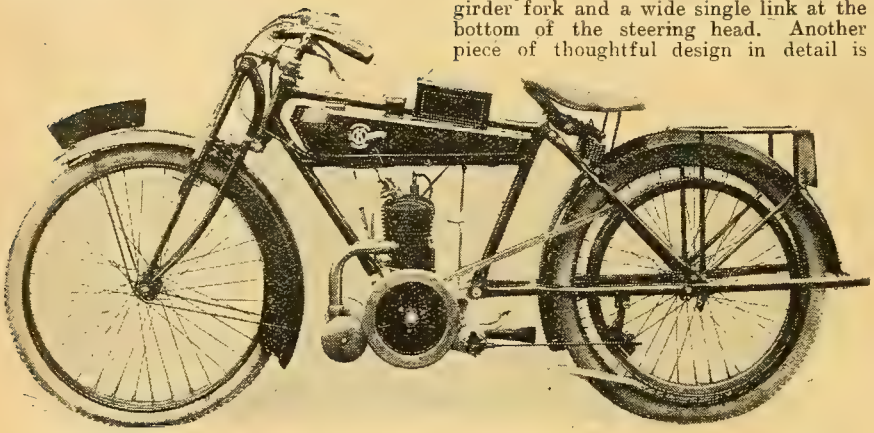


8 h.p. engine, spring frame, including spring sidecar wheel, interchangeable wheels and Magdyno, are included in the specification of the Clyno.



Valve side of the 8 h.p. Royal Enfield sidecar outfit. The side-by-side valve engine is manufactured by Vickers, Ltd.

The Olympia Show.—

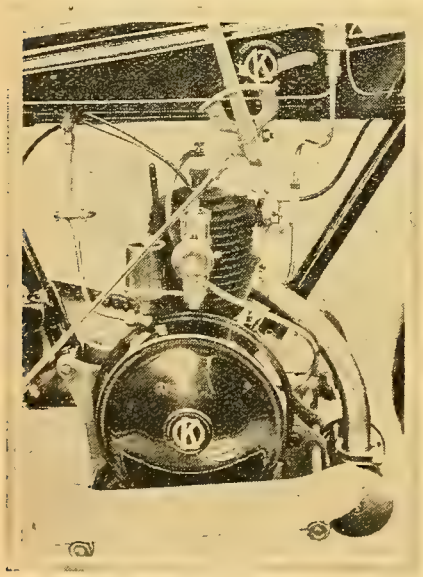


The lowest-priced lightweight at last year's Show, the O.K. Junior, improved in minor details, again attracts attention on account of its price and quality.

O.K. JUNIOR. (101.)

2¼ h.p.; 67×70 mm. (246 c.c.); single-cylinder two-stroke; drip feed lubrication; Amac carburetter; chain-driven magneto; single-speed gear; belt drive; Hutchinson 25×2in. tyres. Price £50 8s.

HUMPHRIES AND DAWES, LTD., Hall Green Works, Birmingham.—As an example of a simple machine at a really popular price, the O.K. Junior merits



The handsome flywheel cover of the O.K.-Villiers two-speed model is indicative of the general refinement of this moderately-priced mount.

close attention. The engine, which is manufactured by the O.K. people, is a very clean-looking and simple piece of work, and has such refinements as a release valve with a duct leading to the exhaust pipe and a carefully-arranged system of drip feed lubrication. Although it is offered at a very low price, the motor cycle shows evidence of careful thought in the design. The O.K. spring forks are fitted, and are very neat and simple. They are arranged with a coiled leaf spring controlling the upper end of the girder fork and a wide single link at the bottom of the steering head. Another piece of thoughtful design in detail is the petrol tank filler cap, which is raised upon the top of the tank in the form of a short tube 2in. in diameter and 2in. high, thus enabling the tank to be filled brimful without splashing. Under these conditions the tank holds 1 gallon 3 pints, which is sufficient for 140 miles or more.

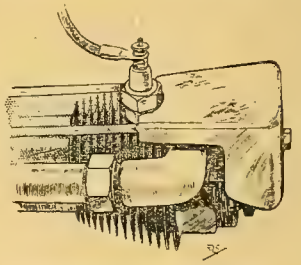
Brake pedal and front support for the foot-rests of the O.K.

Other models are made, having the well-known Villiers engine with flywheel magneto. With a plain two-speed gear the price is £59 17s.; and with Albion two-speed gear, clutch, and kick-starter, £67 4s., all of which prices are considerably below the average.

BROUGH. (64.)

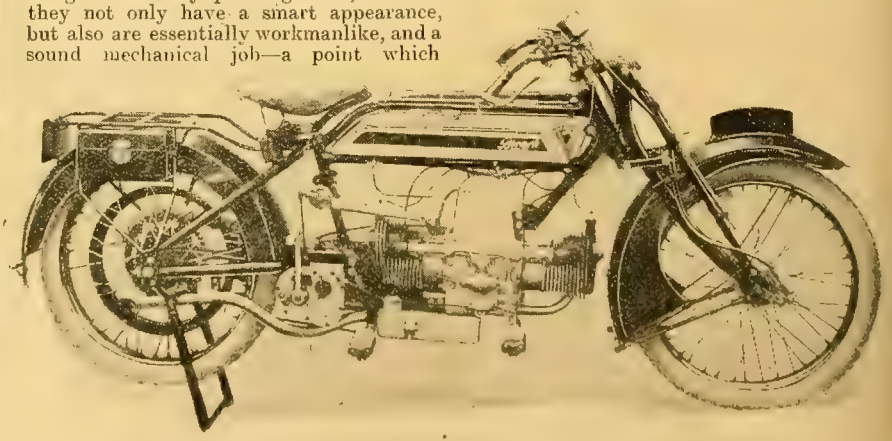
5 h.p.; 70×90 mm. (690 c.c.); twin-cylinder four-stroke; side-by-side valves; hand pump lubrication; Amac carburetter; Thomson-Bennett gear-driven magneto; three-speed Sturmey-Archer gear; chain drive; 650×65 mm. tyres.

W. E. BROUGH AND CO., Basford, Nottingham.—On the Brough stand there is the overhead valve 3½ h.p. and the large 5 h.p. model G. Both machines are designed on very pleasing lines, so that they not only have a smart appearance, but also are essentially workmanlike, and a sound mechanical job—a point which is not without considerable value in the eyes of the possible purchaser. The 5 h.p. flat twin engine has the two cylinders considerably staggered, and carried rather higher than is usual. On the 5 h.p. model there are a number of fairly thick fins, especially around the valve ports, which are placed on the upper side of the engine. The valves are above and horizontal, in which position they are accessible—the adjustment and tappet gear particularly so. From the ports short pipes are cast with the cylinders, and curve away to the main exhaust pipe below the engine. Either aluminium or steel pistons are optional, according to the work to which the purchaser desires to put the machine, but both are fitted with two piston rings at the top and a single keeper ring to secure the gudgeon pin from endwise movement. An interesting point in the design is the aluminium inlet pipe, which is secured by a C spanner nut to the valve port at the outer end, but is socketed in a special packing washer at the crank case end, allowing for differences in expansion. The second model is a modification of the well-known 3½ h.p., which differs from its larger brother, in that there are fewer fins on the cylinder head, and that the valves are in the head itself, and are operated by rocking levers and long push rods, a small aluminium cover-plate protecting the mechanism for each.



The overhead valve mechanism of the Brough is protected by a neat cover.

A part of the inlet pipe is cast in the crank case, but the mixture is conducted to the ports by a pipe constructed on the same lines as that on the 5 h.p. The engine has a bore of 70 mm. and a stroke of 64½ mm., giving a cubical capacity of 496 c.c. The remainder of the specification follows that of the 5 h.p.



The latest model 5 h.p. flat twin three-speed Brough with all-chain drive.

The Olympia Show.—

A Simplex motor attachment applied to a Wolf bicycle.

WULFRUNA. (76.)

2¾ h.p. Blackburne; 71×88 mm. (349 c.c); single-cylinder four-stroke; side-by-side valves; drip feed lubrication; Amac carburetter; C.A.V. chain-driven magneto; two-speed constant mesh gear; chain and belt drive; 26×2¼in. tyres. Price £99 15s.

Wulfruna Engineering Co. (1920), Ltd., Great Brickkiln Street, Wolverhampton. —Finished in black and gold the Wulfruna range of lightweights is attractive both in appearance and in specification. Of sound and orthodox design, the list of fittings includes Brampton forks, Blackburne engine, and Sturmey-Archer gear box. Large rubber-covered aluminium footboards are provided, and the low riding position with wide handle-bars proves very comfortable on the road. Three lightweight models are available, but the chief difference lies in the power units employed, model A having a Blackburne engine, model B a two-stroke Villiers engine (price £75), and model C the 2¾ h.p. J.A.P. engine (price £80).

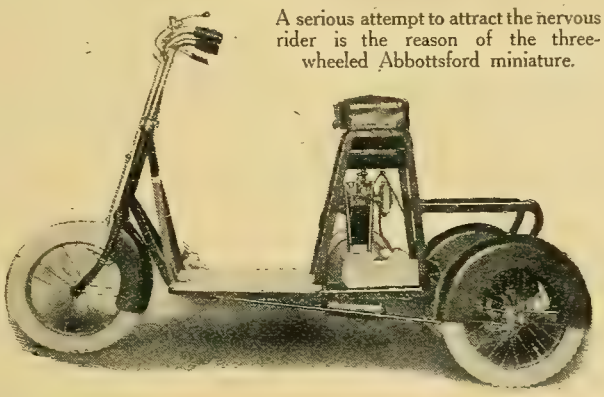
4 h.p.; 85 × 88 mm. (498 c.c.); single-cylinder four-stroke; side-by-side valves; drip feed lubrication; Amac carburetter; E.I.C. chain-driven magneto; three-speed sliding gear; chain and belt drive; 26×2½in. tyres. Price £110.

A larger model designed as a dual-purpose machine is fitted with a 4 h.p. Blackburne engine, and Sturmey-Archer three-speed gear box, although in other respects it is very similar to the lightweight models. This also may be obtained if preferred, with the 4 h.p. J.A.P. engine, in which case the price is £100.

ABBOTTSFORD. (162a.)

1½ h.p.; single-cylinder four-stroke; overhead valves; drip lubrication; single-lever carburetter; chain-driven magneto; single-speed gear; chain drive; 16×2⅜in. tyres. Price £35.

A serious attempt to attract the nervous rider is the reason of the three-wheeled Abbottsford miniature.



Abbottsford Motor Scooter and Engineering Co., Ltd., 5, Surbiton Road, Kingston-on-Thames.—This is distinctly the smallest mechanically-propelled three-wheeler in the building. Just as there is a small but steady demand for the tricycle in the pedal cycle world, so will the Abbottsford make its appeal. But beyond the question of its suitability for the nervous or elderly rider, there lies the wide field of light delivery purposes. Goods to a weight of 168 lb. may be taken on the specially constructed carrier; and we should imagine that, intelligently used, it is an ideal substitute for the boy and tradesman's carrier cycle. A cone clutch and handle starter are provided, the drive from the tiny four-stroke engine being by chain *via* a countershaft to give the necessary gear reduction. On account of a tendency to sway on corners, the laminated rear springs have been shortened. However, they are still ample for comfort at any speeds the vehicle is likely to attain.

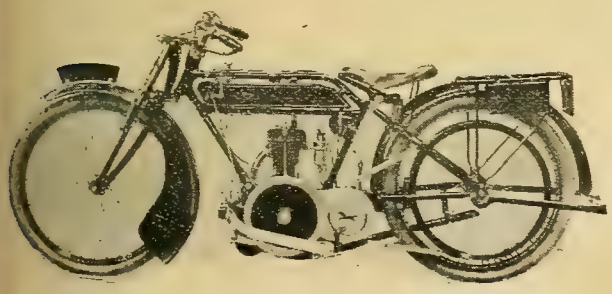
The engine is the John scooter power unit, which has a bore and stroke of 55 mm. and 60 mm. respectively, the capacity being 142.5 c.c. It has overhead valves and an outside flywheel.

DOUGLAS. (126.)

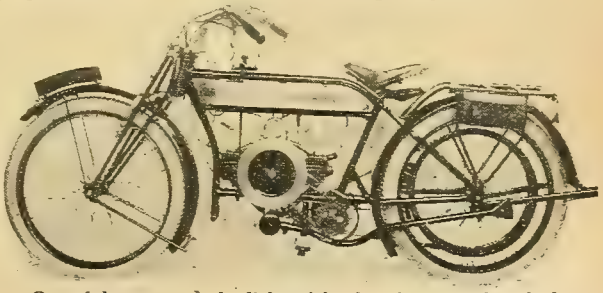
3½ h.p.; 68×68 mm. (494 c.c.); flat twin four-stroke; overhead valves; mechanical lubrication; Degory carburetter; gear-driven magneto; three-speed countershaft gear; all-chain drive; Hutchinson 650×65 mm. tyres.

Douglas Motors, Ltd., Kingswood, Bristol. — The new Douglas sporting engine has already been described in our columns. Only in its main lines does it follow existing Douglas practice. The valve gear is quite new. Both cylinder heads are detachable, and, above the valve rocker bearings (which form part of the casting), there is a small ribbed aluminium chamber, which is filled with oil about every thousand miles, and lubricates the valve rockers by a wick feed. Engine lubrication is also new: a worm-driven pump on the top of the crank case draws oil from the tank and forces it through a sight feed to two pipes which lead into the base of each cylinder. In addition to this, a hand pump is provided by which charges of fresh cool oil can be applied just above the moving cranks in case of necessity. A new front brake is also fitted, which takes the form of a bevel edge disc of about 6in. diameter on the hub, with a parallel motion V grooved shoe embracing about one-third of its circumference. Altogether, it is a most interesting machine.

Another model, with the same innovations, has an engine of 350 c.c. capacity, the bore and stroke being the same as the standard 2¾ h.p. engine.

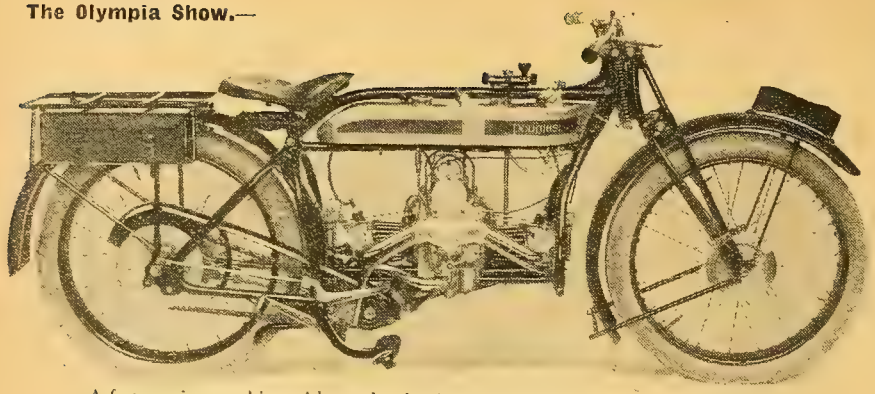


The Blackburne engined 2¾ h.p. Wolf chain and belt-driven model.



One of the most popular lightweights in existence. A revised model of the 2¾ h.p. W.D. Douglas is exhibited and sells at a moderate price.

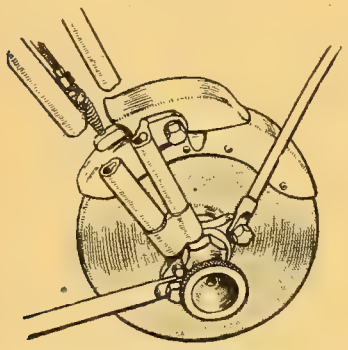
The Olympia Show.—



A fast touring machine with overhead valves and all-chain drive. Much interest centres round the new 3½ h.p. Douglas.

4 h.p.; 74.5×68 mm. (595 c.c.); flat twin; side-by-side valves; chain and belt drive. Price £130; with sidecar £170.

The 4 h.p. Douglas remains practically unaltered, for the experience gained



An unusual brake block is a feature of the Douglas front wheel brake.

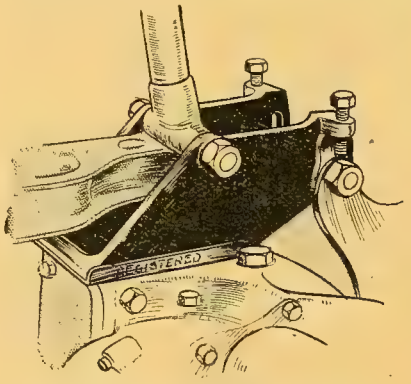
during the war under extremely unfavourable conditions has made the machine entirely satisfactory in its present form. Details of the 2¾ h.p. Douglas are so well known that they need not be repeated here. Besides supplying the three-speed kick-starter model, which is priced at £105, the makers are listing an improved W.D. model with plain two-speed gear at £85.

OLYMPIC. (32.)

2¾ h.p. Orbit; 68×72 mm. (264.5 c.c.); single-cylinder two-stroke; drip feed lubrication; Amac carburetter; chain-driven magneto; single-speed gear; belt drive; 26×2½in. tyres. Price £65.

2¾ h.p.; 68×72 mm. (264.5 c.c.); single-cylinder two-stroke; drip feed lubrication; Amac carburetter; chain-driven magneto; three and reverse, or four-speed Jukes constant mesh gear; chain and belt drive; 26×2½in. tyres. Price £84.

Olympic Cycle and Motor Co., Ltd., Granville Street, Wolverhampton.—This exhibit comprises single gear and multi-speed lightweights fitted with the Orbit engine. The most interesting item of the specification is the swinging bracket on which the gear box is mounted in the multi-speed models. The bracket swings on a pivot pin; its arc of travel is adjusted by two set screws locked by four nuts, so that the chain tension can be set to very fine limits without any possibility of disturbing the alignment. Any make of gear box can be fitted to this bracket, and the requisite variations of chain or belt line are easily made with the aid of an adapter boss for the flywheel. Actually the gear box fitted to the Show machine



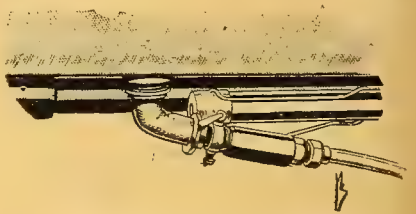
The gear box on the Olympic may be swung to the rear by unscrewing the two set screws on the right, thus easily tightening the primary drive.

is a Jukes four-speed with gate change; the gears are in constant mesh; the lever is self-centring, and is made of two parts bolted together so that the position of the lever can be adapted to suit the rider's taste. It is intended to fit a three-speed and reverse box to a new model with four-stroke engine for sidecar work, which is in course of preparation. The multi-speed model weighs 195 lb. fully equipped for the road, and inclusive of a kick-starter and clutch. The single gear model weighs only 146 lb. All the frame tubes are straight; every nut and pin on the machine is spring-washered; the mudguards are very wide, and the flywheel is enclosed in an aluminium casing. A Swan spring fork is fitted, which is worth examination, as its suspension is obtained by two helical springs enclosed in a telescopic case which is filled with grease and is air-tight, so that a certain pneumatic action is obtained.

WOOLER. (33.)

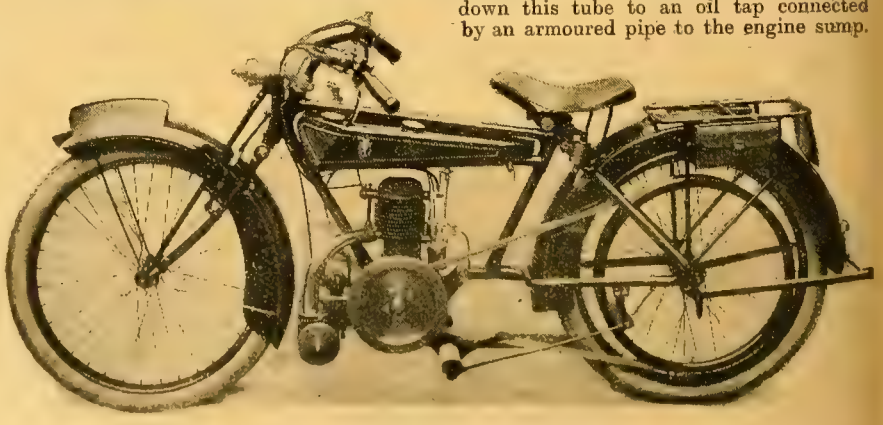
2¾ h.p.; 60.5×60 mm. (349 c.c.); twin-cylinder four-stroke; side exhaust, overhead inlet valves; mechanical lubrication; Amac carburetter, B. and B. (touring); gear-driven magneto; variable speed expanding pulley gear; belt drive; 26×2½in. tyres. Price £102 semi-T.T.; £107 10s. touring; £112 Brooklands.

Wooler Motor Cycle Co. (1919), Ltd., Alfreton.—The Wooler exhibit comprises



Just below the petrol tap on the Wooler there is a simple filter,

four models, namely, the standard touring model, which is practically identical with the successful machines of 1920, semi-T.T. (belt-driven), a Brooklands model (belt-driven), and the completely new Colonial model described below, which has a three-speed gear box and single chain drive. The main improvements in the three belt-driven models include a slight alteration in the inlet valve domes, which makes it easier to get at the valve cotters. An ingenious crank case release is provided through a hole drilled in the magneto driving gears. The outlet is connected by a rubber pipe to a hole in the middle tube of the middle saddle tube. Released vapour travels down this tube to an oil tap connected by an armoured pipe to the engine sump.



A simple single-speed lightweight—the Olympic.

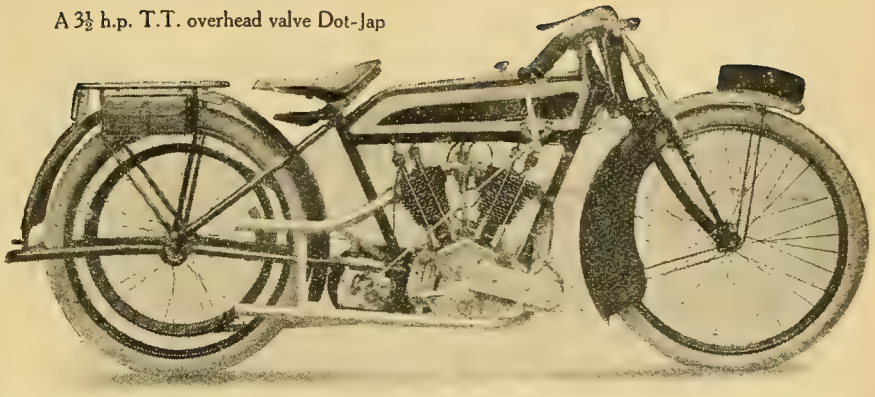
The Olympia Show.—

The lamp and generator are mounted on a neat fitting which raises them a little, and the rays from the air vents in the base of the head lamp illuminate the speedometer, which is mounted in a circular clip on the left-hand side of the fork crown. The horizontally-opposed twin-cylinder engine and variable pulley gear remain as before, a drop of 100% in the ratio being available. The special Brooklands model is supplied under a speed certificate of not less than fifty-five miles per hour. The belt-driven models weigh 168 lb. The machine is designed with a special eye to economy and accessibility, the makers claiming that the average cost of oil, petrol, tyres, and belt for the first year does not exceed ¾d. per mile.

A new Colonial model has a three-speed gear box housed in the sump and running in oil. A disc clutch is combined with the gear box, and is hand-controlled. On this model a thrower disc on the engine-shaft is substituted for the chain lubrication employed on the belt-driven models. The single chain to the rear wheel is adjusted by sliding the power unit bodily on the two tubes composing the engine cradle. This adjustment is locked by two bolts, and the exhaust pipe and box slide with the engine. A spare chain is carried in a light aluminium drum attached by a single control bolt to the base of the sump. The weight of this machine is 190 lb., and gear ratios provided are 4¾, 7½, and 15½ to 1 respectively.

Adjustable handle-bars are standard on the Woolers at Olympia.

A 3½ h.p. T.T. overhead valve Dot-Jap



DOT. (28.)

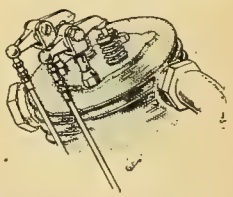
3½ h.p.; 70×64 mm. (492 c.c.); twin-cylinder four-stroke; side-by-side valves; drip feed lubrication; Amac carburetter; E.I.C. chain-driven magneto; two-speed Albion gear; chain and belt drive; Hutchinson 26×2¼in. tyres. Price £120.

DOT MOTORS, Ellesmere Street, Hulme, Manchester.—This is an entirely new model, clearly designed for the sporting solo rider. In bringing down the weight to 196 lb., Mr. Harry Reed deserves to be very warmly congratulated. Although the machine is of low build, and possesses ample crank case clearance, the cylinders may easily be removed without dismounting the engine, and, although light in weight, it is equipped with all refinements, including a two-speed gear box incorporating a clutch and kick-starter. Consequently it is suitable not only for use in this country but for the Overseas soloist as well.

An even more sporting model than that just described is provided with footrests instead of footboards, and the attractive overhead valve 348 c.c. J.A.P. engine, which is dear to the heart of the speed man. Curiously enough, it weighs just 1 lb. more than the model just described. A similar machine is shown equipped in exactly the same way as the 196 lb. model, except for the fitting of a 2¾ h.p. single-cylinder J.A.P. engine.

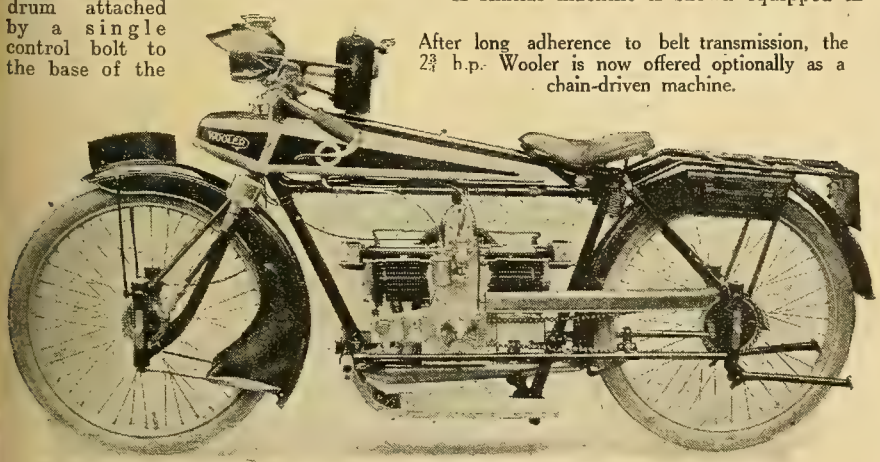
8 h.p.; 85.5×85 mm. (976 c.c.); twin-cylinder four-stroke; side-by-side valves; drip feed lubrication; Amac carburetter; E.I.C. chain-driven magneto; three-speed Sturmey-Archer gear; all-chain drive; Hutchinson 28×3in. tyres. Price £200 with sidecar.

This well-known sidecar model is fitted with the best components, such as the 8 h.p. J.A.P. engine, Sturmey-Archer gear box, including clutch and kick-starter. It is an attractive proposition. The gear box is provided with an adjusting screw, which is an indispensable feature, greatly facilitating the tensioning of the front chain. The back wheel is provided with a knock-out spindle, and is consequently easily adjustable, but the wheels are not interchangeable. Mr Reed is a man who has thoroughly studied Continental requirements. Not only is the new lightweight twin specially suitable for Continental work, but the sidecar shown is fitted with interchangeable connections, so that it can be fitted on either side of the machine.



Overhead valve gear of the 3½ h.p. twin J.A.P. engine of the Dot

After long adherence to belt transmission, the 2¾ h.p. Wooler is now offered optionally as a chain-driven machine.

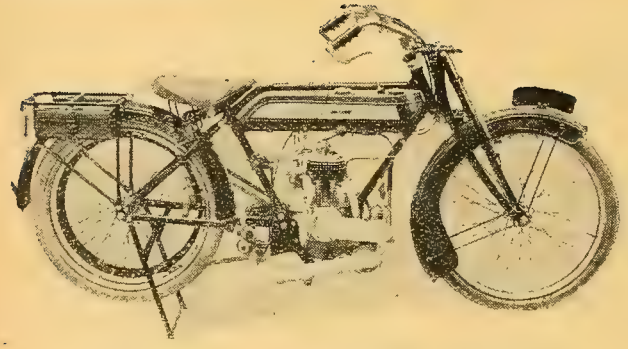


MOHAWK. (131.)

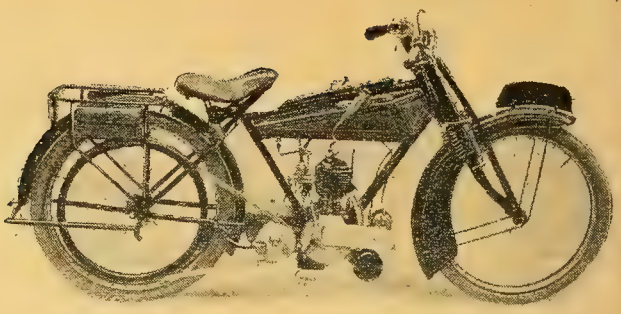
4 h.p. King Dick; 85×88 mm. (499 c.c.); single-cylinder four-stroke; side-by-side valves; hand pump lubrication; B. and B. carburetter; chain-driven magneto; three-speed Sturmey-Archer gear; chain and belt drive; Dunlop 26×2½in. tyres.

MOHAWK CYCLE CO., LTD., Alexandra Road, Hornsey, N.8.—Each year sees the number of purely pedal cycle firms at Olympia dwindling away—not because they are going out of business, but because they recognise that all their cycle customers are also potential motor cyclists, and that, when the satisfied owner of a pedal cycle contemplates donning goggles, his first thoughts will turn

The Olympia Show.—



The Mohawk is an attractive mediumweight with a 2¾ h.p. J.A.P. engine.



A neatly designed solo mount is the 2¾ h.p. two-speed Diamond-Jap.

to the makers of his present cycle. Last year the makers of the Mohawk cycle exhibited one lightweight, but production difficulties prevented anything in the nature of a serious output. This year, however, they are entering wholeheartedly into the mechanically-propelled side of the industry, and already they have plant going on with the production of their new range of models. The machine specified above is intended for dual-purpose work, and, beyond the excellence of the specification and an unusually strong frame, there is little to comment upon.

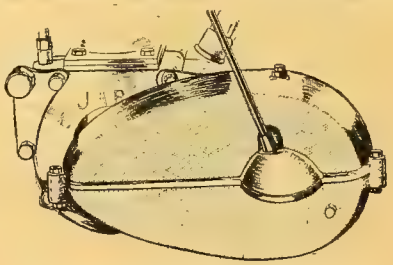
2½ h.p. Villiers; 70×70 mm. (269 c.c.); single-cylinder two-stroke; drip feed lubrication; Amac carburetter; flywheel magneto; two-speed Sturmey-Archer gear; chain and belt drive; Dunlop 26×2¼in. tyres.

There are three conventional lightweights on this stand: (1) As above; (2) as above, but single-geared; and (3) with a 2¾ h.p. J.A.P. engine—but possibly greatest interest centres round the Economic cycle attachment. This is of American origin, but is shown attached to a specially strengthened British-built Mohawk cycle. The engine is an air-cooled flat twin two-stroke of 154 c.c., which carries its ignition *and lighting* generator in the flywheel. A chain takes the drive to the rear wheel through a most ingenious and simple cush drive. Coil springs form a triangle with apexes attached to the cycle rim. The chain sprocket drives to the centre of these springs.

DIAMOND. (98.)

2½ h.p.; 70×76 mm. (293 c.c.); single-cylinder four-stroke; side-by-side valves; drip feed lubrication; Amac carburetter; C.A.V. chain-driven magneto; two-speed Enfield gear; chain and belt drive; Dunlop 26×2½in. tyres. Price £84.

D.F. AND M. ENGINEERING CO., LTD., Diamond Works, Wolverhampton.—Amongst the firms who distinguished themselves just prior to the Show by setting up new records at Brooklands are the D.F. and M. Engineering Co., whose beautifully finished little J.A.P.-engined lightweight forms a centre of attraction. Model E embodies a J.A.P. engine and Enfield two-speed gear, yet, though the specification appears ordinary, there are many little details which distinguish the Diamond range from the average machine. A simple frame construction with straight sloping top tube gives a pleasing appearance, and duplex front down tubes are a well-known Diamond feature. These tubes are detachable, as also is the lower tank rail on which the tank is supported. A most ingenious feature is the method of fixing the Enfield countershaft gear. The gear is carried in an aluminium casting, which bolts up to a bracket suitable also for a standard countershaft gear. Both primary chains and the selective clutches are entirely enclosed in an aluminium



A neat casing encloses the Enfield two-speed gear and driving chains on the Diamond.

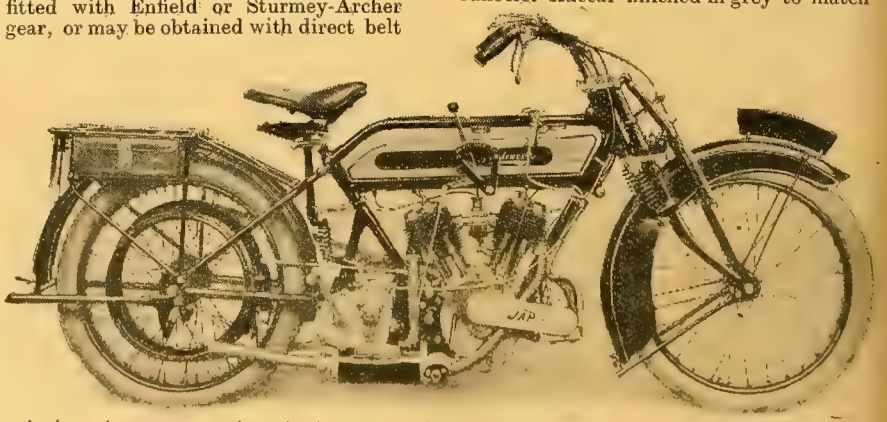
case, the top half of which is easily detachable, though great care has been taken to render the joint oil-tight. A simple heel brake and excellent mudguards complete the specification. The same machine can be obtained with Sturmey-Archer two-speed gear. Price so fitted is £89 10s. Three other similar mounts are staged, fitted with Villiers flywheel magneto engine; these are also fitted with Enfield or Sturmey-Archer gear, or may be obtained with direct belt drive at the figure of £61 19s. 168 lb. is the weight of the heaviest machine made by the firm.

HAZLEWOOD. (96.)

8 h.p. J.A.P.; 85.5×85 mm. (976 c.c.); V twin-cylinder four-stroke; side-by-side valves; drip feed lubrication; B. and B. carburetter; M-L chain-driven magneto; three-speed countershaft gear; all-chain drive; Dunlop 28×3in. tyres. Price with sidecar £210.

HAZLEWOOD, LTD., West Orchard, Coventry.—A reputation for sturdy construction has been a Hazlewood characteristic for some years past, and the new 8 h.p. machine will do nothing to detract from this. A newcomer to the ranks of the 8 h.p. sidecar outfits is always a matter of interest, and the latest Hazlewood is a fine example of British construction.

The 8 h.p. J.A.P. engine which provides the power is coupled to a three-speed countershaft gear of the company's own construction, the multiple-plate dry clutch being operated by a pedal. A cast aluminium cover protects the primary chain, and the top run of the rear chain is covered by a well valanced guard. Outstanding features of the machine are the straight top tube concealed by a neat saddle tank, a large diameter drum brake on the rear wheel, a large cast aluminium silencer, and a simple but effective form of auxiliary saddle suspension. Mudguarding is well carried out, and the Druid type forks are of the latest pattern, including the compensated spring action. This machine is attached to a handsome Canoelet sidecar finished in grey to match

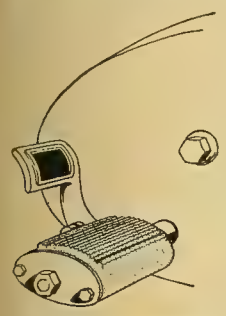


An imposing appearance is noticeable on the 6 h.p. Hazlewood. Observe the saddle suspension.

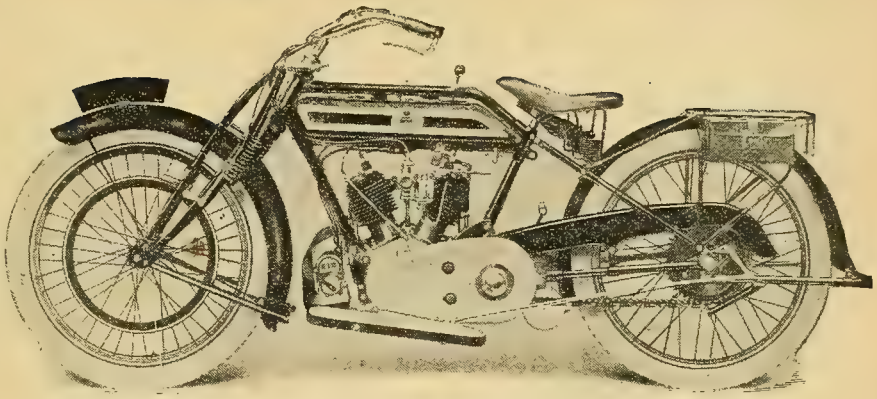
The Olympia Show.—

the tank, and the Hazlewood speciality of front lug reinforcement is, of course, included. The same machine may be obtained with final belt drive.

A 6 h.p. model is shown also fitted with a J.A.P. engine; it is similar to the machine described above, but has a dropped top tube and chain and belt drive. The price, complete with a rather lighter sidecar, is £186. The 6 h.p. machine is also shown as a solo mount with handle-bar controlled clutch and footrests instead of footboards; price £160. A gear box is shown in section, from which the spring tooth construction of the kick-starter is clearly visible.



Sturdy and conveniently placed brake-pedal on the solo Hazlewood.

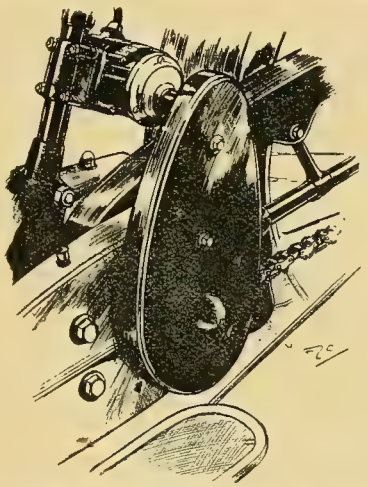


A mediumweight twin which is popular for solo as well as sidecar work. Note the rear brake of the internal expanding variety.

ROVER. (89.)

3½ h.p.; 85×88 mm. (499 c.c.); single-cylinder four-stroke; side-by-side valves; hand pump lubrication; B. and B. carburetter; E.I.C. chain-driven magneto; three-speed countershaft gear; chain drive; 650×65 mm. tyres.

THE NEW ROVER CYCLE CO., LTD., Coventry.—The Rover has always been immensely popular, and has gained a name for quiet and smooth running equalled by few single-cylinder machines. Minor alterations and detail improvements have been carried out, and all-chain drive is now standardised. A neat aluminium case encloses the first step, while the final drive has a guard on the upper portion only. A point about the Rover has always been the compact build; and a particularly comfortable riding position, including a low saddle, is an excellent feature. Large domed guards are fitted, and the foot brake is an internal expanding mechanism in a drum incorporated with the rear sprocket. It is operated by a pedal conveniently placed on the left side of the machine, the pedal on the right side operating the clutch. The front brake is notable for its simplicity, and consists of a fibre shoe operating in a dummy belt rim. This model may also be obtained single-geared with belt drive, or fitted with a Philipson pulley. A specially fast sporting machine is made.



On the 5-6 h.p. Rover a Lucas dynamo (fitted on the down tube) is driven by an enclosed chain from the countershaft. Cast aluminium footplates are fitted to the new model.

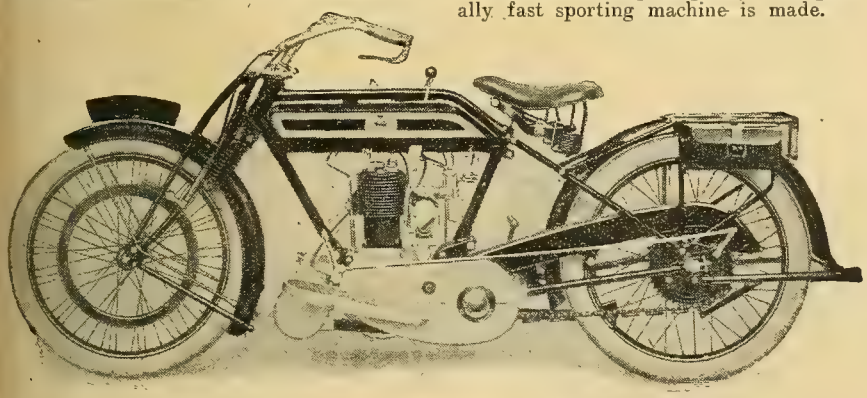
5-6 h.p.; 70×85 mm. (654 c.c.); twin-cylinder four-stroke; side-by-side valves; hand pump lubrication; Amac carburetter; E.I.C. chain-driven magneto; three-speed countershaft gear; chain drive; 28×3in. tyres.

A dual-purpose mount, which is popular with both solo riders and sidecarists alike, is the 5-6 h.p. Rover, fitted with a J.A.P. engine. In the general layout this machine is, however, similar to the single-cylindered Rover, though rather longer in the wheelbase. Transmission and brake are identical with those of the single-cylindered model, and large comfortable footboards are provided. An excellent finish characterises the Rover products, and the provision of larger wheels on this model is a feature which commends itself to many riders, and should result in enhanced comfort on the road.

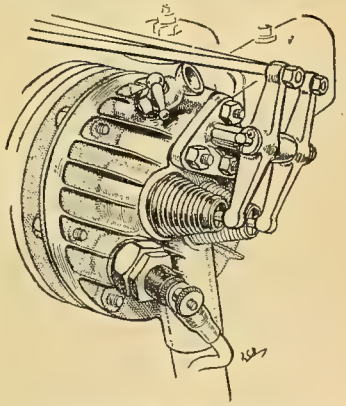
SKOOTAMOTA. (142.)

1½ h.p.; 60×44 mm. (125 c.c.); single-cylinder four-stroke; overhead valves; hand pump lubrication; single lever carburetter; C.A.V. gear-driven magneto; single-speed; enclosed chain drive; Wood-Milne 16×2⅜in. tyres.

GILBERT CAMPLING, LTD., 1, Albemarle Street, Piccadilly, W.1. — A plated machine reposing on a mirror forms a

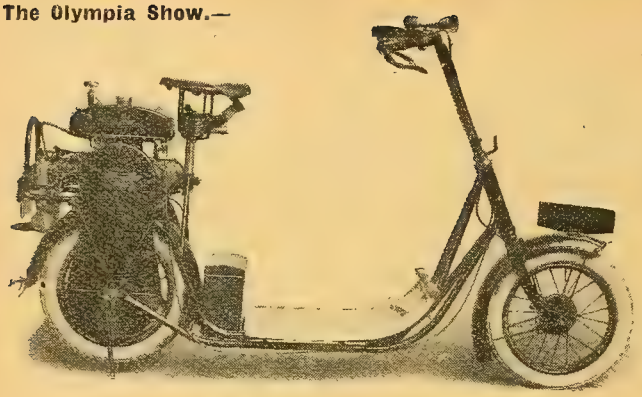


With clean lines and sturdy appearance, the 3½ h.p. Rover is a typical example of a British dual-purpose mount.

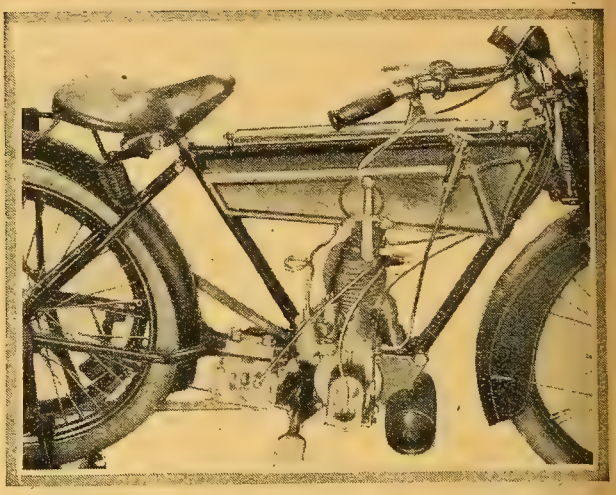


Detachable cylinder head and overhead valves operated by push rods on the 1½ h.p. Skootamota engine.

The Olympia Show.—



Small wheels, an entirely open frame, and a high efficiency engine, are features which attract so many to the Skootamota exhibit.



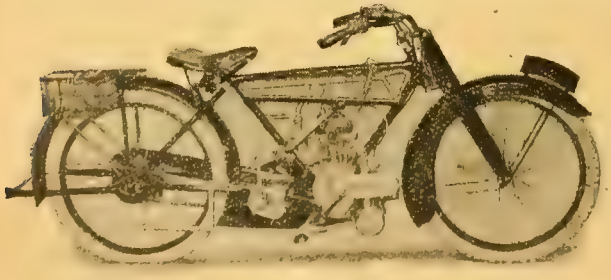
The simple two-stroke Beaumont two-speed mount A Wall engine is fitted in this case.

dazzling centre of attraction here. All the models shown have open frames and seats, and are provided with large size footboards which should assist greatly in shielding off dirt and dust. Even the scooter has been developed in divers ways in accordance with modern dictates. For instance, one model has plated disc wheel covers, whilst another specimen, which will appeal to ladies, is provided with a wicker basket on the handle-bars; another has a case neatly mounted on the three-ply wood footboards, whilst a further type is intended for express parcels delivery. The scooter sidecar alone remains as a possibility of the future! With a single-cylinder air-cooled engine disposed horizontally, and the petrol and oil tank mounted over it, the whole of the mechanism is actually astern of the rider. A guard is provided as protection for the roller chain—adjustable for tension—which transmits the drive from a sprocket on the camshaft to the rear wheel.

BEAUMONT. (163.)

2¾ h.p. Blackburne; 71×88 mm. (348 c.c.); single-cylinder four-stroke; side-by-side valves; drip feed lubrication; B. and B. carburetter; Ranbaken chain-driven magneto; two-speed Sturmey-Archer gear; chain drive; Kempshall 26×2¼in. tyres. Price £99 10s.

BEAUMONT MOTORS (LEEDS), LTD., Cleopatra Works, Harehills, Leeds.—There is a clean neatness about this all-chain drive lightweight that is very commendable. Detail, both in design and finish, is of a high standard, and, although the power-unit and gear box are proprietary units, the machine is in many ways distinctive. Both the handle-bar and pedal brakes actuate bands respectively internally expanding and externally contracting on a drum on the rear hub. The foot brake rod is of the (literally) straight pull type; and the pedal portion is long enough to afford great leverage. Arden spring forks and a wide flat tank, shallowing to the rear, are two noticeable features; while the width and more especially the extent around the circumference of the wheel of both front and rear mudguards are unusually great.



The lightweight 2¾ h.p. Beaumont is chain-driven. Observe the girder type spring forks.

2¾ h.p. Wall; 70×70 mm. (269 c.c.); single-cylinder two-stroke; Amac carburetter; direct-driven magneto; two-speed Roc gear; chain and belt drive; Kempshall 26×2¼in. tyres. Price £68 5s.

This model has been produced on simpler and cheaper lines, but at the same time it compares very favourably with any other exhibit of its type. In appearance rather similar to the other model, it lacks that touch of "luxury" that lies in the specification of its stable companion. No clutch or kick-starter is fitted, the final drive being by belt from a Roc two-speed gear box.

NEW SCALE. (130.)

4 h.p. Blackburne; 85×88 mm. (499 c.c.); single-cylinder four-stroke; side-by-side valves; drip feed lubrication; Amac carburetter; B.T.H. chain-driven magneto; three-speed Sturmey-Archer gear; chain and belt drive; Avon 26×2½in. tyres. Price £126.

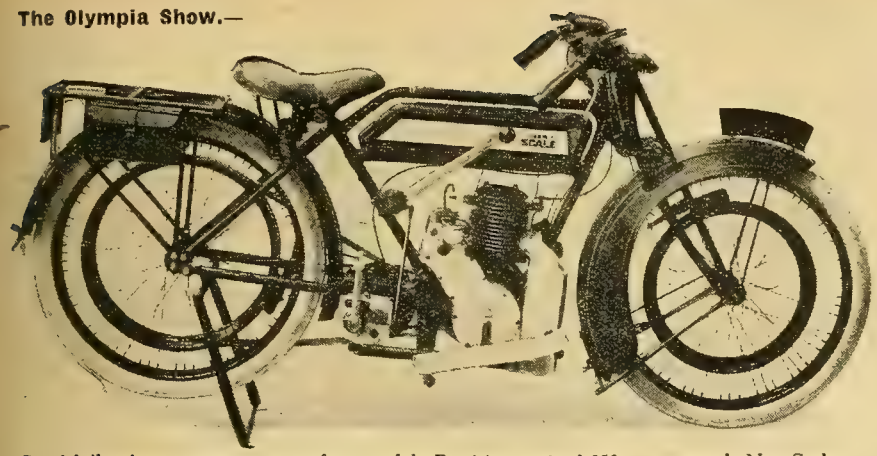
ROBERTS AND HIBBS, LTD., Bank Street, Droylsden, Manchester.—Manchester appears to have a distinct leaning towards startling colours for its motor cycle products. The recently introduced New Scale follows the lead of other factories in the same locality by adopting a vivid crimson colour scheme—with, however, a silver-grey panel on the tank which tones down the general effect very nicely. There is, however, a noticeable absence of unnecessary plating, and, combined with a simple, smooth outline, this machine should be very easy to keep in its original state of pristine brightness. Mudguarding, too, is very adequate. Although the New Scale embodies a very common combination of component parts—Blackburne engine, Sturmey-Archer gear box, etc.—it is quite a distinctive little machine. The amply proportioned dummy belt rim front brake, the neat clip-up front stand, and the inclusion of Brampton Biflex forks in the specification are indicative of the thoroughness of the design. With sidecar, the outfit sells at £160.

How a large silencer may be inconspicuously carried on a two-stroke is shown by this vertical expansion box on the New Scale.

3 h.p. Precision; 74×81 mm. (350 c.c.); single-cylinder two-stroke; sump lubrication; Amac carburetter; B.T.H. chain-driven magneto; three-speed Sturmey-Archer gear; chain and belt drive; Avon 26×2¼in. tyres. Price £94 10s.

The 350 c.c. Precision two-stroke power unit is an engine that possesses quite a considerable reserve of power when used in a solo lightweight. The natural sequence, therefore, is—attach a sidecar! This probability has been anticipated by Messrs. Roberts and Hibbs. They turn out their lightweight either suitable for sidecar work or actually as a sidecar outfit. Chances of strained frames and similar mishaps are obviously reduced by

The Olympia Show.—



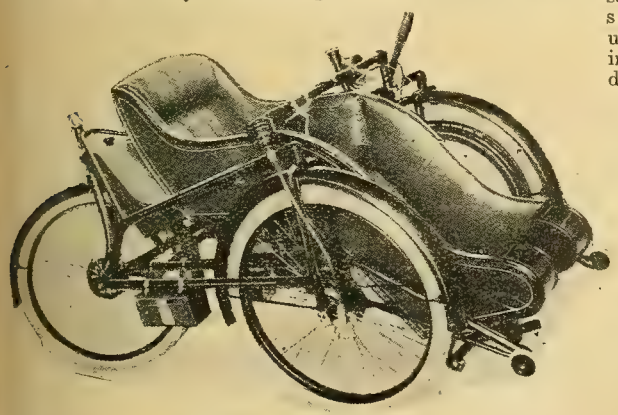
Special silencing arrangements are a feature of the Precision-engined 350 c.c. two-stroke New Scale.

this plan; and, in this case—a very important point—the usefulness of the machine for purely solo work is entirely unaffected. It remains light, low, and economical. Regarding details, there is little to note that has not been said before about the various well-known components utilised. A point, however, about the Precision sump system of lubrication is that, carrying oil in the engine, it allows a large capacity petrol tank to contain fuel only. On this machine an extremely large vertical silencer runs parallel with the cylinder.

DAYTON. (48.)

1½ h.p.; 57×63.5 mm. (161 c.c.); single-cylinder two-stroke; hand pump lubrication; Amac carburetter; Fellowes chain-driven magneto; single-speed gear; chain and belt drive; 25×2in. tyres.

THE CHARLES DAYTON MFG. CO., 221, High Street, Shoreditch, London.—In view of the number of men who are permanent invalids as a result of the war, it is interesting to see that the Dayton motor bath chair is now on the market as a production model after its initial essay last year. A small two-stroke engine is placed at the rear of the frame and drives a countershaft by a chain, the countershaft containing a clutch. From the countershaft the belt is taken to a rim on the near side front wheel, which is the only one through which power is transmitted. There is a free-wheel sprocket connected by a chain to a long lever on the left of the driver who can, by this means, easily start the engine. The single rear wheel steers, being connected to a tiller, on which also is the single throttle lever, the decompressor control, and the clutch control. One brake acts on a front wheel, the other on the rear wheel, both being contracting bands. On the all-weather model the footboards are closed in, and a Cape hood can be fitted, but on the second model separate small footplates are used, and can be set in one of several different positions.

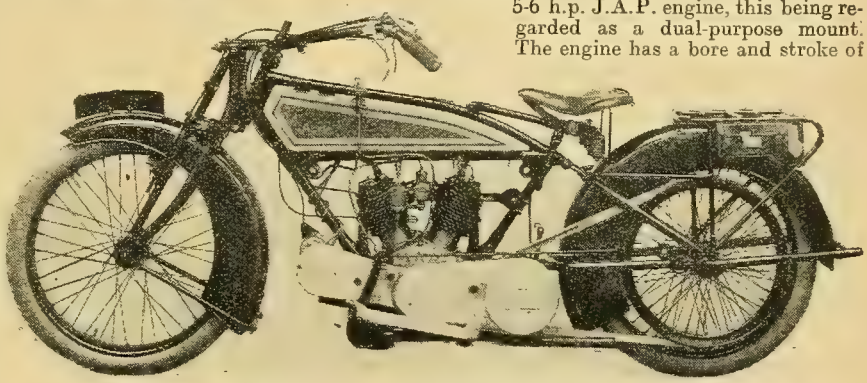


The Dayton invalid's motor tricycle has tiller steering and is driven by belt to the near side front wheel.

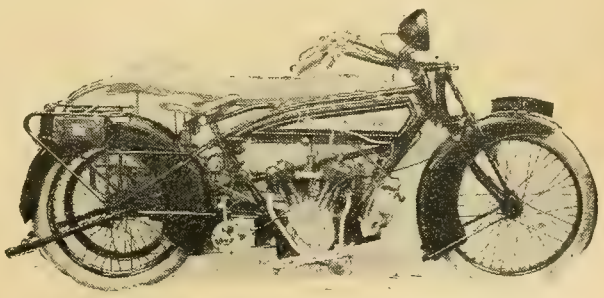
COVENTRY ACME. (85.)

8 h.p.; 85.5×85 mm. (976 c.c.); twin-cylinder four-stroke; side-by-side valves; pump and drip feed lubrication; B. and B. carburetter; M-L chain-driven magneto; three-speed Sturmey-Archer gear; chain and belt drive; 28×3in. tyres. Price with sidecar £213 15s.

COVENTRY ACME MOTOR CO., LTD., Earlsdon, Coventry.—Designed for use with a sidecar, the Acme is fitted with an 8 h.p. J.A.P. engine, Sturmey-Archer gear box, and chain and belt transmission. The sidecar lugs are built integral with the frame, and the steering head and lugs are steel stampings. Lubrication is carried out by suction through a sight feed lubricator, which is supplemented by a hand pump carried on the off side of the tank in a position convenient to the driver's hand. Brampton spring forks are fitted as standard, and wide mudguards with deep valances give ample protection to the driver and machine. The tank is of large capacity, accommodating 2⅓ gallons of fuel and 3⅓ pints of oil, so that on tour there is no necessity to be constantly filling up. So successful has this model proved during the past season that it has been decided to supplement it by a similar machine with a 5-6 h.p. J.A.P. engine, this being regarded as a dual-purpose mount. The engine has a bore and stroke of 70×85 mm., giving a cubic capacity of 654 c.c. In other respects the specification is identical with that of the more powerful model, and the same finish of black with a grey-panelled tank lined with gold is adopted. The two machines are known respectively as Model A and Model B, the price of the latter, complete with sidecar, spare wheel, and carrier, being £210 18s. An exceptionally long wheelbase is a feature of both Acmes that is not without advantages.



An imposing big twin, the 8 h.p. J.A.P.-engined Acme has a long wheelbase and spring saddle-pillar, both of which add to the rider's comfort.



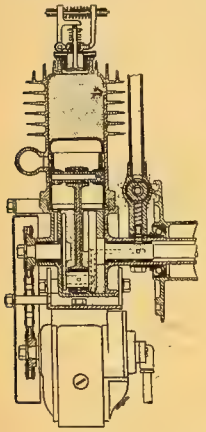
5-6 h.p. Acme J.A.P. three-speed chain and belt-driven sidecar.

The Olympia Show.—

CYKELAID. (49.)

1¼ h.p.; 51×51 mm. (105 c.c.); two-stroke; mechanical lubrication; Amac carburetter; Runbaken chain-driven magneto; single-speed gear; chain drive; 28×1¾in. tyres.

THE SHEPPEE MOTOR CO., LTD., York.—The Cykelaid is one of the most interesting small machines in the Show. It is designed to be attached quite easily to the ordinary pedal bicycle, and, when attached, it forms a vehicle which can be used for shopping or even for comparatively long spins. And it should be useful in the country, where the market town or shopping centre is some short distance from the owner's house. The whole of the mechanism is carried on a pair of forks with a special head tube fitting into the head of the cycle. On the left-hand side is a two-stroke engine, having below it, and inverted, a magneto driven by a chain from the crankshaft. The crankshaft is extended right through the front hub, and on the right-hand side is a flywheel with a sprocket, the latter taking the short chain which drives a countershaft, on which is a cork-insert clutch, and power is transmitted back to the front hub through a second chain. It is possible to vary the pressure on the clutch, but it is not intended that this should be a normal part of the control, since simplicity of action is a great claim. One of the most ingenious details of the design is the lubrication, for oil is carried in a vertical tube in front of the bicycle head, and feeds down to a small rotating cylinder, so contrived that it acts as an oil pump. The cylinder is driven by a small gear wheel meshing with a cam path, and the whole device is automatic, oil being supplied to the engine bearings in definite quantities at regular intervals. The makers claim that the device is practically self-steering, and are demonstrating this fact during the Show. Oil and petrol sufficient for a hundred miles are of small dimensions clamped above the mudguard.

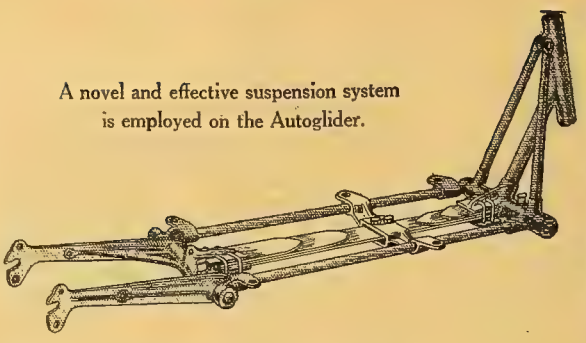


Cykelaid power unit in section, showing the "taximeter" drive for the lubricating pump. The main shaft is extended through the spindle of the wheel hub.

AUTOGLIDER. (21.)

2½ h.p.; 70×70 mm. (269 c.c.); single-cylinder two stroke; petroil lubrication; Amac or Senspray carburetter; Villiers flywheel magneto; single-speed gear; chain drive; spring frame; Palmer 16×2⅜in. tyres. Price £57 15s.

AUTOGLIDER, LTD., Caxton House, Great Charles Street, Birmingham.—



A novel and effective suspension system is employed on the Autoglider.

There are numerous interesting features in the Autoglider, and not the least of these is the spring frame. The frame is rectangular, and between the front and rear portions are two laminated springs in line. Each spring is anchored to a bridge in the centre of the frame, while the two ends are attached to a front member embodying the steering head and forks, engine, tank, etc., and the rear forks respectively, thus insulating the rider from road shocks. A single plate clutch is provided, which may be controlled from the handle-bars, as is the case with one of the models. This clutch, which is particularly sweet in action, and is quite devoid of end thrust, will be placed on the market next year, and will be suitable for any single-speed motor bicycle fitted with the latest pattern Villiers engine.

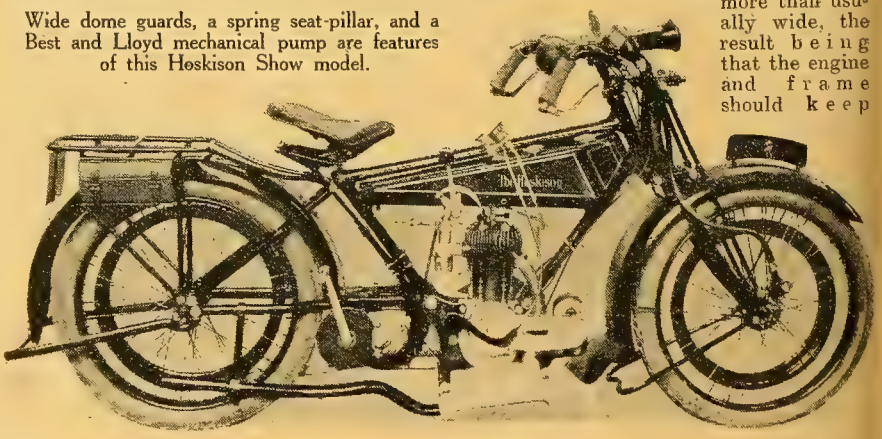
Of the two principal models shown, one is not provided with a seat, but on the platform there is plenty of room for two persons. The transmission is by single chain from the engine-shaft to the front wheel sprocket. Both wheels are almost entirely enclosed; they are of pressed steel, built up in two halves, and consequently easy to clean. Of the models provided with seats, one is slightly lighter than the other, and has a specially tuned engine and a higher gear. There is a spacious locker under the seat. Two box carrier models are also exhibited.

Owing to the careful mudguarding and the fact that a large splashboard is fitted at the front, the rider should have no difficulty in keeping perfectly clean. A single leg is provided on the side of each model, allowing the machine to be propped up. There are two brakes, both of the contracting type, which act on the rear wheel.

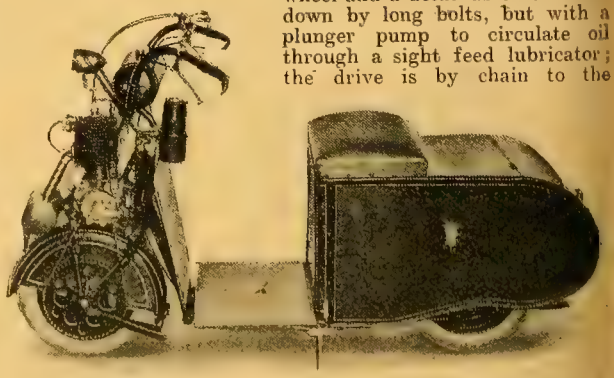
HOSKISON. (51.)

4 h.p. Blackburne; 85×88 mm. (499 c.c.); single-cylinder four-stroke; side-by-side valves; mechanical lubrication; B. and B. carburetter; chain-driven magneto; three-speed sliding dog gear; chain and belt drive; 26×2¼in. tyres.

THE HOSKISON MOTORS, LTD., 72, Lozells Road, Birmingham.—Particular attention has been paid by this firm to the subject of mudguards, as all three types are provided with guards which are more than usually wide, the result being that the engine and frame should keep remarkably clean if the machine is used in winter or during bad weather. A wedge-shaped tank, viewed from the side, gives this machine an unusually rakish outline. One model has a 4 h.p. Blackburne engine with the usual outside flywheel and a detachable head held down by long bolts, but with a plunger pump to circulate oil through a sight feed lubricator; the drive is by chain to the

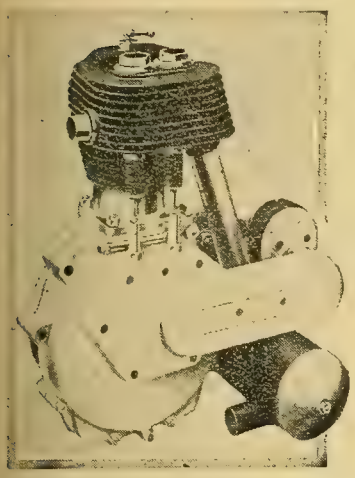


Wide dome guards, a spring seat-pillar, and a Best and Lloyd mechanical pump are features of this Hoskison Show model.

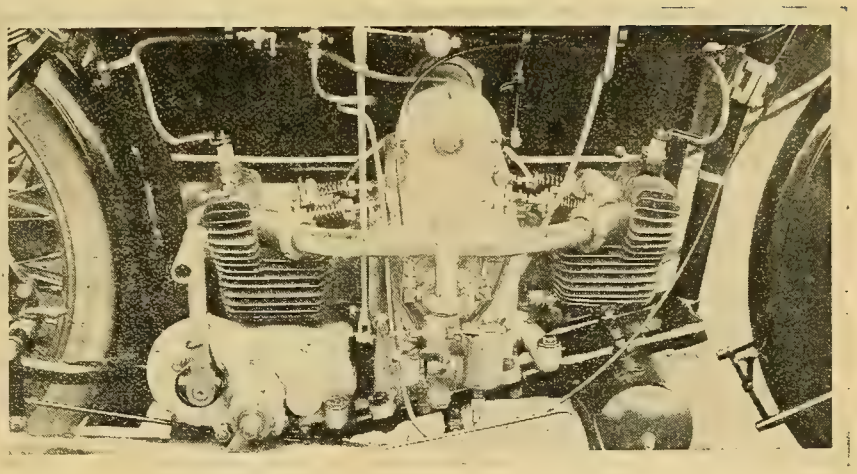


Though the "stand up" type miniature has almost disappeared, the seated variety is exhibited in various forms at the Show. The Autoglider, with parcels compartment, is the subject of our illustration.

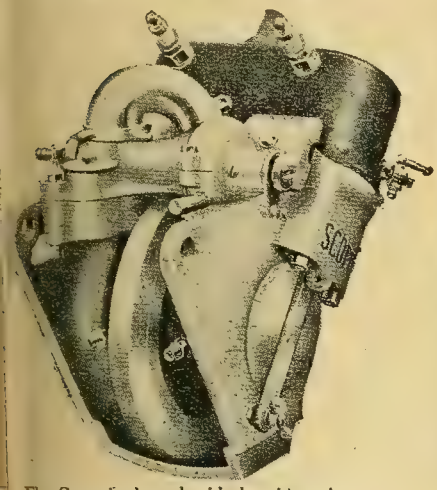
SIX TYPES OF ENGINES AT OLYMPIA.



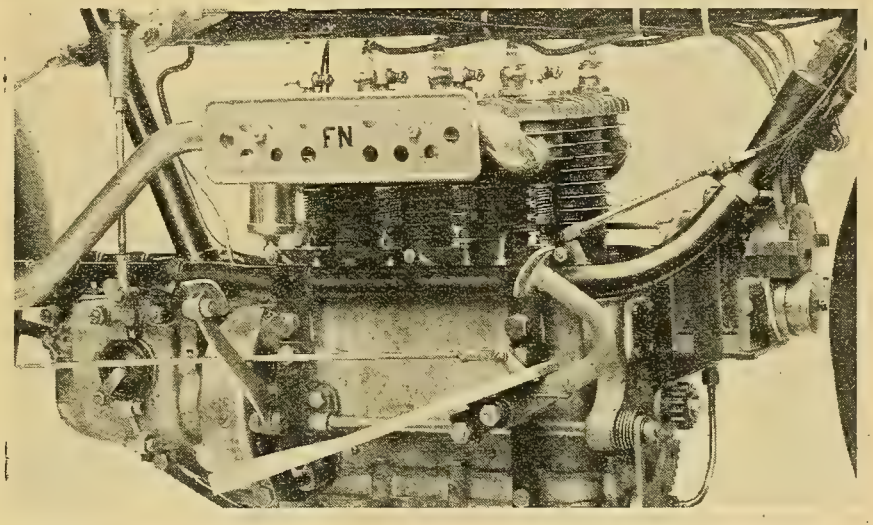
Single-cylinder four-stroke; the Norton is representative of many similar engines



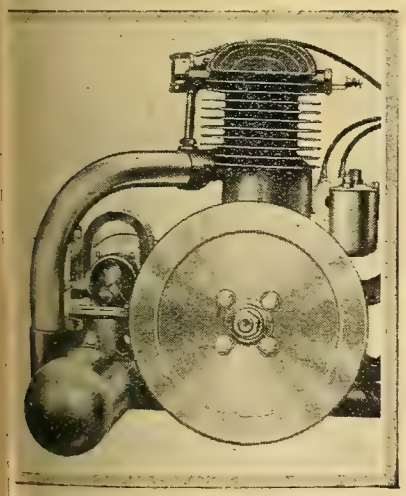
Humber flat twin with gear box under the rear cylinder



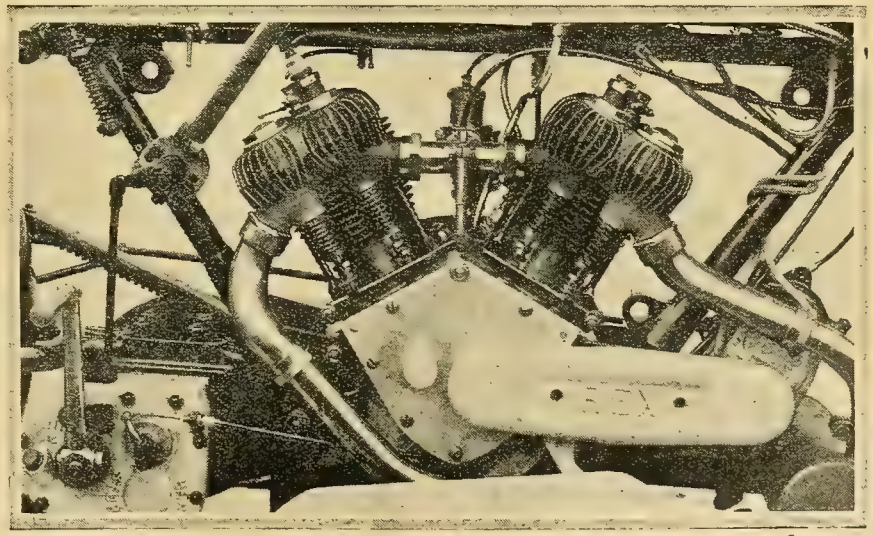
The Scott is the only side-by-side twin two-stroke among the motor cycle exhibits



F.N. four-cylinder, having the gear box built close up to the exposed flywheel and clutch



A simple single-cylinder two-stroke—the Kingsbury.



Rex-Blackburne big twin with Sturmey-Archer gear.

The Olympia Show.—

gear box, and by belt to the rear wheel. The tank is of a new shape and larger than hitherto. On a 2¾ h.p. model, also with a Blackburne engine, disc wheels are fitted, and advantage has been taken of this fact to arrange a V rim for the front wheel brake, so that the shoes for the front and rear wheel brakes are practically the same in size, and therefore the retarding effect is uniform. For the better comfort of the rider, the seat is held, not on the usual pillar, but on a Flexa vertical leaf spring, additional coil springs being introduced between the side of the frame to which this leaf spring is attached. A second 2¾ h.p. model is of sporting type as regards general design, and is shown with footrests instead of the footboards of the previous machine. A Union engined two-stroke also forms a part of the exhibit and is on conventional lines, except for the seat-pillar and mudguard, which are of the same pattern as those used for the larger model. Sectioned gear boxes are shown on the stand, so that the operation of the clutch, the dogs which alter the gear ratio, and the kick starter may be studied.

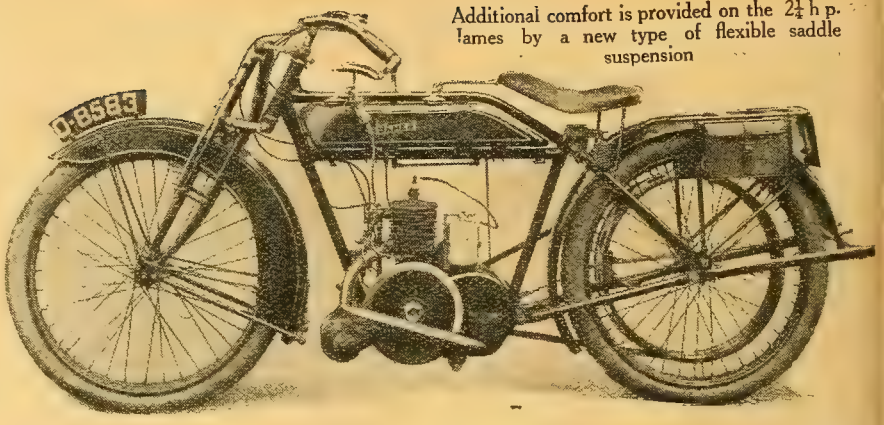
JAMES. (88.)

2¼ h.p.; 66×70 mm. (239.5 c.c.); single-cylinder two-stroke; drip feed lubrication; Amac carburetter; Thomson-Bennett chain-driven magneto; two-speed dogs and chain gear; chain and belt drive; 26×2¼in. tyres. Price £75.

JAMES CYCLE CO., LTD., Greet, Birmingham. — A machine of high-class specification which possesses many refinements is the James 2¼ h.p. two-stroke. It is a true lightweight with 26in. wheels and tyres, and a riding position which is as low as it is comfortable, a specially adapted Lycett saddle with spring peak being fitted. Minor improvements have been carried out, and the engine has been slightly increased in size, as formerly it had a cubic capacity of 226 c.c.

3½ h.p.; 64×77 mm. (500 c.c.); twin-cylinder four-stroke; side-by-side valves; drip feed lubrication; Amac carburetter; Thomson-Bennett chain-driven magneto; three-speed sliding gears; chain drive; 26×2½in. tyres. Price £135.

Twin engines of 500 c.c. are nowadays rare, but the popularity of the 3½ h.p. twin James is little likely to suffer for that reason. As a solo machine it has the merit of lightness combined with power, and with large footboards and a comfortable riding position it is a mount which can be ridden a considerable distance in the day without causing a feeling of fatigue to the rider. The position of the magneto high up behind the rear cylinder ensures that it is protected from wet, and it is at the same time accessible.



Additional comfort is provided on the 2¼ h.p. James by a new type of flexible saddle suspension

4¼ h.p.; 86×103 mm. (600 c.c.); single-cylinder four-stroke; side-by-side valves; drip feed lubrication; Amac carburetter; Eclipse gear-driven magneto; three-speed sliding type gear; chain drive; 28×3in. tyres.

The big single-cylinder James has been refined and brought up to date, so that it should continue to be a very popular sidecar machine. Apart from minor alterations, 28in. wheels and large domed mudguards are fitted. The latest gear control is a long lever pivoted to the crank case, working in a cast aluminium rack secured to the frame just underneath the tank. The clutch is controlled by a conveniently arranged heel pedal, although, if preferred, hand control or both may be fitted. The return spring of the kick-starter is enclosed and protected from mud and dust, a flat ribbon spring, similar to the main spring of a clock, being utilised. The half compression device has been improved in operation, the cable being abolished and replaced by a neat lever which can be brought into operation by the toe.

7 h.p.; 73×89.3 mm. (749 c.c.); twin-cylinder four-stroke; side-by-side valves; drip feed lubrication; Amac carburetter; Thomson-Bennett chain-driven magneto; three-speed sliding gear; chain drive; 28×3in. tyres.

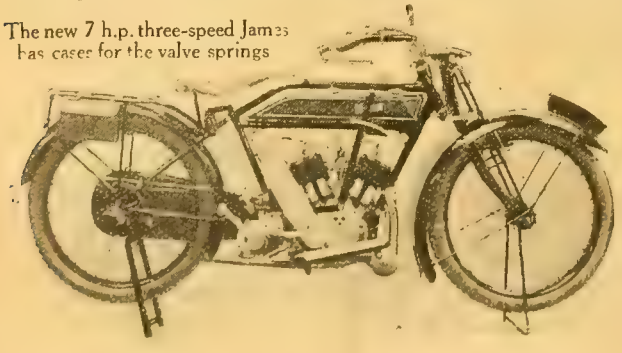
Considerable interest centres in the big twin James, as it is an entirely new model for 1921. A feature of the engine is the off-setting of the exhaust valves in relation to the inlet valves, a clear passage being left between the valve ports and the cylinders, resulting in very efficient cooling. Another advantage of this construction is that the valve rocker levers may be kept straight instead of being cranked. The valve springs and tappets are encased by quickly detachable covers. A large roller bearing big end is employed, and the gudgeon pin is secured in the little end of the connecting rod, taking its bearings direct in the piston in bosses of ample dimension.

Apart from the usual oil lead to the crank case a separate lead is taken to each cylinder. The gear box has been redesigned and consists of a die casting with short rigid shafts and gears carried in Hoffmann bearings of large size. The rear wheel is quickly detachable, leaving the chain sprocket *in situ*. An expanding brake on car lines is fitted in a drum on the rear wheel. The sidecar connections have universal movement so that alignment is easily carried out.

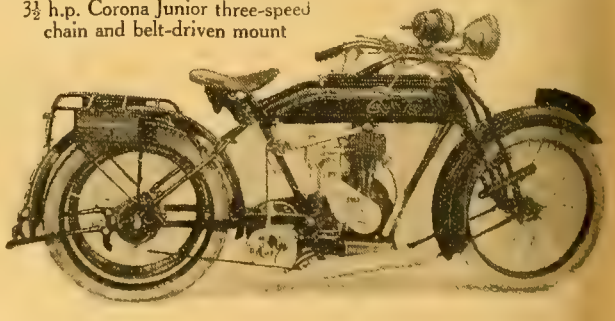
CORONA. (47.)

3½ h.p.; 72×100 mm. (448 c.c.); single-cylinder four-stroke; side-by-side valves; forced lubrication; Amac carburetter; E.I.C. magneto; two-speed Sturmey-Archer gear; chain and belt drive; 26×2½in. tyres. Price £105.

METEOR MANUFACTURING CO., LTD., 98, Tollington Park, London, N.4.—It is obvious that the designers of the Corona Junior had in mind motor car practice when their machine first was evolved, many of the features of the engine being those with which the car driver is familiar. For example, the crank case, of cast iron, contains a very substantial sump to hold a reserve of oil. From the timing gear is driven a small pump, which sucks oil from the sump and delivers it to the bearings of the engine,



The new 7 h.p. three-speed James has cases for the valve springs



3½ h.p. Corona Junior three-speed chain and belt-driven mount

The Olympia Show.—

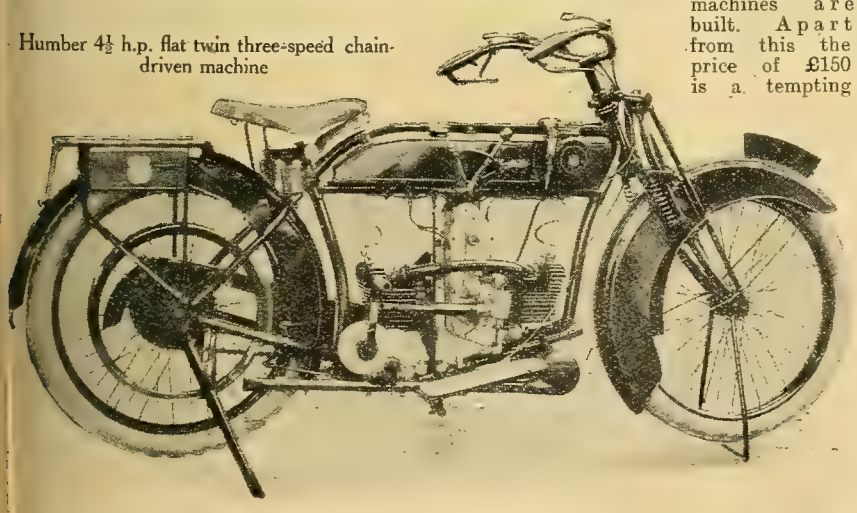
the pump case having on it a sight feed, so that the flow can be seen while the machine is running. There is a detachable head, and the rest of the cylinder is cast with the crank case. The cams are side by side and in a different plane from which we are accustomed, the two valves being one behind the other in a fore and aft direction, and inclined as a V. There is an outside flywheel of considerable size, which is concealed from view by a casing. Another feature of the design is the very large and efficient looking brakes, one expanding, the other contracting on a drum bolted to the rear wheel hub. It is claimed that no castings whatsoever are employed throughout the frame, and it may be mentioned that the wheels are carried on Skefko ball bearings of considerable size. One model has a direct belt drive, but otherwise is the same as its predecessors. Another detail of interest is the front suspension, the spindle being held in a bell crank lever, the vertical arm of which is placed between a pair of strong coil springs. To the rocking arm of this suspension car type grease cups are fitted.

HUMBER. (86.)

4½ h.p.; 75×68 mm. (600 c.c.); flat twin-cylinder four-stroke; side-by-side valves; mechanical lubrication; Claudel carburetter; E.I.C. gear-driven magneto; three-speed countershaft gear; chain drive; 26×2½ tyres. Price £140.

HUMBER, LTD., Coventry.—Whether it be as a solo touring machine, a sporting model with dropped handle-bars and footrests in lieu of footboards, or a sidecar machine, the horizontally-opposed twin Humber is an attractive mount with a considerable reputation which has been lately enhanced by its fine performance in the Six Days Trial. Tractability and silence are, perhaps, its chief characteristics, and they are backed up by sound design and considerable experience of manufacture. Points of interest are found in the detachable valve ports and the shock absorbing device in the rear hub, all-chain drive being employed. Examples of the sporting model and the all-black finish solo model are shown, in addition to the standard mount, the price of all three solo machines being the same. As a sidecar outfit the price is £173 12s. 6d., and the sidecar is both roomy and comfortable. A feature of considerable interest is the mechanical pump lubrication system, supplemented by a drip feed from the oil tank. The disposition of the engine and gear box in the frame is neatly and strongly carried out. The chain-drive is protected by a stout guard, but is not completely enclosed. The rear brake is remarkable for the size of the shoe and the ease of operation, while the kick-starter mechanism is encased in the main gear box casting and thus protected from mud and dust.

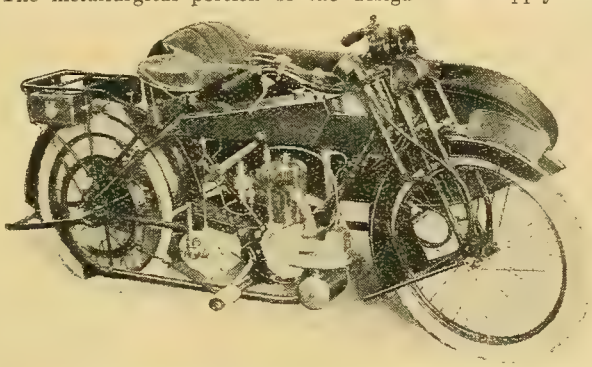
Humber 4½ h.p. flat twin three-speed chain-driven machine



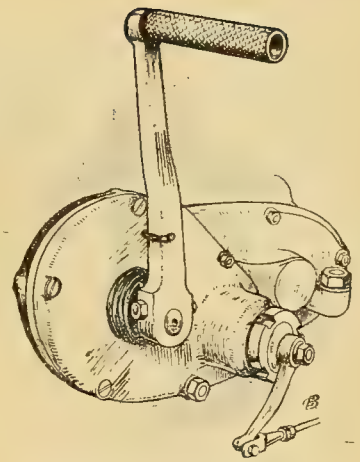
SHEFFIELD HENDERSON. (44.)

4 h.p. Blackburne; 85×88 mm. (499 c.c.); single-cylinder four-stroke; side-by-side valves; vacuum lubrication; Amac carburetter; Runbaken chain-driven magneto; three-speed Sturmey-Archer gear; chain drive; 26×2½in. tyres.

HENDERSON SIDECARS, Aero Works, Fitzwilliam Street, Sheffield.—One of the most interesting machines in the Show is the new 4 h.p. Sheffield Henderson and sidecar. It has many unusual features. The metallurgical portion of the design has been considered with more than usual care, and its makers are one of the few firms who know in actual fact what the nature of the material is of which their machines are built. Apart from this the price of £150 is a tempting enough bargain for a good motor cycle and sidecar. The machine itself is fitted with a 4 h.p. Blackburne. It is in the lubrication of the engine, however, that a great change has been made, as the supply of oil to the cylinder automatically increases with the opening of the throttle. This is effected by shaping the end of the exhaust pipe from the cylinder as a nozzle, and inserting it in the mouth of a second pipe leading to the silencer proper, there being a gap between the two. Exhaust gas rushing down the pipe would cause air to be drawn in through the gap exactly after the fashion of the ejector. In this case both nozzle and gap are surrounded by a ball-shaped chamber, which is connected by a pipe with a cylindrical container below the oil tank in such a manner that all the air is sucked out of this cylinder by the ejector action of the exhaust gases, which, of course, varies with the loads on the engine. By creating a vacuum, oil is sucked from the tank through a Best and Lloyd adjustable lubricator. From the oil container a pipe leads to the crank case, and is fitted with a non-return valve, so that lubricant which enters the container is sucked into the crank case every time the piston rises. As a result of this arrangement, the greater the engine loading the greater the amount of oil delivered to the crank case. As regards the frame of the machine, the construction of the forks and head is interesting, because very large steel balls are used for all the bearings, while the recoil of the front wheel is taken on C shaped leaf springs, which are bolted very rigidly to the forks. At the rear the saddle is fixed upon a cantilever bracket which can be adjusted to give increased or decreased leverage, the load being taken through springs to the frame, so that the

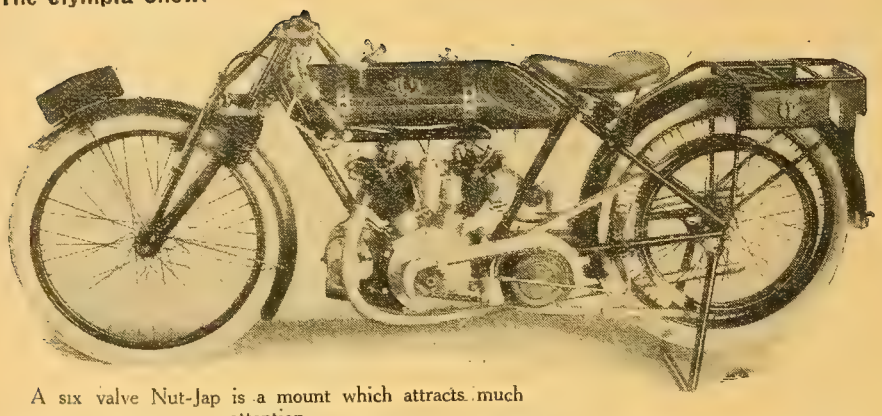


A 4 h.p. Henderson sidecar outfit, the engine of which has an ingenious system of lubrication by exhaust vacuum.



The new kick-starter and clutch-actuating lever on the Humber flat twin.

The Olympia Show.—



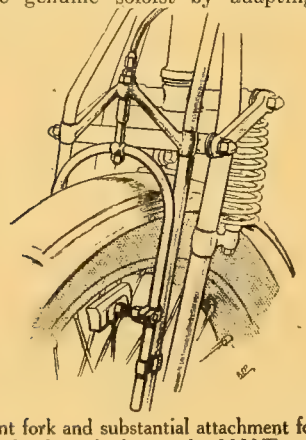
A six valve Nut-Jap is a mount which attracts much attention.

rider's weight is entirely sprung. The remainder of the machine is normal, chain drive from the crankshaft to a Sturmey-Archer gear box, thence to the rear wheel through another chain; both brakes act on a rear wheel dummy belt rim.

N.U.T. (140.)

5 h.p.; 70×88 mm. (680 c.c.); V twin four-stroke; side-by-side valves; drip feed lubrication; Amac carburetter; chain-driven Magdyno; three-speed Sturmey-Archer gear; chain and belt drive; 26×2½in. tyres.

NEWCASTLE-UPON-TYNE MOTOR CO., LTD., St. Thomas Street, Newcastle-upon-Tyne.—Last year the 3½ h.p. N.U.T. was introduced as a model designed expressly for solo work. However, in practice it was found that the average owner did not honour this stipulation, and thus the makers were faced with the common problem of either spoiling their machine for the genuine soloist by adapting it



Front fork and substantial attachment for the front brake on the N.U.T.

for sidecar work, or of providing a new model more on dual-purpose lines. Wisely, we think, they chose the latter course, and the new 5-6 h.p. N.U.T. is the result. With the exception of an increase in cylinder dimensions, it is similar in appearance to the standard 3½ h.p. model, which is also shown. Equipment includes a Lucas Magdyno lighting set. Although the 3½ h.p. machine is retained (with lower gear ratios) as the purely solo mount, the larger twin, by reason of its light weight and final belt drive, is eminently suited for that purpose as well.

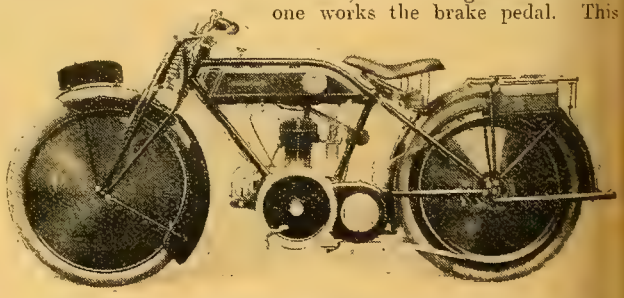
3½ h.p.; 64.5×76 mm. (500 c.c.); V twin four-stroke; two inlet and one exhaust overhead valves; drip feed lubrication; special Amac carburetter; T.B. chain-driven magneto; three-speed Sturmey-Archer gear; chain and belt drive; 26×2½in. tyres.

Throughout the Show there is evidence of a widespread desire to cater for the sporting rider, and the new overhead-valved N.U.T. is a striking example. Possessing one inlet and two exhaust valves per cylinder, the engine is of a special racing type, has aluminium pistons, and gives, it is claimed, 15 b.h.p. at 4,000 r.p.m. Roller bearings are used for the connecting rods, and very neat detachable cylinder heads carry the overhead valve gear. The lowest ratio provided by the three-speed Sturmey-Archer gear box is 8 to 1. Spring forks, mudguarding, and silencing arrangements (according to the makers, "within the law but giving that deep note"!) are on genuine T.T. lines; but the types are amply large for comfort, and the equipment is unusually complete.

MASSEY-ARRAN. (24.)

5-6 h.p.; 70×85 mm. (654 c.c.); twin-cylinder four-stroke; side-by-side valves; drip feed lubrication; Amac carburetter; E.I.C. chain-driven magneto; three-speed Sturmey-Archer gear; chain and belt drive; Dunlop Magnum 700×80 mm. tyres. Price £145 sports model; £185 touring model.

MASSEY-ARRAN MOTORS, Delbarn Road, Birmingham.—The sports model Massey-Arran is quite a handsome machine, well-finished in black and gold, and fitted with wide and well valanced mudguards, that at the rear being of specially generous dimensions. Among the features of this machine may be mentioned the symmetrically designed expansion chamber at the base of the crank case, the final exit for the exhaust gases being through a long tail pipe with flattened and slotted end. The clutch is controlled not only by the usual type of lever on the handle-bars, but there is a heel-operated pedal attached directly to the clutch-operating mechanism on the gear box. A spacious tool box is provided at the rear, with an aluminium lid covered with corrugated rubber matting and eyelets for strap. The footrests are of registered design, and are fitted with detachable rubber pads so that they can be easily replaced when worn. For future models there will be two concentric internal expanding brakes, foot-operated, and working on a drum with two frictional surfaces, while a further expanding brake is fitted to the front wheel. The touring model is similar in every respect, except that Massey-Arran footboards of registered design are fitted. These are of aluminium, containing a certain percentage of copper, which does away with the risk of this metal breaking, owing to its brittleness when used pure. A similar material is employed for the chain cover and the silencer. The footboards are turned up in front, and through the left-hand one works the brake pedal. This pedal may be fitted to the other side of the machine merely by changing over the footboards. A 2in. horizontal adjustment is provided for each of these.

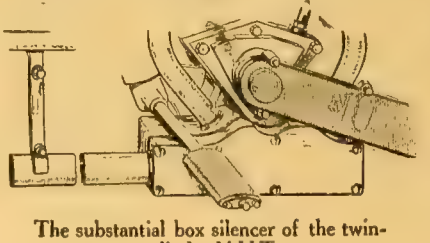


Disc wheels are frequently encountered at the Show. The 2¾ h.p. Massey-Arran.

2⅜ h.p.; 71×88 mm. (348 c.c.); single-cylinder four-stroke; side-by-side valves; drip feed lubrication; B. and B. carburetter; Boulton magneto; two-speed Sturmey-Archer gear; chain and belt drive; Dunlop 26×2¼in. tyres.

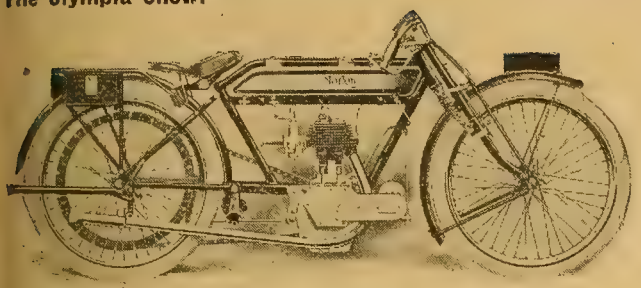
The sports model, fitted with 2⅜ h.p. Blackburne engine, is a very attractive little mount. Like all Massey-Arran productions, it is fitted with celluloid-covered handle-bars, and, similar to the other sports model, it has patent footrests.

The particular model under review is equipped with Maplestone spring forks, which are extremely flexible, and, so we are informed, have very satisfactorily withstood the tests to which they have been put. The black and gold finish, which in this as in all other models is the standard, looks extremely well. One feature, which is common to all models, is the type of petrol tank filter, which, when unscrewed, allows a valve

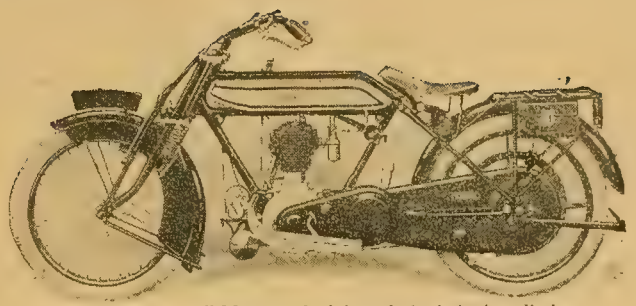


The substantial box silencer of the twin-cylinder N.U.T.

The Olympia Show.—



A speedman's "simple single"—the 3½ h.p. single-geared Norton.



The "Big Four" Norton which popularised single-cylinder machines for passenger work.

to drop on to its seating, thus allowing the gauze to be cleaned without any loss of petrol. All steel parts are rendered rust-proof. A similar sports model is shown fitted with a 2¾ h.p. J.A.P. engine.

Another model is fitted with the 2¾ h.p. J.A.P. engine, and is equipped with the latest pattern Sturmey-Archer gear box with circular quadrant. All models are fitted with a gear box adjusting screw.

NORTON. (71.)

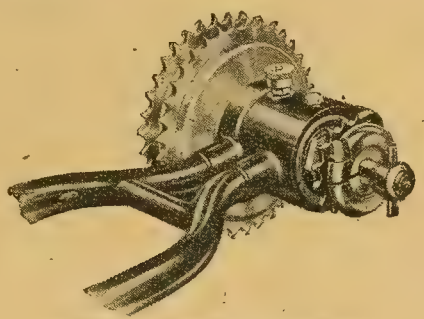
3½ h.p.; 79×100 mm. (490 c.c.); single-cylinder four-stroke; side-by-side valves; drip feed lubrication; B. and B. carburetter; C.A.V. chain-driven magneto; three-speed Sturmey-Archer gear; all chain drive; 26in.×2¼in. tyres. Price £132.

Norton Motors, Ltd., Bracebridge Street, Birmingham.—Of the Norton range the 3½ h.p. model is well-known by its successes on the track. As a three-speed roadster it is perhaps one of the fastest touring machines existing, while it is also a very attractive sidecar mount when fitted with a light attachment such as the new Norton sidecar to which it is seen affixed. The low riding position is remarkably comfortable, and it is safe to say that the Norton reputation could not be obtained merely by the excellence of the engine alone, for riding position and road worthiness play an important part in speed work on the track. This model may also be obtained single-geared as a speed machine with an engine which is guaranteed to lap Brooklands at 70 m.p.h., or to cover the kilometre at 75 m.p.h.

4 h.p.; 82×120 mm. (635 c.c.); single-cylinder four-stroke; side-by-side valves; drip feed lubrication; B. and B. carburetter; C.A.V. chain-driven magneto; three-speed Sturmey-Archer gear; all chain drive; 650×65 mm. tyres. Price £135.

As a sidecar machine the "Big Four" has a reputation second to none, and, like its 3½ h.p. relative, it is also one of the fastest machines of its type on the road. The same general lines are followed in the design, but the chain drive is totally enclosed as distinct from the 3½ h.p. model, which has a chainguard on the upper portion of the drive only. Larger tyres are also fitted to the "Big Four," and if desired 700×80 mm. tyres may be obtained as an extra.

Wide domed guards are provided, and with its enclosed drive and large rubber covered aluminium footboards, it is an all-weather mount in every respect. A model is also shown fitted with the Lucas Magdyno.



Countershaft portion of the Kingsbury expanding clutch gear.

KINGSBURY. (43.)

2¾ h.p.; 75×79 mm. (349 c.c.); single-cylinder two-stroke; hand pump lubrication; Senspray carburetter; C.A.V. chain-driven magneto; two-speed selective clutch gear; chain drive; 26×2¼in. tyres.

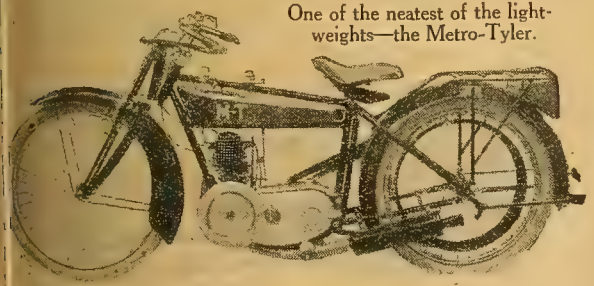
Kingsbury Engineering Co., Ltd., Kingsbury Engineering Works, Kingsbury.—Originally interested in aviation, the above company are the manufacturers of a small and popular two-cylinder car as well as of the new two-stroke motor cycle shown on the stand. The cycle is of medium weight and of straightforward design, and is fitted with a substantial carrier and toolbags enclosed and reinforced by steel casings. Footrests are fitted instead of footboards, and the drive is by chain throughout, protected by light casings, only the upper portion of the final drive chain being covered. Care has been taken to provide ample clearance between the tank and the frame, and the fillers are of such size that it is possible to replenish both tanks without spilling. The coil spring against which the front forks rock is enclosed in a metal cover of neat design. Besides the brake on the front wheel rim, there is a second large and powerful contracting band, which operates on a drum on the rear wheel hub, close beside the driven sprocket. This band is contracted by a pedal placed on the rear footrest, with its plate close to the actuating rod for the change-speed gear. This latter is of the selective clutch type, of very neat design, and slightly modified this year.

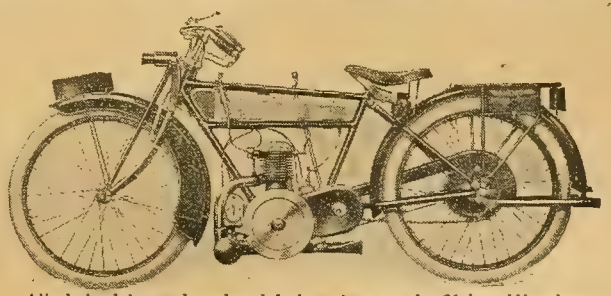
METRO-TYLER. (57.)

2½ h.p.; 70×70 mm. (269 c.c.); single-cylinder two-stroke; hand pump lubrication; Amac carburetter; C.A.V. chain-driven magneto; two-speed constant mesh gear; chain and belt drive; 26×2in. tyres.

Tyler Apparatus Co., Ltd., Bannister Road, North Kensington.—The Metro-Tyler is a small two-stroke which has acquired already a considerable reputation and has not increased too greatly in weight during the past few years, with the result that it still is a small and handy machine suitable for almost every class of work. The two-stroke engine is well forward in the frame, and has a decompressor facing forwards and just above the main exhaust pipe, which latter is carried back to a flexible pipe leading to the silencer clipped to the rear stays. There is a two-speed gear box bolted to

One of the neatest of the lightweights—the Metro-Tyler.





All-chain drive and enclosed fork springs on the 2½ h.p. Kingsbury are unusual refinements on a lightweight.

The Olympia Show.—

extensions of the engine plates and driven by a chain enclosed in a casing, but the engine is made to look more than usually neat; in fact, in appearance to resemble a unit, by adding aluminium cover plates which extend from the crank case to the gear box on each side and render the exterior of the mechanism quite smooth. Beneath these cover plates is the magneto, which thus is effectively protected, in addition to the fact that the field magnets themselves are closed by end plates, and the magneto is, therefore, rendered waterproof. The Metro-Tyler also is one of few machines which have only footrests, these being preferred to the now popular footplates. One model was shown with disc wheels and one of a special chocolate colour, very prettily finished and altogether a most handsome small mount on distinctly speedy lines.

Oil vapour emitted from the Metro-Tyler release valve serves the useful purpose of lubricating the magneto chain.

IXION. (160.)

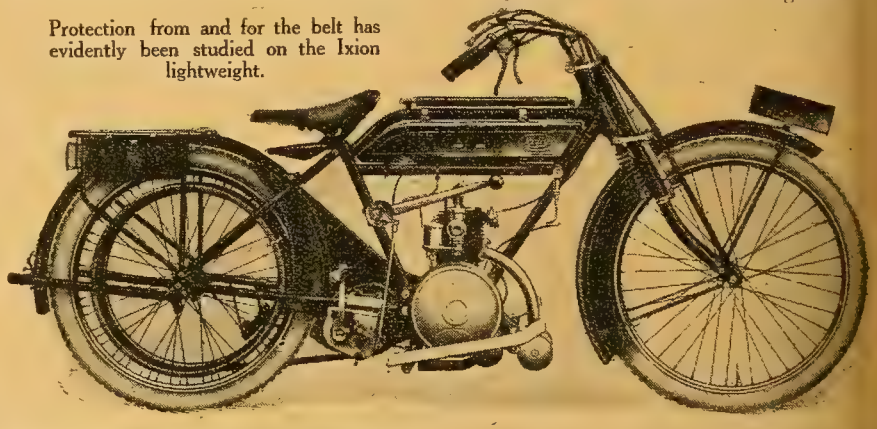
2½ h.p. Villiers; 70×70 mm. (269 c.c.); single-cylinder two-stroke; drip feed lubrication; Amac carburetter; flywheel magneto; two-speed Sturmey-Archer gear; chain and belt drive; Dunlop 26×2¼in. tyres. Price £75; lady's model £78.

IXION MOTOR MANUFACTURING CO., LTD., Great Tindal Street, Birmingham.—Although embodying standard components there are many little points about the Ixion that appeal to the practical motor cyclist. The belt guard, for example, first applied only to the lady's machine, is now fitted to both types. This should be appreciated by the business man and others who ride in ordinary long overcoats. Removal of four set-screws detaches this guard, which is integral with the primary chain cover. Another noticeable little point is the arrangement of the mudshields, which fail to strike the usual jarring note and positively blend with the machine. Nor does efficiency appear to be lacking. Again only a practical rider could have designed the compression release handlebar control. Situated right *above* the clutch lever, it may be operated by the same hand and at the same time, thus allowing the engine to be readily stopped when the clutch is withdrawn. The lubrication is carried out by a cleverly devised combination of Best and Lloyd drip feed and Enots pump.

3 h.p. Precision; 74×81 mm. (350 c.c.); single-cylinder two-stroke; mechanical lubrication; Amac carburetter; M-L chain-driven magneto; two-speed Sturmey-Archer gear; chain and belt drive; Dunlop 26×2¼in. tyres. Price £110 with sidecar.

Special attention has been given to the sidecar connections of this little machine, which sells only as a lightweight outfit. It is claimed that correct alignment once gained cannot be lost, and also that there are fewer loose pins, etc., in the couplings than on any other sidecar on the market. Undoubtedly the connections are very simple, and at the same time amply

Protection from and for the belt has evidently been studied on the Ixion lightweight.



secure. The machine itself follows orthodox lines, and is finished in the customary Ixion shade of khaki green.

R. W. SCOUT. (56.)

2¾ h.p.; 73×76 mm. (318 c.c.); single-cylinder two-stroke; hand pump lubrication; B. and B. carburetter; E.I.C. chain-driven magneto; single speed gear; belt drive; 26×2¼in. tyres.

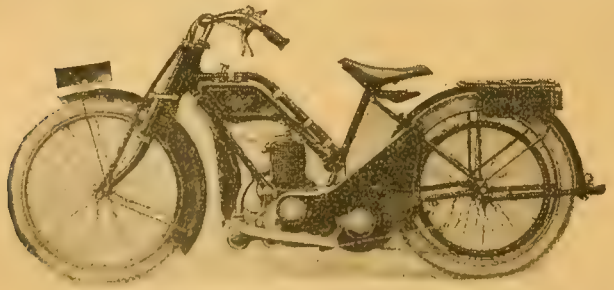
R. WEATHERELL, Southgreen, Billericay, Essex.—The "R. W. Scout" is a quite simple and straightforward little two-stroke, having a Dalm engine, unconventional because of the twin exhaust pipes which project from the forward side of the cylinder, and carried downwards to a cast aluminium silencer. The drive is direct by belt. Behind the engine, and chain-driven, is the magneto, and on the right-hand side the carburetter. On the same stand is a sporting machine, not in any way "show finished," which, if anything, adds to its business-like and sporting character. Outwardly, at all events, the design is similar to the standard machine, but footrests instead of footboards are fitted and, of course, the mudguards have been detached and the handle-bars are dropped.

P. AND S. (38.)

3 h.p. Dalm; 73×76 mm. (318 c.c.); single-cylinder two-stroke; hand and drip lubrication; Amac two-lever carburetter; E.I.C. chain-driven magneto; two-speed Burman gear; chain and belt drive; Hutchinson 26×2¼in. tyres. Price £83 10s.

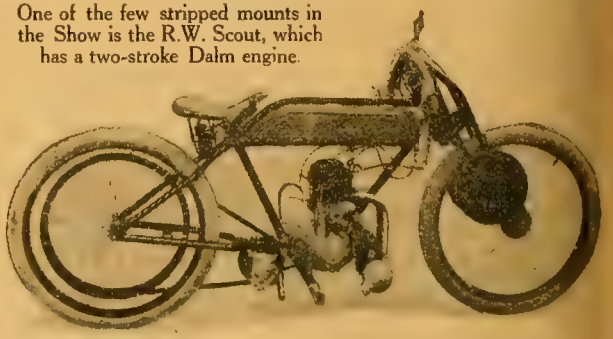
2¾ h.p. J.A.P. (292 c.c.); single-cylinder four-stroke; other details as above. Price £90.

PEARSON AND SOPWITH, 89, Long Acre, W.C.2.—The two-stroke Dalm engined P. and S., equipped with Burman two-speed gear, which incorporates a clutch and kick-starter, is a handy little runabout. Mudguarding is well studied, the guards being of generous dimensions for a lightweight. The comfort of the rider has been looked after, and aluminium-covered footboards form part of the equipment. For those who prefer a four-stroke engine, the lightweight P. and S. fitted with a J.A.P. engine should have a special attraction for solo riders. Except for the engine and magneto, it resembles the other model, and is certainly a thoroughly practical little mount. One of the claims of the firm is that, with the Dalm engine model with sidecar attached, the cost of

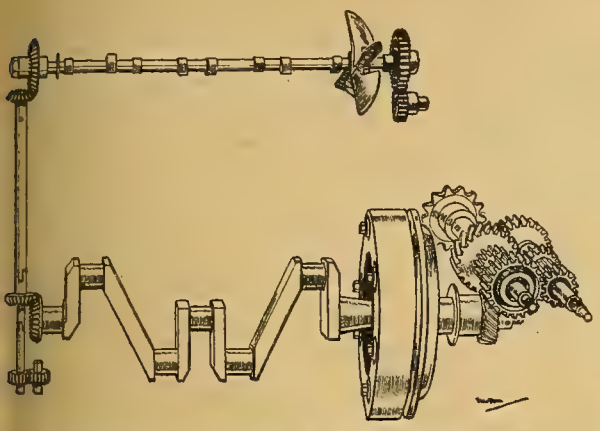


A lady's two-stroke embodying most of the features demanded by the fair sex. The Ixion with ample dress and splash guards, two-speed gear, kick-starter and hand-controlled clutch.

One of the few stripped mounts in the Show is the R.W. Scout, which has a two-stroke Dalm engine.



The Olympia Show.—



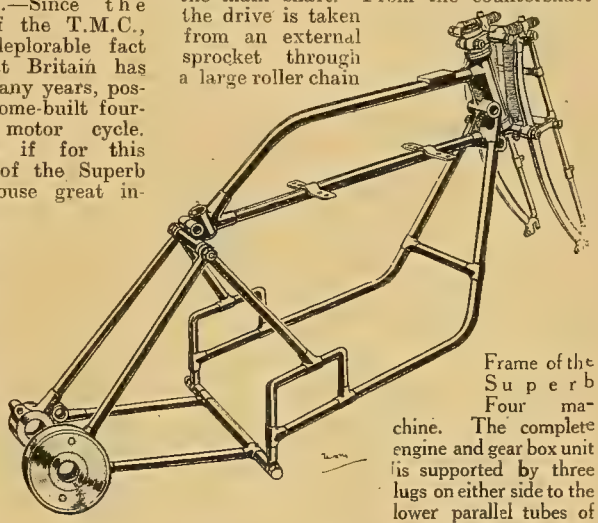
Showing how the crankshaft of the Superb Four drives the overhead camshaft through bevel gears and a vertical shaft at the front of the engine. At the bottom of the vertical shaft will be seen the two gear wheels of the oil pressure pump. Behind the flywheel and the double cone clutch is the skew gear, driving the countershaft three-speed gear.

unning does not exceed 1d. a mile. Quite a feature is the 2¾ h.p. Dalm- ngined sidecar outfit. It is sold com- plete with two bodies, one for business urposes, for use as a trade carrier, and he other for use as a lightweight tour- ng body, forming a treble-purpose achine—as the outfit naturally can be sed solo, and, as a sidecar outfit, it can e used either for pleasure or business urposes. Its price is £127. Among the lo machines exhibited may be men- oned a two-speed model fitted with lain Albion gear box without clutch nd kick-starter, which will be sold to the ublic at £76 10s.

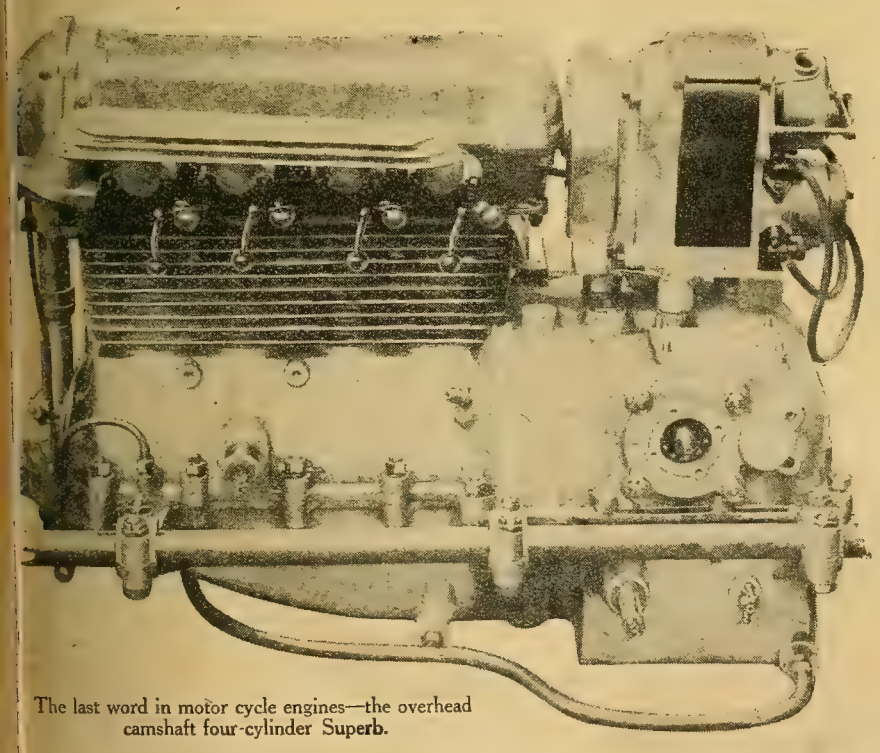
SUPERB FOUR. (37a.)

10 h.p.; 63.3×78.7 mm. (998 c.c.); four-cylinder four-stroke; overhead valves; forced feed lubrication; Zenith carburetter; Lucas chain-driven Magdyno; three-speed gear, integral with engine unit; final chain drive; Dunlop 700×80 mm. tyres.

COPPEN, ALLAN, AND Co., 89, Great Portland Street, W. (sole concessionnaires).—Since the passing of the T.M.C., it is a deplorable fact that Great Britain has not, for many years, possessed a home-built four-cylinder motor cycle. Therefore, if for this reason alone, the advent of the Superb Four is calculated to arouse great interest. But, apart from this, the high efficiency design is unique when applied to a motor cycle, and actually advanced when compared with average car practice. Aluminium is used for the *monobloc* cylinder casting, which includes the upper half of the crank case; and an aluminium casing completely encloses the overhead camshaft, and valve gear. Steel liners are pressed into the cylinder barrels. By withdrawing a series of nuts, the entire cylinder head (including the valves and valve mechanism) may be removed for decarbonising. Longitudinal fins are cast above the valve pockets, and, for additional cooling, a continuous draught of air is induced along the interior of the camshaft casing from a pipe connected to the carburetter air intake by a small fan on the rear end of the camshaft. Lubrication is by forced feed to the cylinder walls and to every important bearing in the power unit. In the flywheel is incorporated a double cone clutch, which drives the transverse countershaft in the gear box through a pair of helical gear wheels. Three speeds are provided by the gear set, which has constant mesh gear wheels and sliding dogs, the layshaft being just at the rear of the main shaft. From the countershaft the drive is taken from an external sprocket through a large roller chain to the rear wheel. A new form of detachable wheel, simply designed and of very strong construction, is being incorporated in this machine, while there are many other novelties, such as a miniature instrument board between the handle-bars for all the lighting instruments, etc., a water trap in the main petrol tank, special sidecar connections, twist grip controls, and a four-gallon petrol tank.



Frame of the Superb Four machine. The complete engine and gear box unit is supported by three lugs on either side to the lower parallel tubes of the frame.



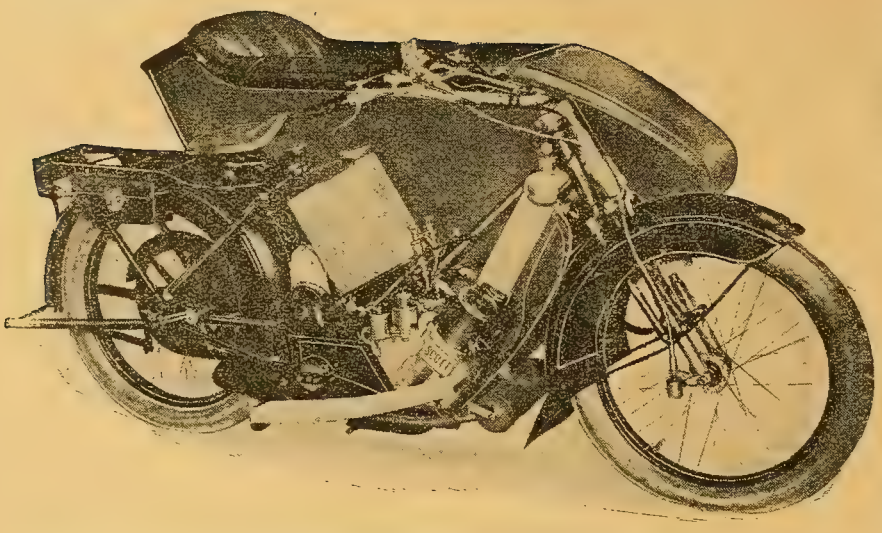
The last word in motor cycle engines—the overhead camshaft four-cylinder Superb.

MOTORPED. (18.)

1¼ h.p.; 51×51 mm. (105 c.c.); single-cylinder two-stroke; petroil lubrication; Amac carburetter; Runbaken magneto; single-speed gear; chain drive; 28×1½in. tyres.

PATRICK ENGINEERING CO., LTD., Brierley Street, Birmingham. — The Motorped is new in name only—this being the title the makers of the Simplex cycle attachment give to the complete cycle built by them, and equipped with their power unit. One of the earliest units made for this purpose, the Simplex is a "flat" two-stroke single of fairly conventional design. A tiny plate clutch is optional this year, and a means is provided of holding the plates permanently apart should the need arise on any occasion for pedalling home. Merely an ordinary pedal machine of strong build, the cycle itself may readily be re-converted to a "one rider power" mount. With clutch the Motorped sells at £42, without at £37 16s.

The Olympia Show.—

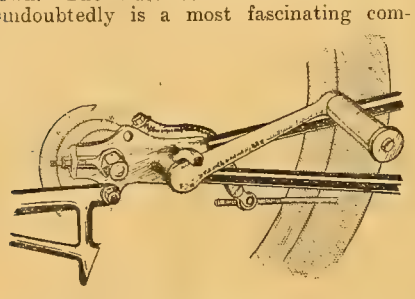


A moderate-powered sidecar outfit is the 3¾ h.p. two-stroke two-speed Scott. 26in. × 3in. Palmer light car tyres are fitted all round.

SCOTT. (148.)

3¾ h.p.; 71×69 mm. (532 c.c.); twin-cylinder two-stroke; automatic lubrication; Amac carburetter; T.B. chain-driven magneto; two-speed expanding clutch gear; chain drive; Palmer 26×2½in. tyres.

Scott Motor Cycle Co., Ltd., Saltaire, Yorkshire.—Scotts are becoming quite a cult, and it is very noticeable that Scott riders are generally very exclusively Scott enthusiasts. And each year this circle of admirers so widens that it is extraordinary that so many of the Bradford firm's features remain exclusively their own. The water-cooled twin two-stroke undoubtedly is a most fascinating combination to own and to drive; and, although outwardly little change is apparent, each year it takes a step nearer a very advanced ideal of perfection. During the past year, for instance, the kick-starter stop and the release valve lever stop on the handle-bar have been made integral with their respective frame members, thus eliminating two loose lugs. Attention has also been directed to strengthening the frame at various points to make it more fitted for hard sidecar work. Not only on account of it being something different, but because it has more than held its own in open competition with the aristocracy of the industry, the whole design is worthy of careful study. The open frame has been designed on scientific lines; the spring fork is one of the most comfortable in existence, while the footboards, now rubber-padded, and mudguarding are excellent. In addition to a standard and T.T. machine, a sidecar outfit with the well-known Scott sidecar and Lucas Magdyno lighting is shown, also a sectionised and complete engine, gear box, and various component parts. Although shown, deliveries of the very latest Squirrel model will not commence until May. The Squirrel is a T.T. Scott with shorter and lower frame, footrests, no carrier, and usual racing equipment (such as ultra-narrow mudguards and dropped handle-bars). In this machine, as on all Scotts, the gear box is now lubricated from the drip feed pump.

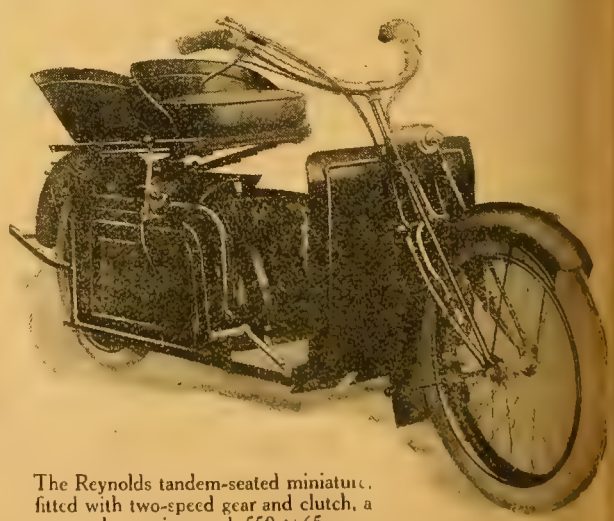


On the Scott the fork-end lug has incorporated with it a stop for the kick-starter. The underside serves as a rest for the stand.

REYNOLDS. (17.)

2½ h.p.; 70×70 mm. (269 c.c.); single-cylinder two-stroke; drip feed lubrication; Senspray carburetter, flywheel magneto; two-speed Albion gear; chain and belt drive; 550×65 mm. tyres. Price £94 10s.

Jackson Car Manufacturing Co., Pangbourne, Berks. — The Reynolds Runabout deserves a much better location than its little niche under the gallery. This machine is rather difficult to describe, but might be termed a "utility tandem lightweight," appealing to people who want something as handy as a scooter but altogether faster and roomier. The front portion of the machine is reminiscent of the cockpit of a car, consisting of a broad dash and floor some sixteen inches wide, which enables the rider to keep perfectly clean whilst wearing his ordinary clothes. The main horizontal frame members are of ten-gauge tube. The rear half of the frame is carried upward by means of two vertical struts and upper cross pieces. In the compartment so formed, the two-stroke engine and gear box are carried, being demountable by the removal of four bolts. The petrol tank is located above the engine, supported by means of laminated and coiled springs. On the top of this compartment is a platform carrying a small bucket seat for the driver. The platform is long enough to take another bucket seat for the pillion rider or a parcel box as required. The sides of this rear compartment of the frame are cowled in with sheet metal panels secured by spring clips. In front of the engine is a wire dressguard. Cooling ought to be satisfactory, as the rear cowls are splayed out to catch the draught. An oil tank and tool box are carried on the metal dash. Clutch and brake pedals are in the floor of the cockpit, and the kick starter is also mounted here, and connected to the engine by a long horizontal rod. The machine scales about 190 lb. As this is somewhat heavy for an elderly woman to raise on to the stand, the designer has incorporated a lever some eighteen inches long; the ease with which the machine can be put on the stand by means of this lever is simply astonishing. A child could operate it.



The Reynolds tandem-seated miniature, fitted with two-speed gear and clutch, a two-stroke engine, and 550 × 65 mm. tyres.

COVENTRY VICTOR. (247, Gallery.)

5-7 h.p.; 75×78 mm. (688 c.c.); flat twin-cylinder four-stroke; side-by-side valves; semi-automatic sump lubrication; B. and B. or Amac carburetter; chain-driven magneto; three-speed Sturmey-Archer gear; chain drive; 650×65 mm. tyres.

Coventry Victor Motor Co., Ltd. Coventry.—In addition to a full range of its well-known engines, this company stages a complete motor cycle constructed of its special fittings. Any cynic who holds that a full-sized flat twin cannot be accessibly housed in a motor cycle frame should study this machine. The magneto, carburetter, and valves are all instantly get-at-able. Each cylinder can be de

AGENTS: We are now arranging agencies for 1921—write us for particulars.

DUNELT
TWO-STROKE

The only 500 c.c. Air-cooled Two-stroke on the Market!

If visiting the OLYMPIA SHOW, don't fail to see the "DUNELT"—it has many original features that will interest you, many superior points that merit your consideration—and is altogether a machine of outstanding quality and efficiency.

The ENGINE is quite original and for simplicity, accessibility, and power, stands supreme. An inclusive and important feature is the Truncated Piston, whereby a larger charge of gas is drawn into the Crank Case, and transferred to the Combustion Chamber, thus improving the scavenging.

It is most flexible, will two-stroke perfectly at all speeds, develops 10 to 12 h.p., and will keep cool under the most trying conditions.

Make a note of the Stand "No. 138," and let it be one of your first calls—or failing a visit, write us for Catalogue.

AT OLYMPIA STAND No. 138

"DUNELT" machines gained TWO GOLD MEDALS in the A.C.U: SIX DAYS TRIALS.

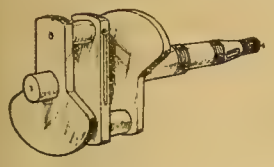
In answering this advertisement it is desirable to mention "The Motor Cycle."

The Olympia Show.—

tached if necessary, leaving the rest of the engine in position. If the exhaust unions are unscrewed, and the clamp plate beneath the engine is removed, the entire engine can be lifted out on the right-hand side of the machine. There is no more accessible job in the Show. Another unusual item is the provision made for removing the back wheel. The slots in the rear fork-ends are unusually



The balanced crankshaft of the Coventry Victor horizontally opposed twin.

long, and, by running up the draw bolts with the fingers, the back wheel can be brought so close up towards the engine that the chain can be slipped off the sprocket, after which the wheel can, of course, easily be withdrawn from the fork-ends.

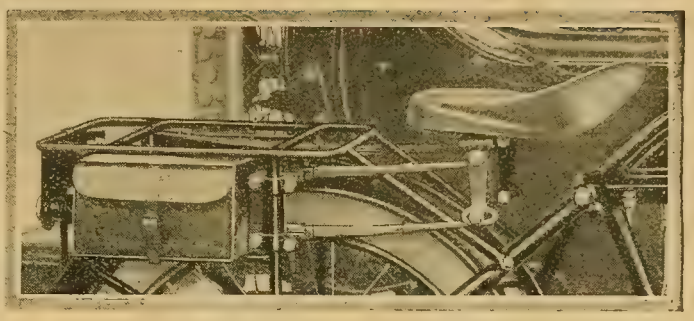
J.E.S. (111.)

1 h.p.; 56.6×60.3 mm. (146 c.c.); single-cylinder four-stroke; inlet overhead exhaust valves; mechanical lubrication; J.E.S. carburetter; gear-driven magneto; single-speed gear; belt drive; Dunlop 26×1¾in. tyres.

J.E.S. Motor Works, Gloucester.—Originally designed as an attachment to

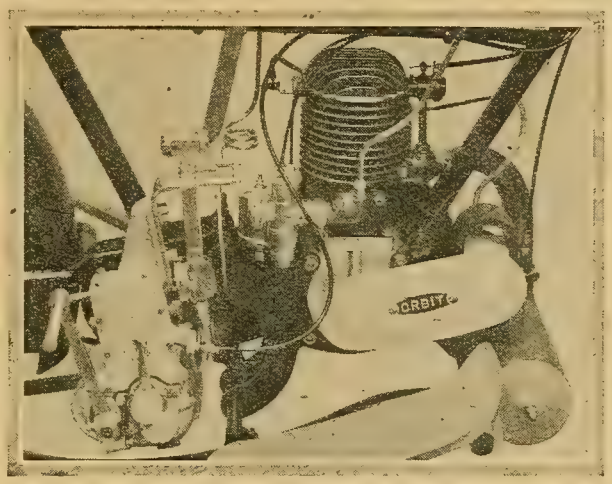
A sectioned Show exhibit of the Simplex bicycle attachment, showing the two-stroke engine clutch and magneto drive.

a pedal cycle, and still obtainable for this purpose, the J.E.S. engine is shown fitted to a specially built machine with spring forks. The power unit, although so small, is extremely interesting. A very neat automatic carburetter of small size is fitted, and the rocker gear for the overhead inlet valve is contained within the induction pipe. The valve chamber is separated from the cylinder by a large air space to assist in cooling, and mechanical pump lubrication with a large oil sump is provided. An "overhung" crankshaft is used, with a light return crank on the timing side to drive the valve gear. By undoing a few screws on the flywheel side of the crank case, the crankshaft can be removed bodily. A magneto is supported behind the cylinder and gear-driven, and the whole engine is slung within the frame by aluminium clamps. Transmission is by belt with a jockey pulley; and an XL'All saddle and Druid spring forks are fitted. As the machine is nominally an assisted pedal cycle, pedalling gear is provided, but we are informed that the excellent design of the engine makes the pedalling gear almost unnecessary.



The Brooks cantilever spring saddle is used on the A.J.S. The rear halves of the springs are concealed by the tool bags.

Besides the machine just named, the J.E.S. Motor Works are also exhibiting a 2 h.p. two-stroke of normal motor cycle build. The two-stroke engine is of their own manufacture, and is provided, like the four-stroke machine, with the new J.E.S. carburetter. The Runbaken magneto is gear-driven.

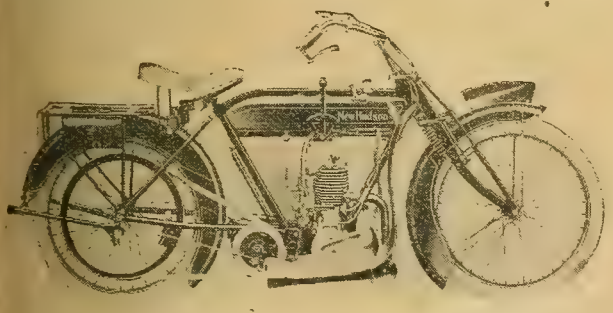


The only four-speed gear box in the Show. The Olympic lightweight fitted with a Jukes gear.

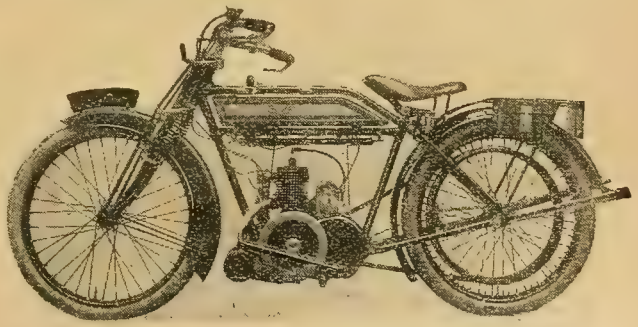
VINDEC. (191.)

2½ h.p.; 64×70 mm. (226 c.c.); single-cylinder two-stroke; hand pump lubrication; chain-driven magneto; two-speed dog clutch gear; chain and belt drive; 26×2¼in. tyres.

Brown Bros., Ltd., Great Eastern Street, London, S.E.—A thoroughly practical little mount with very pleasing outlines, the Vindec lightweight is the only 1921 model bearing this historic name. The detail finish is very good, and plated parts have been reduced to a minimum. The engine is of the conventional three-port type, but the gear box differs from general practice by reason of the fact that no spur gear wheels are used. A chain from each side of the engine drives sprockets on a shaft, and either may be dogged to the member upon which is carried the pulley for the final drive.



Equipped with neat leg guards and large footrests, this little New Hudson is attracting much attention from business men.

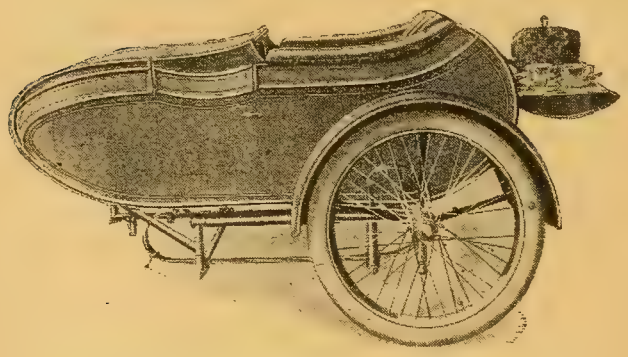


An old name and a well-known firm are associated with the 2½ h.p. Vindec.

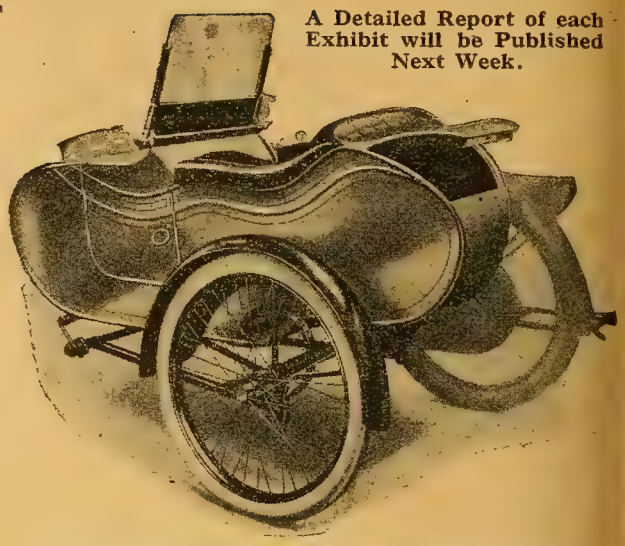
SIDECAR DESIGNS AT THE SHOW.

Passing Impressions of Latest Sidecar Practice.

A Detailed Report of each Exhibit will be Published Next Week.



A hinged dash and bulbous back are features of this Rideasy sidecar; incidentally the lid of the locker serves as an admirable picnic table.



Lightness of chassis construction is not sacrificed in the Montgomery-de-Luxe touring sidecar, despite the full equipment.

SIDECAR construction has progressed along steady lines for a number of years, and with one or two exceptions no startling constructional innovations have been introduced this year.

Perhaps one of the most noticeable features is that the fixing of mudguards to a rigid part of the chassis is rapidly going out of fashion, attachment to the body being in greater favour. This system has been used largely by the makers of the Sheffield Henderson sidecars, who adopt it on all models, and the same may be said of the touring Canoelet. The New Scale, the 3½ h.p. Sunbeam, the 7-9 h.p. Rudge, the Millford Rock, and the spring wheel Grindlay sidecars are all equipped in the same way. This is a feature which eliminates one of the most troublesome items connected with the attachment.

Extra Seating Accommodation.

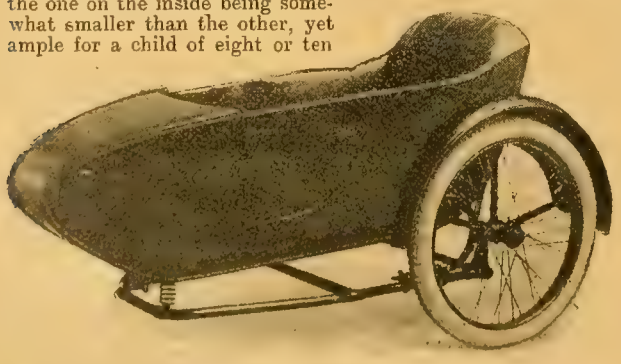
Many sidecar manufacturers are apparently realising that there is a great demand for bodies which will accommodate more than one passenger; indeed, there has always been a steady and largely unsatisfied market for a passenger attachment which would seat a child in addition to an adult passenger. Now that the power of the A.J.S. machine, for instance, has been increased, we find that a detachable dickey seat is exhibited which can be secured on a slightly lengthened luggage grid of the standard pattern; this appears a very sound means of providing for a child passenger. Dunhills, Ltd., approach the problem in another way, since one of their bodies is widened so that it makes use of the space usually wasted between the sidecar and the machine. This widened part of the body has two seats slightly staggered, the one on the inside being somewhat smaller than the other, yet ample for a child of eight or ten years. The Canoelet, Grindlay, Watsonian, and Rex sidecars also have folding seats at the rear, while the Millford family model has a body of sufficient length to take a small seat in the front part, this being supplied with the sidecar.

Spare Wheel and Luggage Carriers.

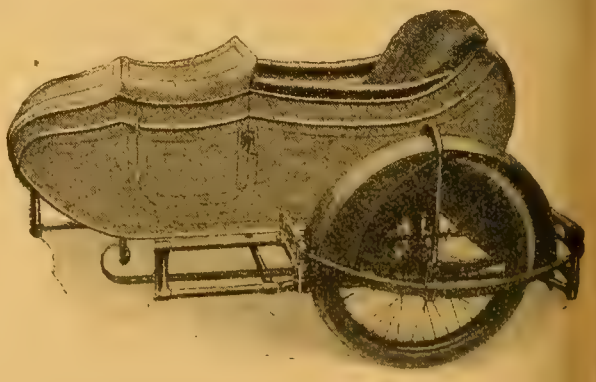
Last year the feature of the Show was the number of sidecar luggage grids which were sprung with the body, and these, of course, have become the accepted practice during the last twelve months. A slight variation of this arrangement is seen on the Triumph Gloria chassis, on which the luggage grid is separately sprung. Various arrangements are used for supporting spare wheels, which are now part of the equipment of the majority of the high-powered outfits, but it is rather disappointing to notice in many cases that no provision is made for keeping the wheel itself stationary upon its bracket; amongst those which may be excepted from this criticism is the Royal Ruby, the spare wheel carrier of which has a dog engaging with the driving dogs of the wheel, and so preventing it idly rotating when it is not in use.

The Springing of Sidecars.

It might have been hoped that more development in the direction of complete chassis springing would have been observable, but with the outstanding exception of the Millford Rock there are no new systems of wheel springing to be seen. The attachment just mentioned is, of course, unique, in that it has no chassis properly so called, but merely consists of a swinging cranked axle mounted in bearings beneath the specially strengthened floorboards of the

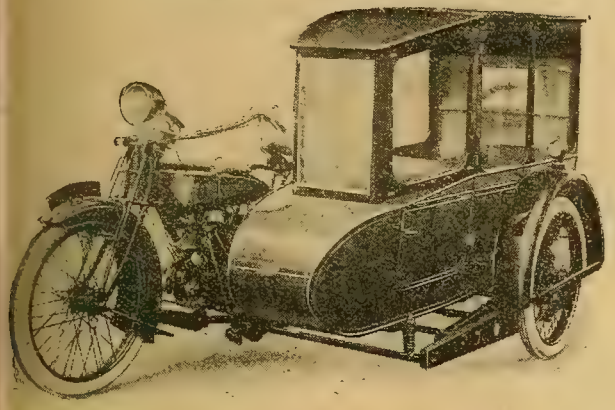


Though suitable for low-powered machines, the Royal Leicester lightweight model has a comfortably upholstered body.

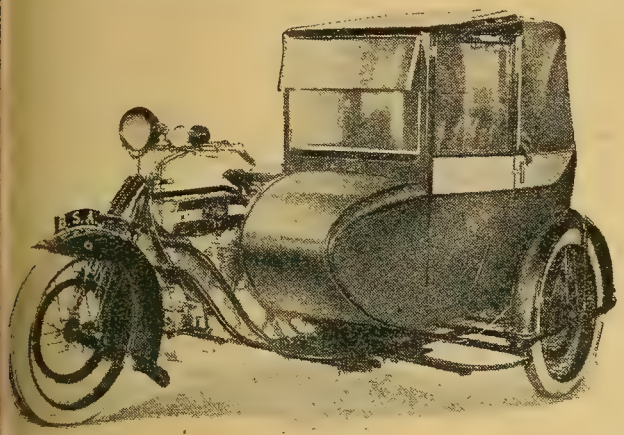


Laminated semi-elliptic springs support the wheel of this luxurious Sandum model.

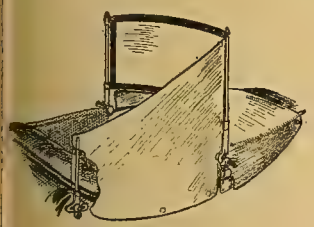
TAXI SIDECARS ARE A FEATURE.



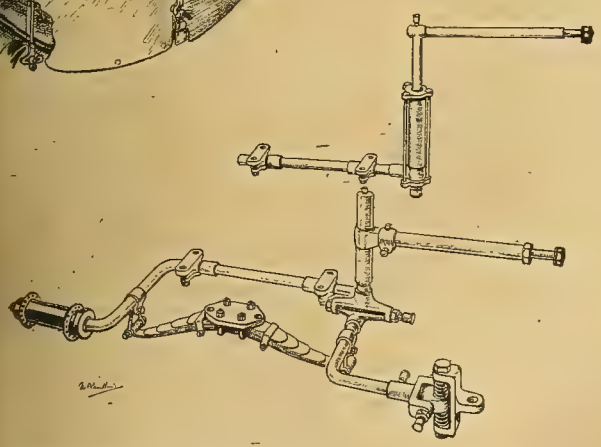
Staggered seats with a space for luggage are features of the Rex taxi sidecar. The engine is an 8 h.p. Blackburne.



The possibilities of the sidecar are amply demonstrated at this year's Show. The example illustrated is the double-seated Canoelet fitted to a twin-cylinder, three-speed B.S.A.

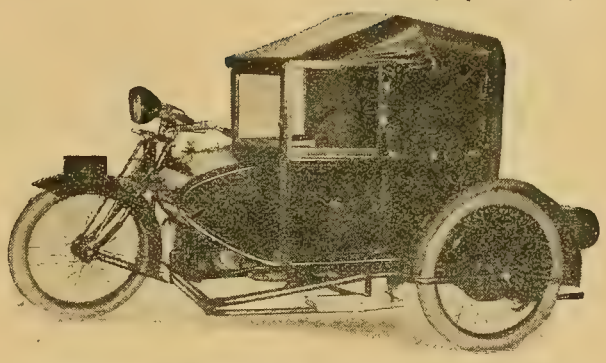


For sidecars the Cameo curved windscreen, apron, and side curtains afford excellent protection.

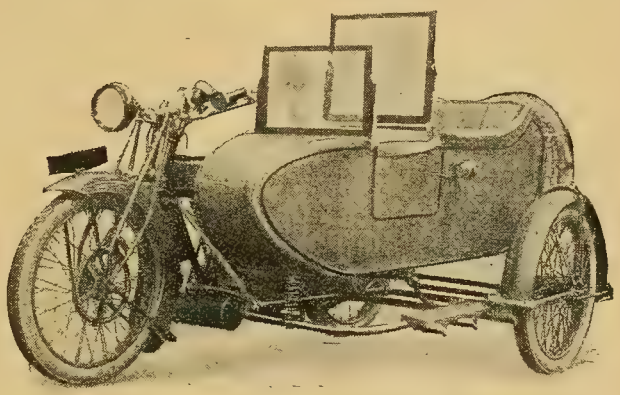


Shock absorbers, special joints and a transverse spring are features of the Millford Rock "chassisless" sidecar.

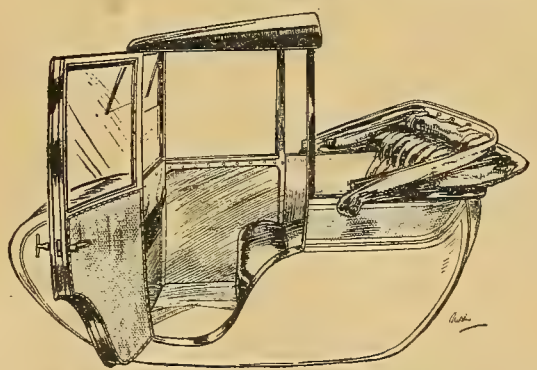
The Olympia Show.—



Nottinghamshire readers will be familiar with the 8 h.p. Campion taxi sidecar, as it has appeared on the streets of the Notts capital for months past.



Threequarter view of an 8 h.p. Matchless, fitted with a double seated sidecar. The new front wheel band brake will be observed.



This cabriolet Canoelet sidecar taxi is designed to defy the weather

Millford tandem-seated sidecar, one of a variety of sidecar models exhibited by Mills-Fulford.

body, and a front connection which is capable of vertical movement and a slight amount of radial action. Special claims for this construction are that the comfort is greatly increased, and that shocks are not transmitted from the sidecar axle to the motor cycle itself. While dealing with spring-wheeled sidecars, of course, we must not forget such satisfactory and well-tried examples as the Grindlay, Sheffield Henderson, Bat, Matchless, Clyno, Royal Ruby, and Triumph Gloria; incidentally, the latter has been somewhat simplified.

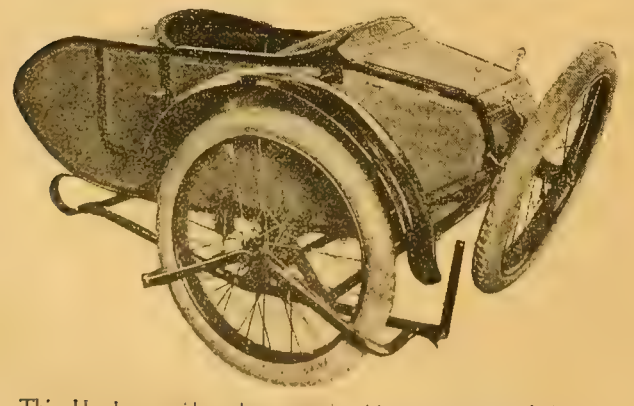
Special Models.

Apart from the touring patterns, there are, of course, the usual examples of special construction, such as ultra light sporting attachments and highly elaborated exhibition bodies; the latter, of course, sometimes appear overdeveloped, and possibly are not made for serious use under all sorts of weather conditions, nevertheless they are satisfactory examples of the coachbuilder's art. Amongst the sporting models may be mentioned the Royal Leicester in polished aluminium; also the Montgomery, Grindlay, and Canoelet. The last named, which is more than well known, is shown equipped with a torpedo apron and celluloid screen, in addition to the detachable backrest, which all contribute to the comfort of the passenger.

An unusual method of chassis construction is seen in the U.A.C. sidecar attached to a Blackburne machine. Its appearance is very reminiscent of the tubular construction used in certain aircraft work, and a very complete system of triangulation is followed.

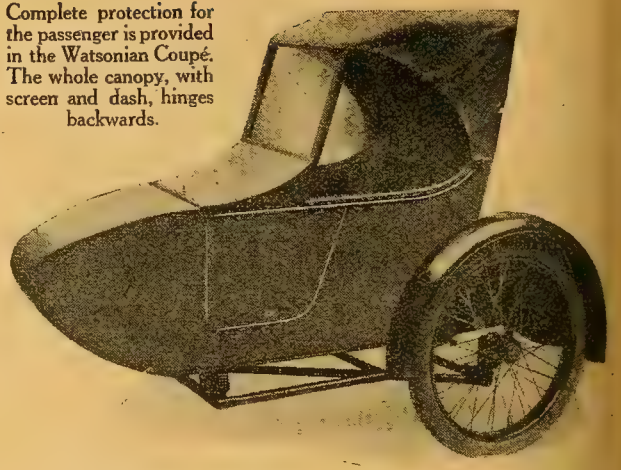
Sidecar Taxicabs.

As an example of the way in which the sidecar outfit has established its position as a perfectly reliable vehicle, we may point to the many efforts which are being made to produce a satisfactory sidecar-taxicab. Many designers are endeavouring to comply with the legal requirements involved, and two examples are shown on the stands of



This Henderson sidecar has exceptional luggage accommodation. The lid of the compartment serves as a luggage platform.

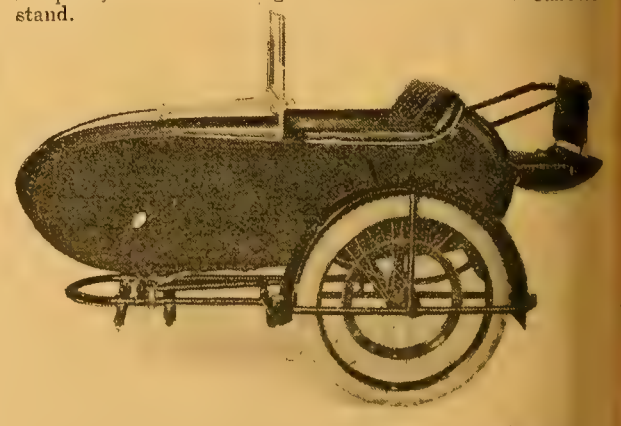
Complete protection for the passenger is provided in the Watsonian Coupé. The whole canopy, with screen and dash, hinges backwards.



prominent sidecar manufacturers. These are the Canoelet and Watsonian, and both of them would appear to answer all requirements; in addition, the Rex, Martinsyde, and Campion all stage complete taxi outfits. An ordinary two-seater touring sidecar is shown by Mills-Fulford. This is mounted on a standard chassis, and is not unduly long, since only one door is fitted, and access to the rear seat is gained by swinging aside the front seat and backrest.

Accessories and Fittings.

There is a growing tendency on the part of sidecar manufacturers to incorporate their own fittings, such as hoods and windscreens, despite the fact that many excellent devices of this nature are already on the market. Worthy of special comment in this direction are the V-shaped screens shown on the C and M sporting model, and also that on the British Excelsior. A novel type of windscreen is also shown on the Canoelet Model T. This has a celluloid sheet held in a leather frame curved to correspond with the fore part of the sidecar. At the outset it is carried on a vertical swivelling rod attached to the door, so that the opening of the latter swings the screen aside, thus permitting of ready access. Another small refinement which is found on a great many sidecars is a step which adds greatly to the passenger's convenience. Examples of these are seen on the Beardmore-Precision, which has a spring chassis, the Harley-Davidson, the Ariel, and the C. and M. On the luxurious Grindlay spring wheel sidecar the step is secured to the body; this is rather unusual. Amongst manufacturers of proprietary sidecars there does not appear to be much effort to produce an attachment which may be readily used with any of the more powerful machines equipped with detachable and interchangeable wheels, and at the same time allowing for interchangeability of the sidecar wheel. This, however, has been done in the case of the Sheffield Henderson (special Elite model), which can be adapted to take any of the standard types of interchangeable wheels, and a special bracket is provided for the spare; a similar arrangement is shown on the Canoelet stand.



A dickey seat and streamline dash, with screen, are features of this Canoelet.

In answering this advertisement it is desirable to mention "The Motor Cycle."

RUNABOUTS AT OLYMPIA.

Latest Examples of Three-wheeled Passenger Machines available in 1921.

CASTLE-THREE (42.)

10 h.p.; 62×100 mm. (1,207 c.c.); four-cylinder water-cooled four-stroke; side-by-side valves; pump and trough lubrication; Solex carburetter; Watford silent chain-driven magneto; two-speed and reverse epicyclic gear; shaft drive; 710×85 mm. tyres. Price £295, including dynamo and spare wheel.

CASTLE MOTOR CO., LTD., Kidderminster.—The Castle-Three runabout is one of the most elaborate and refined three-wheelers ever built, and, except for the single rear wheel, its specification is almost identical with that of a small car. The exhibit comprises a stripped chassis and a very handsome model with primrose coachwork and black wings. It weighs 10 cwt. complete. The man who contemplates purchasing a vehicle of this type will desire to satisfy himself that it is comfortable, substantial, and accessible. These three points appear to have been admirably safeguarded. The front springs are quarter-elliptics, rigidly bolted to the axle and the frame, while the rear springs are semi-elliptics, 40in. long, and practically flat when under load. The pressed steel frame is an index to the general sturdiness of the design. Accessibility is most carefully attained. The four-cylinder engine, which is bolted to a sub-frame, can be lifted out after four bolts have been removed. The gear box is rapidly detachable, the lower half of the casing remaining permanently in position so that alignment cannot be lost. The rear wheel can be withdrawn through the lid of the tail box in less than a minute, and all three wheels are interchangeable.

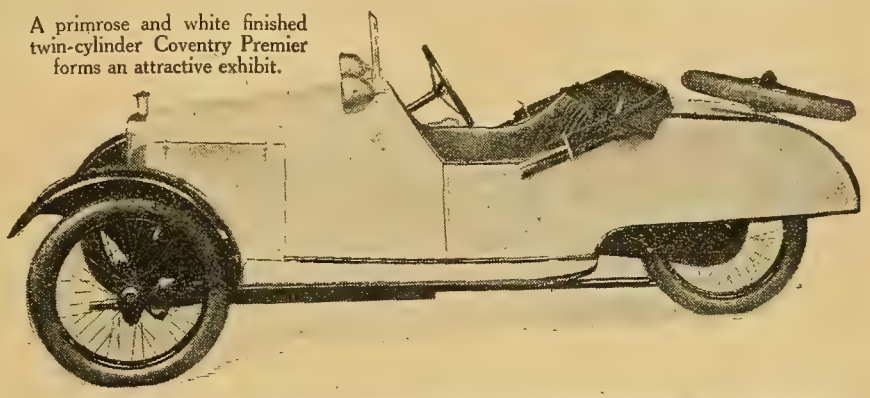
Details of special interest are the Ford-type steering gear, with a simple adjustment for rake on the column. The gear box is epicyclic, two forward speeds being operated by a combination of the gear lever and a pedal. The petrol tank can be removed by unscrewing two bolts. Lubrication is by pump and trough, a level tap being provided on the crank case and a pressure gauge on the instrument board. A consumption of forty-four miles to the gallon is claimed.

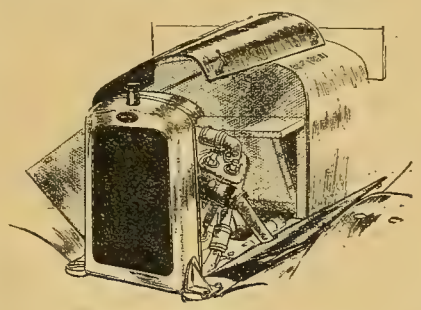
COVENTRY PREMIER. (94.)

8-10 h.p.; 80×105 mm. (1,055 c.c.); twin-cylinder four-stroke; side-by-side valves; pump and splash lubrication; Cox-Atmos carburetter; bevel-driven magneto; three-speed and reverse gear; shaft and chain drive; 700×80 mm. tyres; dynamo lighting. Price £288 15s.

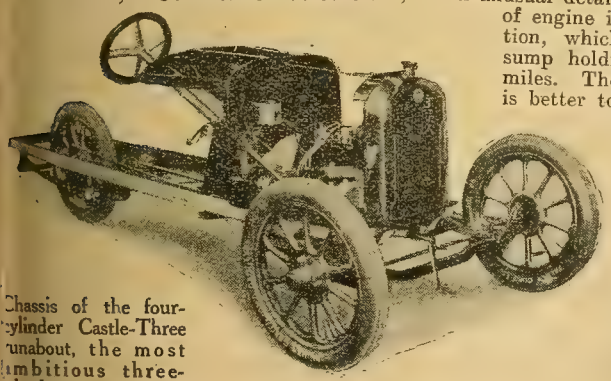
COVENTRY PREMIER CO., Coventry.—The Coventry Premier super-runabout occupies a position intermediate between the Morgan and the Castle Three in respect of elaboration. For example, it combines a three-speed and reverse gear box with a twin-cylinder V engine. The exhibit comprises a stripped chassis and two handsome touring models finished in primrose and grey respectively. The substantial construction of the frame is worthy of notice, channel steel side members being diagonally trussed by steel tubes welded into the shape of an X. An unusual detail for a motor cycle type of engine is the automatic lubrication, which is by pump from a sump holding enough oil for 175 miles. The designer holds that it is better to guard against lubrication failures by first-class workmanship than to fit a messy indicator on the dash. The machine weighs about 7 cwt., and does 55 m.p.g. The rear springing is unusually sensitive, the rear frame being hinged at the axis of the sprocket, and damped by quarter-elliptic springs built up of many thin leaves. Chain adjustment is performed by eccentrics at the front pivot of the rear frame. In considering the price it is necessary to remember that a spare wheel and dynamo lighting are included. On the other hand, the front and back wheels are not interchangeable. The back wheel has a knock-out spindle, the off side end of which is reached through a sliding panel in the chain case. The brake adjusters are of the perforated yoke type, which is becoming almost universal on cycle cars, the link pin being fitted in one of several pairs of holes drilled in the yoke.

A primrose and white finished twin-cylinder Coventry Premier forms an attractive exhibit.





Three pieces are used in the Coventry-Premier bonnet, the sides being hinged from the chassis, while the top is held on by spring clips.

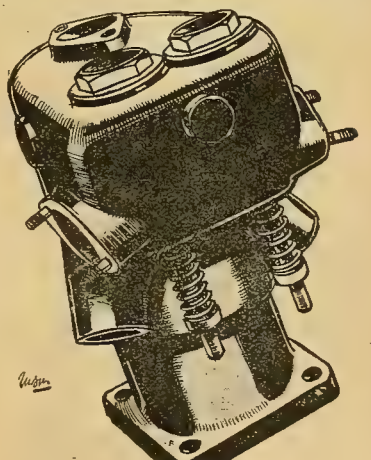


Chassis of the four-cylinder Castle-Three runabout, the most ambitious three-wheeler at Olympia.

L.S.D. (40.)

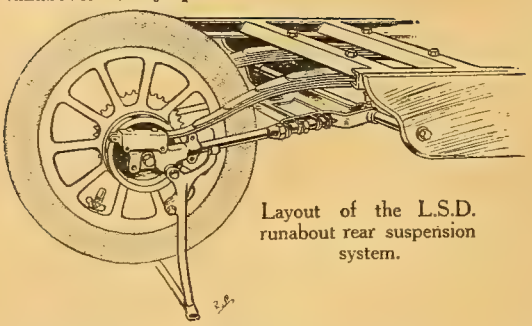
8 h.p.; 85.5×85 mm. (976 c.c.); V twin-cylinder four-stroke; side-by-side valves; splash lubrication; Amac carburetter; gear-driven magneto; two speeds forward and reverse; shaft and chain drive; 700×80 mm. tyres. Price £235.

SYKES AND SUGDEN, LTD., Linthwaite, Huddersfield.—The L.S.D. exhibit comprises a bare chassis, a touring model, and a light delivery van, both touring and van bodies being finished in a pleasing shade of dark green. Huddersfield



Careful disposition of ports and connections on the Coventry Premier V twin engine allows interchangeability of the cylinders

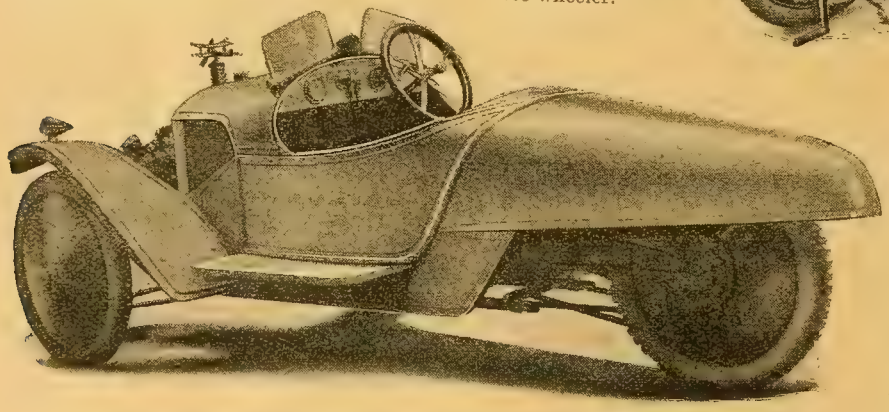
Runabouts at Olympia.



Layout of the L.S.D. runabout rear suspension system.

is the birthplace of this machine, and competitors in the 1920 Six Days will recognise that a three-wheeler which does not fall to pieces in the Huddersfield district will stand up anywhere. It is claimed by the makers that they have been unable to damage their chassis by any ill-usage to which the roads round its home can subject it. At the rear the springs are long quarter-elliptics sliding in grease boxes at the ends; the front springs are of the enclosed helical type, packing being used to give a certain additional pneumatic effect.

The method of detaching the rear wheel is ingenious. On the spindle nuts being removed a small plate, machined with one flat side, is withdrawn from each end of the axle, and allows the wheel to drop out; the brake connections must previously be released, but this is a simple matter, as the link pin is secured by a spring clip. A motor cycle type of stand is used for raising the rear wheel so that no jack need be carried. Gear control is unusual and quite foolproof; reverse is operated by a separate lever. Good provision is made for the various adjustments which may be necessary, the rear chain being set by means of substantial radius rods. The touring body is roomy and comfortable; entry is easy and convenient, a point overlooked on not a few three-wheeled designs. The weight of the complete touring model is given as 7 cwt., and up to sixty miles per gallon has been attained on test. Sankey steel artillery wheels are used, and are shod with 700 × 80 mm. tyres, and a J.A.P. 8 h.p. engine is installed to provide the motive power of this ruggedly constructed three-wheeler.



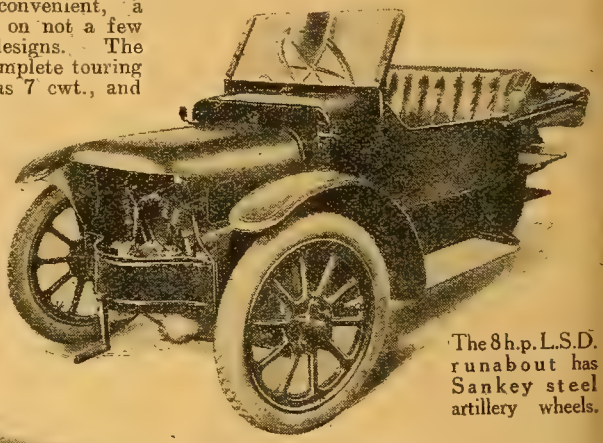
Aero model Morgan Runabout having a polished dashboard with flush fitted instruments and twin windscreens.

MORGAN. (93.)

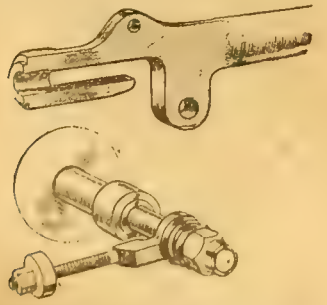
8 h.p. J.A.P., 10 h.p. M.A.G.; 82× 102½ mm. (1,100 c.c.); two-cylinder four-stroke; J.A.P. side-by-side valves, M.A.G. overhead inlet valves; splash lubrication; Amac and B. and B. carburetters; gear-driven magneto; two-speed Morgan gear; shaft and chain drive; 700× 80 mm. tyres. Price sports model £206; family model £235.

Morgan Motor Co., Ltd., Malvern.—The Morgan comes to the Show with an extraordinary run of post-war competition successes to its credit, gained by over thirty different drivers, which shows that private owners as well as trade drivers, can win medals on Morgans. The exhibit comprises a water-cooled chassis and six different examples of the complete models, of which special interest is evinced in the grey sporting model and the royal blue four-seated family machine.

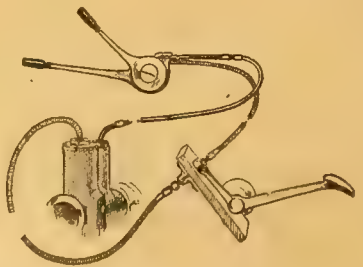
The merest glance at the chassis will indicate what a high value the designer places upon simplicity and light weight as compared with other designers of three-wheelers; the chassis still scales less than 3 cwt. As the machine has been practically invincible in its class for several years, few alterations have been found necessary. The most important consists of facilities for removing the rear wheel. Mr. Morgan prefers to rely on a vertical slot in the rear fork ends through which the rear spindle can always be freed from the draw-bolt slides. Both chains now contain the same number of links, so that they can be changed over to equalise wear. The pivot spindle of the rear forks is mounted on cones which are rapidly adjustable if any shake should develop in the rear frame. Provision is made for mounting a dynamo with adjustment for the Whittle belt. A four-speed gear is now listed as an option, at a price of £20. Either J.A.P. or M.A.G. engines may be fitted, and in future the driving chains will be interchangeable to equalise wear. Many variations of the popular Morgan are obtainable, but all follow the same clean and simple lines indicated above.



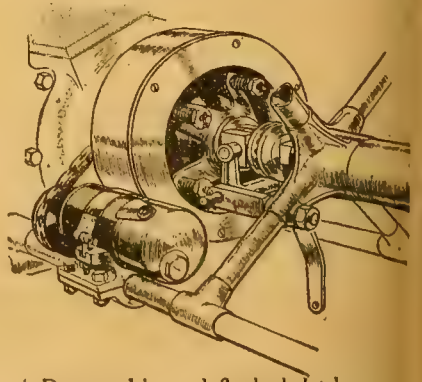
The 8 h.p. L.S.D. runabout has Sankey steel artillery wheels.



A modification of the Morgan rear-fork end permits the wheel to be removed without uncoupling the chains.



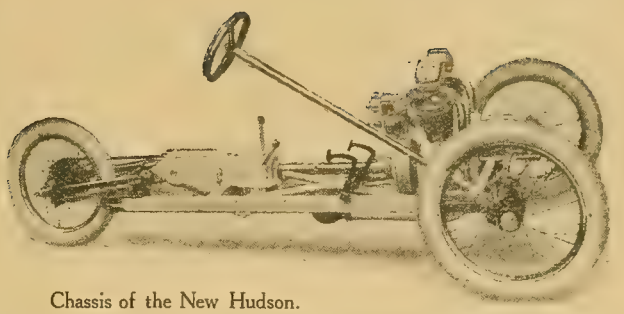
Foot and hand control provided for the throttle of the Binks carburetter on the Morgan Runabout.



Dynamo drive and flywheel clutch on the latest Morgan Runabout.

Runabouts at Olympia.

The clean broadside of the new 10-12 h.p New Hudson runabout.

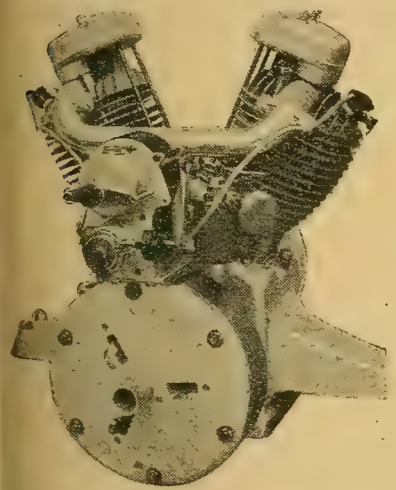


Chassis of the New Hudson.

NEW HUDSON.

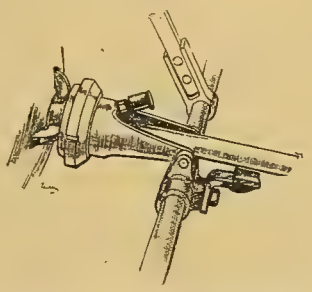
10-12 h.p.; 85×110 mm. (1,250 c.c.); twin-cylinder four-stroke; overhead valves; Benton and Stone lubrication; B. and B. carburetter; chain-driven magneto; three-speed and reverse New Hudson gear; shaft and chain drive; 700×80 mm. tyres. Price £250.

New Hudson, Ltd., St. George's Works, Icknield Street, Birmingham.—The three-wheelers on the New Hudson stand are one of the chief attractions of the Show, several complete vehicles being staged, together with two stripped chassis, engine, and a rear frame. The



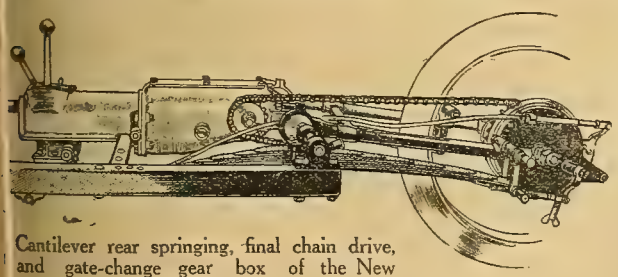
The engine has overhead valves, and is rated as 10-12 h.p.

nachine is a notable addition to its class, ombining obvious strength with a high legree of refinement and surprisingly low rice. The chassis is on rugged and imple lines, consisting primarily of two erfectly straight channel steel side iembers connected by a channel steel ross member in front of the engine, and nother channel cross member under the gear box. These cross members are braced by two steel tubes welded at their points of intersection. Mounted in brackets at the rear end of the main frame is the tubular member on which the rear forks are located. The front springing is by quarter-elliptics rigidly bolted to the axle and frame, and rear springing is carried out by extremely long cantilevers. The 1,250 c.c. engine, which is New Hudson manufacture throughout, is a 50° twin mounted on the chassis by brackets cast integral with the crank case. Radiating fins on the cylinders are of exceptional depth; detachable heads are secured by three bolts apiece. All valves are overhead, the rocker gear being encased in aluminium oil boxes. Between the angle of the cylinders lies the camshaft, and a Lucas Magdyno is driven directly off the rear end. Driven by silent chain with idler adjustment, the starting handle engages the front end of the camshaft.



A clutch stop operates on the underside of propeller-shaft of the New Hudson three-wheeler.

A single-plate Ferodo-faced clutch is used, from which the drive is taken by a shaft to a three-speed and reverse gear box and bevel gear. The final drive is by chain, tension being readily maintained by means of double eccentrics. Steering is by rack and pinion neatly mounted inside the channel of the front cross member of the frame. Both brakes are on a single drum on the rear wheel, the foot brake being internal, while the hand brake is of the calliper contracting pattern. The rear wheel is detachable, a distance piece being integral with the knock-out spindle under a special New Hudson patent. The top and middle gears engage by dog clutches, the first and reverse gears being operated by sliding pinions. A flexible steel universal joint is mounted on the rear end of the clutchshaft. Brake and gear levers are centrally disposed. The complete cars are of very taking appearance, with capacious bodywork finished in dark blue, electric grey, and stone colour respectively. A dummy radiator of perforated metal fills up a nickel-plated shell of pleasing aspect. A low single panel windscreen is mounted on the top of the shallow facia board. The instrument board carries the ignition, Magdyno switches, and the lubricator. Engine control levers are mounted beneath the steering wheel. A roomy tool-box is provided in the tail, and there are two lockers under the seat, one of which is occupied by the accumulators.

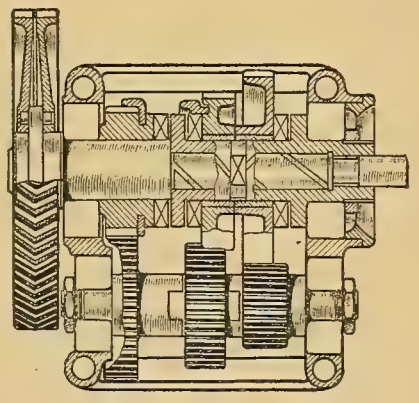


Cantilever rear springing, final chain drive, and gate-change gear box of the New Hudson.

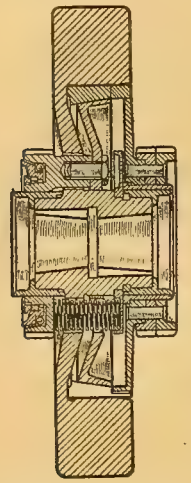
SCOTT SOCIABLE. (19.)

5 h.p.; 76.2×63.5 mm. (578 c.c.); twin-cylinder two-stroke; petroil lubrication; Zenith carburetter; gear-driven magneto; three-speed Scott gear; shaft and bevel drive; 700×80 mm. tyres. Price 260 guineas.

Scott Autocar Co., Ltd., Bradford.—The immense interest shown in the Scott Sociable is enhanced by the fact that it is known to have had several years' testing on the road. Its most interesting feature is the complete protection which it offers the driver from bad weather, whilst those who have driven in it assert that it is more comfortable than many cars. It certainly took some of the rough climbs in this year's Six Days Trials more convincingly than most of the passenger



Part sectional diagram of the Scott Sociable gear box.



Sectional view of the flywheel and clutch of the Scott Sociable.

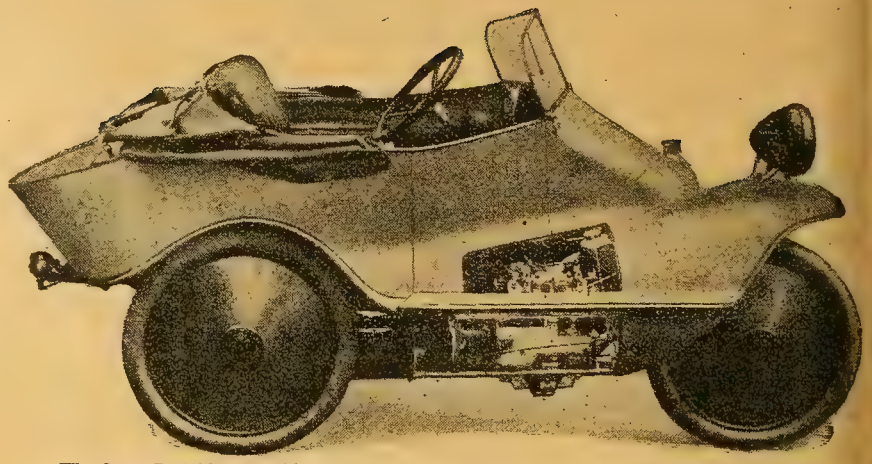
entries. The technical details of the machine have recently been fully illustrated in *The Motor Cycle* (October 20th), and visitors to the Show spend most of their time examining the details from an owner-driver's point of view with an eye to maintenance.

The engine is invisible, but can be completely uncovered by pulling down the slide above it and removing the lower cover. There are only three greasers on the chassis. The gear box is lubricated by engine oil at long intervals, and the bevel casing by grease. The brake adjustments are simple, and the brake bands, being of the internal pattern, can be renewed in a few minutes after the wheels have been detached. The entire power unit is attached by four nuts. Complicated as the chassis may appear at first sight, it presents no job which the average owner-driver cannot perform with ease. Many of the detail fittings of the chassis deserve close attention—for example, the clear vision windscreen, the method of storing the spare wheel, the door catches, the hood attachment, and the dickey seat. A speedometer is fitted as standard, and driven off the near side wheel Accumulators are used for lighting, no dynamo being fitted to the present model. The side lamps are very neatly sunk in the dash.

STANHOPE. (144a.)

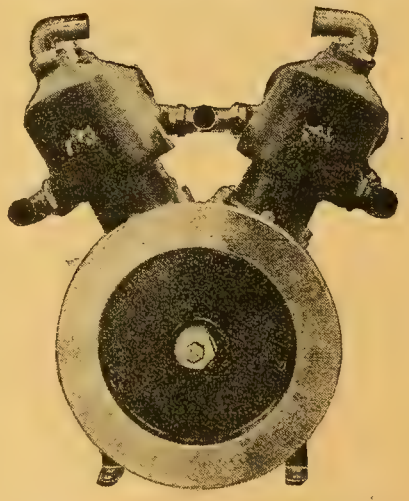
8 h.p.; 85.5×85 mm. (976 c.c); two-cylinder four-stroke; side-by-side valves; splash lubrication; B. and B. carburetter; gear-driven magneto; two-speed gear; belt drive; 700×80 mm. tyres.

Stanhope Motors (Leeds), Ltd., Dixon Lane, Lower Wortley, Leeds.—The Stanhope three-wheeler is unique in its class as being the only survivor with one combined driving and steering wheel in front and two trailing wheels behind. The details of the front wheel mounting



The Scott Sociable in its Show guise attracts much attention, notwithstanding the fact that it is located under the Gallery.

deserve close attention. Its bearing is pivoted in the middle of a long fixed axle, and the wheel is steadied by guides on rollers which are carried in a fork on a sleeve fixed to the axle. The entire layout is extremely ingenious, and the steering appears to be light. The front



10 h.p. water-cooled Blackburne engine used on one of the T.B. three-wheelers.

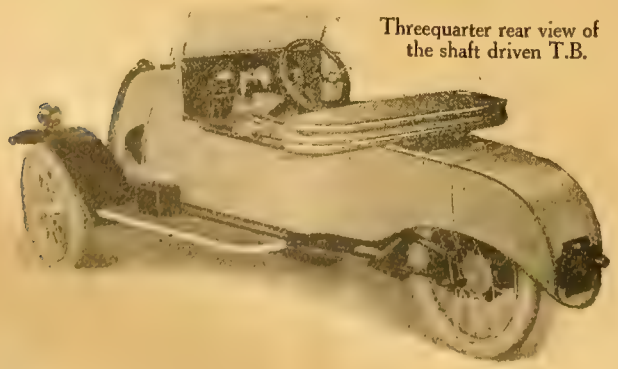
springs are quarter-elliptics bolted into slots in the end of the fixed axle. The rear axle is solid, carried on cantilever springs. One advantage of having two wheels at the stern of the chassis is that it is easier to fit a broad or heavy body without suffering from roll, and a really imposing light delivery van body is shown mounted on one of the chassis. There does not appear to be any very striking reason why the drive should not be taken to the rear axle, beyond that of saving weight. Two Whittle belts on variable pulleys provides a good range of gear ratios. The exhibit comprises a stripped chassis, a two-seater touring model, and the large delivery van already mentioned.

T.B. (31.)

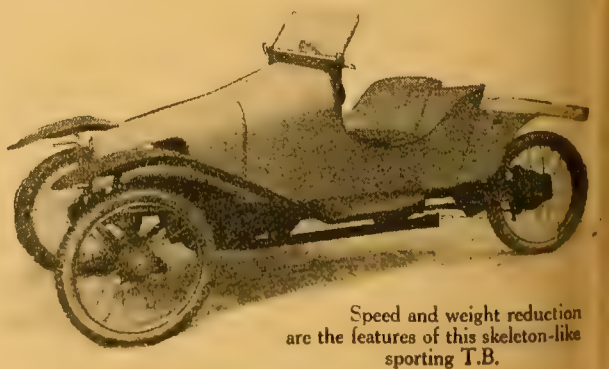
8 h.p. J.A.P.; 85.5×85 mm. (976 c.c.); twin-cylinder four-stroke; side valves; splash lubrication; Amac two-lever carburetter; chain-driven magneto; three speeds and reverse; sliding gear; shaft drive; 700×80 mm. tyres. Price £240.

Thompson Bros. (Bilston), Ltd., Bradley Engineering Works, Bilston.—Here is staged one standard chassis, together with complete samples of the three models in which the T.B. cycle car is manufactured, viz., the 10 h.p. air-cooled touring, 10 h.p. water-cooled touring, and a very racy little 8 h.p. vermilion sports model.

Cycle car enthusiasts should devote close attention to the constructional details of this vehicle, which has been painstakingly elaborated to stand up on the abominable roads round Bilston, and should prove as near fracture-proof under hard service as is possible. The manufacturers' experience in aeroplane work is suggested by the layout of the



Threequarter rear view of the shaft driven T.B.



Speed and weight reduction are the features of this skeleton-like sporting T.B.

NEW METHOD OF LEARNING FRENCH

LATEST ACHIEVEMENT OF PELMAN INSTITUTE.

"Do you think that you could pick up a book of four hundred pages, written in a language with which you are unacquainted—say Spanish or Italian—and containing no English words at all, and read that book through without having to refer once to a dictionary?"

"Of course, I couldn't," you will reply, "such a thing is impossible."

Certainly, it seems impossible. Yet this is just what the new method of learning Foreign languages by correspondence, introduced by the well-known Pelman Institute, now enables you, or anyone else, to do.

An Original Method.

The new Pelman Method of Language Instruction is one of the most remarkable educational achievements of the century, and, in the opinion of those who have thoroughly examined it and subjected it to the most stringent tests, it is certain to exercise a profound influence upon the normal methods of teaching languages in this and other countries.

The French Course is now ready—courses in other languages will follow shortly—and is described in a little book entitled "How to Learn French," which will be sent free to any reader of *The Motor Cycle* on application to the address given below.

The Pelman Method is based on an entirely new principle. It is a simple method. It presents no difficulties of any sort, and the very first lesson of the French Course will amaze you. There is not a word of English in this lesson, yet you can read it with ease, and you could do so even if you didn't possess the slightest previous knowledge of French. It sounds almost incredible, but it is perfectly true.

No Vocabularies or Translation

By following this method you can learn French in about one-third the time usually required. The progress made, even by those students who have had no previous acquaintance with the language, is rapid, and by the time you have completed the Course you will be able to read any French book or newspaper, and to speak French more fluently than can the average student who has learnt French for years in the ordinary way. And you will attain this proficiency without having to spend hours, days, and months studying complicated and dreary rules of grammar, or memorising long vocabularies. There is no translation and no dictionary. There are no passages of French to be put into English, and no passages of English to be put into French. You learn the language in the natural way, just as you would do if you were staying in France. This, of course, makes the study extremely interesting, so much so that once you begin you will go on until you have completed the Course. By that time you will have acquired a thorough practical mastery of the language, and will be able to read, write, and speak French fluently and correctly.

Guide to Pronunciation

Another interesting feature of the Course is the Guide to Pronunciation. Hitherto this question of pronunciation has presented almost insuperable difficulties to those who have been endeavouring to learn French by correspondence. In the Pelman French Course this difficulty has been overcome by a simple and ingenious device, and with the help of this guide you will have no difficulty in acquiring a correct accent, and in pronouncing French words as they should and must be pronounced. Write to-day for a free copy of "How to Learn French" to the Pelman Institute (Modern Languages Department), 97, Bloomsbury Mansions, Hart Street, London, W.C.1.

Threeequarter front view of the Scott Sociable, a double-seated sidecar type of vehicle bristling with novel features.

This model of the T.B. runabout has a 10 h.p. water-cooled engine and a roomy and weatherproof body.

chassis, which consists wholly of straight tubes with welded joints. The engine and gear box unit can be slid out from the front with remarkable ease. Points of special interest are the weights of the different models, the sports model scaling 6 cwt., while the water-cooled touring model comes out at 7¼ cwt.

The starting handle works on the same principle as a kick-starter, being geared up 2 to 1, so that a girl should be able to start the engine. The provision of a reverse gear is noticeable. There are no shackles or greasers on the front springs, which are rigidly bolted at both ends, a safety leaf being fitted. The rear springs are of the full cantilever type. The back wheel can be taken out in five seconds, and the load is not taken by the spindle but by the distance pieces. All three wheels are interchangeable. The steering column is telescopic to permit of adjustment for tall or short drivers. Should any purchaser of an air-cooled model develop a preference for water-cooling, the conversion can easily be made, since a water-cooled core can be fitted inside the dummy radiator of the air-cooled models. Provision is made for fitting a Lucas lighting dynamo.

CLUB NEWS.

Surbiton and District M.C.C.

The active Surbiton and District M.C.C. is holding its annual dinner at the Holborn Restaurant on December 15th at 6.30 p.m., morning dress to be worn. Tickets for the dinner will be available at Olympia from Mr. J. A. Masters, Harley-Davidson Stand; or Mr. Kaye Don on the Avon Stand; Mr. F. W. Barnes or Mr. W. B. Reeve on Zenith Motors Stand; or from Mr. W. Pratt, Maudes' Motor Mart, 100, Great Portland Street, London, W.1.

Redditch and District M.C.C

The autumn reliability trial for members for the Wicliffe challenge cup and medals took place on Saturday, November 20th, over a course of about sixty-five miles. The results are as follows:

WICLIFFE CHALLENGE CUP AND GOLD MEDAL.—L. Sealey (3½ B.S.A. sc.).

SOLO CLASS (Silver Medal).—W. Swiffen (4 Blackburne).

PASSENGER CLASS (Silver Medal).—H. Poole (4¼ B.S.A. sc.).

BEST PERFORMANCE by member who had not won a premier award during the season in any trial (Gold Medal).—T. Hackett (6-7 B.S.A. sc.).

Sutton Coldfield and North Birmingham A.C.

Briefly described in our issue of November 25th, the results of the trial held on November 20th are now to hand and are as follows:

BEST PERFORMANCE OF DAY (Sutton Cup and Gold Medal).—J. Roberts (3 A.B.C.).

BEST PASSENGER MACHINE (Shell Cup and Gold Medal).—H. Morgan (8 Morgan).

BEST AMATEUR.—J. Roberts (3 A.B.C.).

NON-STOP PERFORMANCES AND FULL MARKS (Silver Medals).—B. Kershaw (2¾ Verus), A. W. Thrush (4 Triumph), W. H. Riley (6 A.J.S. sc.), L. Paynter (3½ Norton), F. Giles (6 A.J.S. sc.), J. New (6 Ariel), T. F. Blumfield (6 Ariel sc.), L. J. Brown (8 Acme sc.), F. A. Watson (3½ Sunbeam sc.), G. Kuhn (2¾ Verus), and B. L. Bird (2¾ Matloe).

Wolverhampton M.C.C.

A paperchase was held on Saturday, November 20th, for the Rudge Cup and other awards, including a gold medal presented by Mr. H. R. Davis. The results are as follows: 1, Rudge Cup and gold medal, W. H. Bishop (6 A.J.S. sc.); 2, Howard Davis gold medal, Miss K. Smith (8 Sunbeam sc.); 3, club gold medal, Cyril Greenwood (3½ Sunbeam sc.).

Harrogate and District M.C.C.

The annual general meeting of the above club was held recently at the Imperial Café, when a good number of members were present. The reading of the report and balance-sheet proved the club to be in a satisfactory position, with a balance in hand of nearly £30. Mr. T. Haley was elected president, Mr. H. E. Ellis captain, and Mr. J. Baxter takes up the position of hon. secretary in place of Mr. Fortune.

It is intended to organise a reliability trial for Boxing Day, and to hold a dance, etc., early in the New Year.

North Wales M.C.C.

The North Wales Motor Cycling Club held its first half-day reliability trial on November 18th. For a few miles between Cerrig and Corwen the road was like a ploughed field. The results are as follows: Special lady's prize, Miss Mildred M. Hughes (2½ Clyno); 1st, club gold medal, S. W. Smith (6 A.J.S. sc.); 2nd, club silver medal, Owen Edwards (3½ 1908 Triumph); 3rd, club bronze medal, Frank Jones (4 Verus).

For next season an attractive programme is being prepared. Full particulars are obtainable from the hon. secretary, Mr. J. Howard Davies, 1, Ruthin Road, Denbigh.

A Club for Beckenham.

It is proposed to form a motor cycling club at Beckenham, Kent. Motor cyclists in the neighbourhood who are interested should communicate with Mr. H. W. Turner, 47, Hampden Road, Beckenham.

Belfast and District M.C.

The Belfast and District Motor Club held its smoker and prize distribution on Thursday, November 25th, in the Café Royal. The club was reorganised this season after lying dormant during the war, and, although events only commenced in June, it can be said that a successful season has been experienced. The three cups, of which the B. and D. Cup is the only one for a hill-climb—the Jaffe and Premier Cups being for reliability trials—proved a good draw, and some interesting racing was witnessed at Carnmoney and elsewhere. A handsome exclusive design has been secured for the club medals, and they formed very attractive prizes. The following is a list of the principal events and winners:

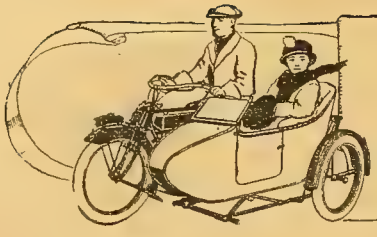
HILL-CLIMB, CARNMONEY (for B. and D. Cup), July 7th.—1 and cup, E. Thompson (3½ Rudge); 2, P. Bell (3½ Norton); 3, J. Boston (4 Triumph). Special prize for fastest time: J. W. Shaw (3½ Norton). Knock-out race: E. Thompson (3¼ Rudge).

JAFFE CUP TRIAL, July 14th.—1 and Cup, S. Wallace (8 Rex sc.); 2, E. Thompson (4 Douglas); 3, J. M'Bride (3½ Sunbeam).

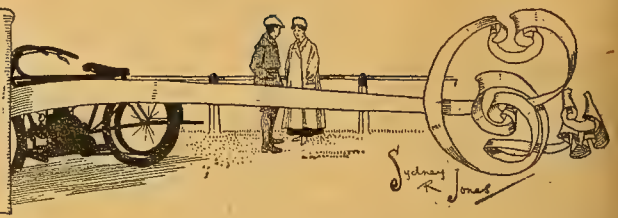
PREMIER CUP TRIAL, August 21st.—1 and cup, S. Wallace (8 Rex sc.), 2, J. Branagh (4¼ Quadrant sc.).

Bristol M.C.C.

The annual dinner of the Bristol Motor Cycle Club was held at headquarters, the Full Moon Hotel, North Street, Stokes Croft, on Saturday evening, November 20th, and proved an unqualified success. About eighty guests paraded, including several members of the Bath and West of England Motor Club.



Show Jottings.



SOME RANDOM NOTES IN LIGHTER VEIN.

IT is extraordinary that in these enlightened days some stand attendants should not know the bore and stroke of the engines fitted to their machines.

There's money in the Show! Those who talk of trade depression should go and see the Diamonds, Rubies, and L.S.D. at Olympia. Oh, there are Bradburys, too!

Which is the lighter? The heaviest lightweight or the lightest heavyweight?

One enterprising firm had its machines unpacked gratis by various pressmen.

Sidecar taxi regulations are having a considerable effect in improving front wheel brakes.

Many of the exhibits which arrived by train bore traces of the journey in the shape of damaged handle-bars and mudguards.

Some of the domed mudguards on big sidecar outfits are large enough for small cars.

A placard with the legend "Pity the poor driver" would not be out of place on some of the luxurious coupé sidecar outfits. Inside the essence of luxury; outside—well, if it rains, one gets wet.

The Olympic would naturally find a place in Olympia.

With the Red Indian and the Mohawk at the Show, all that is missing is Douglas Fairbanks as Two Gun Joe.

Olympia has quite a zoological flavour with the Bat, Wolf, Squirrel, and Whippet.

One three-wheeler actually has five wheels; for confirmation inspect the Coventry Premier exhibit.

Is it true that the miniature J.E.S. was delayed in the post? It was certainly a late arrival.

There was nearly a catastrophe on Tuesday when two healthy adults got into one of the sidecar taxis and omitted to breathe alternately!

Is it true that an ash tray is given away with every Corona?

Among motor cycles we have the Sun (including the beam); in cars the Star and the Moon, but the cycle car "Crescent" has set.

After dilating upon the remarkable power of the brakes on a certain machine, the designer was asked the advantage of fitting more than one brake to a wheel, if that brake would lock the wheel. He later sportingly admitted that the second brake was in the wrong place.

There are cigars (Coronas), as well as the usual Nuts, at the Show this year.

In view of the taxi sidecar vogue it will be necessary to quote body space in c.c. in preference to parading its loading capacity.

What with the A.J.S., F.N., C.A.V., BAT-J.A.P., B.S.A., M-L, B. and B., NUT, J.E.S., AMAC, L.S.D., L.M.C., M.A.G., P. and S., P. and M., T.B.—not forgetting the 100,000 circulation of the "M.C.," there are few letters of the alphabet left for newcomers.

What is the Kenil worth? and where has the Para gon?

During the rush on the opening days one of our staff retired for what he termed a "snack," and got little change out of a semi-Bradbury.

On going to press the following queries reach us: Who made the Tan Sad, the Sun beam, the Mag lita, and the Clay rite?

A reader asks: Since you praise the big twin James, do you consider Jimmy the lightweight champion?

Extremes meet at Olympia, there is the All-on and the Nort-on.

Really motor cycles are precious things! Some arrived at the Show wearing felt body belts, others had waterproof paper coverings, whilst those of the Elite had fancy striped flannel pyjamas.

Wanted, a name for the motor bicycle and sidecar taxi. Here are a few suggestions—others are invited: Taxicle, Tricab, Taxibus, Omnicycle, Bicab, Taxiette, and Sidecab.

A departure from the Corinthian architecture of the average stand contractor is seen at the Alecto exhibit, for the stand is surrounded by lengths of roller chain—supported in graceful festoons, between pedestals topped by two-stroke cylinders. Evidently there is no chain shortage now!

In these days of coachbuilt bodies, on even the lightest of sidecar chassis, we are apt to forget the one-time popular cane arrangements, but recollections are jogged by a single example on the Willowbrook Co.'s stand.

A rough survey shows that there is £20 difference between the cheapest and most expensive of the single-geared two-strokes.

Only one representative of the four-speed gear box remains and that is on the lightweight Olympic.

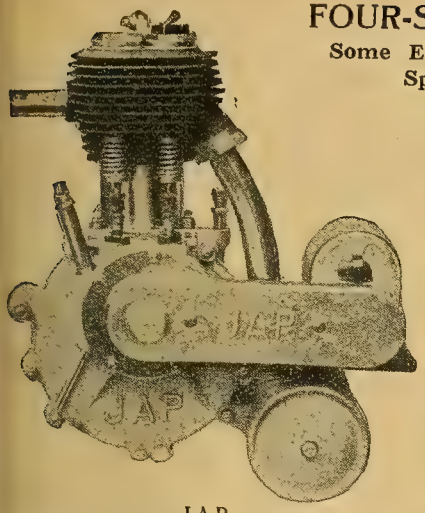
One merchant kindly promised a member of our staff to talk *for hours* on the morrow, to demonstrate the advantages of the inflator connection.

As a "wind up," a fancy dress parade is proposed for Saturday evening at the Show in aid of St. Dunstan's. Arrangements were in hand at the time this issue went to press.

The Cowey speedometer calibrated to 60 m.p.h. seems rather a luxury on the Dayton tricycle—which has a maximum speed of 11 m.p.h.

FOUR-STROKE ENGINES AT OLYMPIA.

Some Examples of Power Units produced by Engine Specialists, and fitted to Many Machines.



J.A.P.

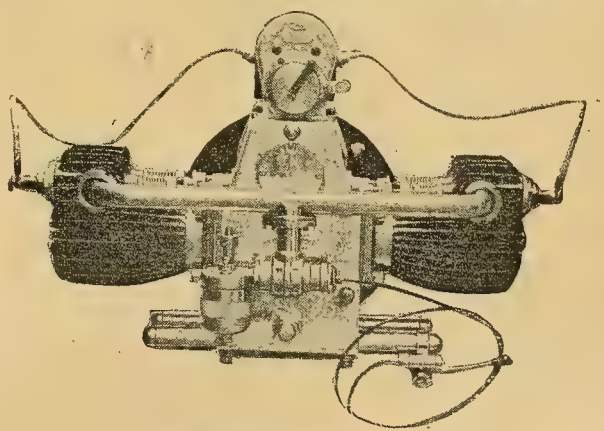
10 h.p., 82 mm. × 102.5 mm., 1,100 c.c.

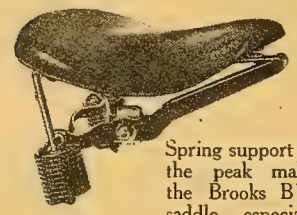
The method of driving the magneto on the 10 h.p. Blackburne, Precision, and 8 h.p. M.A.G. cycle car engines will be observed. The 10 h.p. 90° M.A.G. is also a cycle car engine.



COVENTRY VICTOR.
5-7 h.p., 75 mm. × 78 mm., 688 c.c.

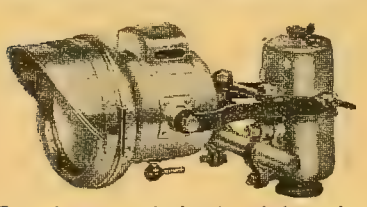
Accessories at Olympia.

In this and subsequent pages many of the useful accessories displayed at Olympia are reviewed. A further instalment will be published in next Thursday's issue of "The Motor Cycle."



Spring support for the peak makes the Brooks B175 saddle especially comfortable.

One of the several combinations of Tan-Sad Units—the cantilever spring saddle used in conjunction with the well-known pillion seat, with a tool bag at the extreme rear.



Exceptional value is the aim of the makers in introducing this well-made Millers light-weight lamp.

The Oleo plug-testing device.

The new Bowden straight-pull pedal. Behind it may be seen the Bowden master control, which allows either hand or foot operation for the clutch.

CLAYTON-WRIGHT, LTD., Birmingham (2, ground floor).—An exhibit of horns and handle-bar mirrors of exceedingly good finish. A special feature of the former is that the twists are concealed within the bell of the horn, while the latter are distinctive on account of the positive locking arrangements which secure the mirror in various positions.

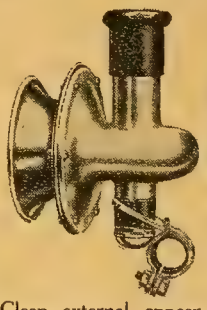
E. SHOWELL AND SONS, LTD., Birmingham (8, ground floor).—These specialists in motor cycle lubrication apparatus show examples of the Best semi-automatic drip feed oil pump and the Lamplugh mechanical lubricator, which may be driven from the timing gear of the engine; it has a variable throw for the plunger, which is controlled in conjunction with the throttle.

RUBBERINE, LTD., London, N.W. (12, ground floor).—As a means of protecting the valve stems and guides from the effects of dust and grit, and also as a guard against air leaks which will interfere with starting, some form of cover is desirable. The F.E.W. valve spring protector is an admirable device of this nature, and it entirely encloses the valve springs.

JENSON AND NICHOLSON, LTD., London, E. (14, ground floor).—Robbialac enamels are well-known to every motor cyclist who attempts to renovate his own machine. Many examples of work done, in every colour used on motor cycles, are shown. The transparent enamels for protecting plating during the winter months should also be borne in mind.

HOWARD C. COOKE, LTD., Birmingham (16, ground floor).—The Cooke plug, with its efficient Steatite insulator, is one which is so well-known that it is unnecessary to do more than mention that it is on view.

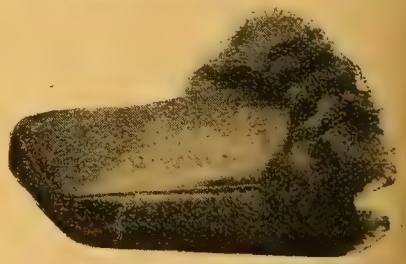
EASTING WINDSCREENS, LTD., Brimingham (154, ground floor).—As one travels the roads of this country it is impossible to ignore the fact that almost every other touring sidecar met is equipped with an Easting windscreen. This device has been further improved (in the Royal model) by the telescopic arms which carry it being hinged in a position near the dash, thus permitting the whole screen and apron to be raised, allowing the passenger to enter without the necessity of disturbing the adjustments in any way. The screen may be raised or lowered to almost any extent, so that it is either below the passenger's view or is erected to form an absolutely weather-proof canopy. A lightweight model is also being made.



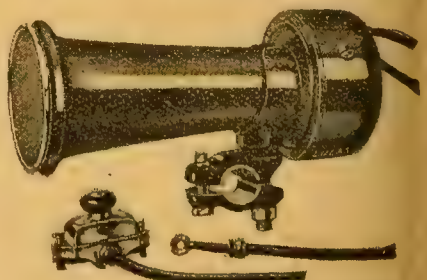
Clean external appearance of the Cowey horn does not belie the efficiency of its mechanism.

Supplied in either nickel or all-black finish, this Cowey handle-bar watch has a special movement to withstand vibration.

A foot-warmer by Messrs. Dunhill, Ltd., a useful accessory for the sidecar.



Another foot-muff marketed by Messrs. Dunhills, Ltd., which will be highly appreciated by fair passengers during the cold weather.



An optional addition to the Magdyno or dynamo lighting set, the Lucas electric horn which may be used also in conjunction with accumulator equipment.

Accessories at Olympia.—

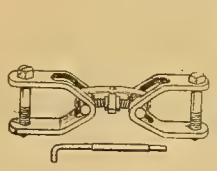
OLLARD, WESTCOMBE AND Co., Birmingham (156, ground floor).—Amongst the pioneer makers of protecting devices for sidecar passengers, the Cameo windscreen must not be overlooked; its neat appearance commends it, while the detachable apron and side curtain guard against the ingress of rain at the front and deflect currents of air at the side.

HANS RENOLD, LTD., Manchester (221).—As pioneers of chain drive, the house of Hans Renold has attained an unassailable position. Despite the satisfactory service which has been obtained in the past, efforts towards improvement have not been neglected, and it is noteworthy that the ultimate braking load of the ½in. pitch chains has been increased from 2,500 lb. to 5,000 lb. A new type of spring clip connection is being introduced for the roller chain, but it will not come into universal use until early in next year. Advantages claimed for it are that it cannot be thrown off or broken at high speeds, and it is, therefore, admirably suited for racing machines. A very instructive exhibit on the Renold stand is a running chain, arranged for observation by means of the rotoscope. This permits the engagement of the chain and sprocket to be observed at high speed, as if it were stationary, and is a practical demonstration of the accuracy of workmanship in both chain and sprocket. A new type of chain rivet extracting tool is also shown, and it eliminates all the disadvantages of previous types. It is, moreover, practically unbreakable, and may be used on both old and new pattern roller chains.

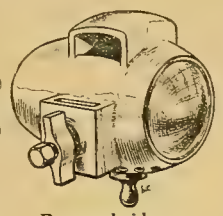
LUCAS ELECTRICAL CO., LTD., Birmingham (217).—This stand is devoted to a very complete display of the Lucas Magdyno outfit, as well as examples of the Thomson-Bennett magnetos, and the Lucas six volt dynamo. As is generally known, the Magdyno is a mechanical combination of these two units, hence the absolute independence of the lighting and ignition circuits in its construction. Motor cyclists will note that the magnetos which have hitherto been known as Thomson-Bennett will, in future, bear the Lucas name, since the former company is controlled by Messrs. Joseph Lucas, Ltd. Those who are not familiar with the internal construction of the Magdyno apparatus will be able to satisfy their curiosity by examining the carefully sectioned models which are shown. These are fitted with a small hand wheel in place of the driving sprocket, so that the armatures of the magneto and dynamo, with their interconnecting train of gearing, may be rotated. No great alteration has been found necessary in the general construction of the outfits, but there are detail improvements in the lamps and fittings. An electric horn also has been introduced to work in connection with the set, and a special terminal is provided in the switch box.

J. A. RYLEY,—Birmingham (220).—Single-cylinder two-stroke enthusiasts who sigh for dynamo lighting on their machines should not fail to visit this stand, where may be seen the B.T.H. magneto lighting set which was recently described in *The Motor Cycle*. This device makes use of the extra maximum

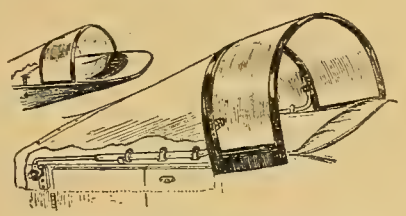
Great shock-absorbing capabilities are claimed for the Brampton spring link chain.



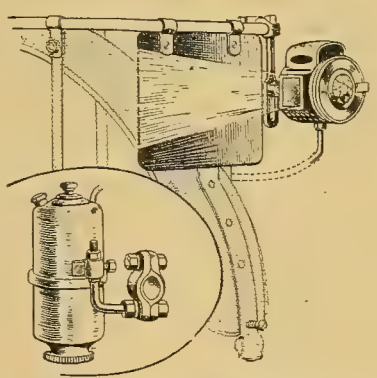
Roberts and Hibbs adjustable belt fastener used on the New Scale machines.



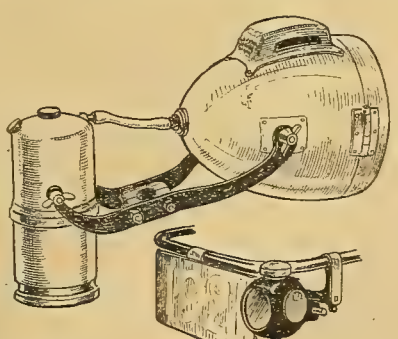
Rear and sidecar Holdtite lamp.



Two types of Easting windscreens—the Royal, which is carried on telescopic arms hinged in front of the sidecar door; and a lightweight model.



Attachment of the Miller rear light does not necessitate drilling the number plate



Almost the neatness of an electric lamp is attained in the acetylene set made by the Mechanical Products Co.

position of the armature which, of course, is not used for ignition on single-cylinder two-stroke engines. The excess primary current is distributed by a centrifugally-operated brush to an insulated segment on an extension of the contact breaker. This segment is connected to a battery carried on the handle-bar head lamp bracket from which the current for head and tail lamps is drawn. The battery is of special construction to avoid splashing of the acid. A complete set is shown working. In addition to this there is a complete battery lighting set for sidecar outfits which will be known as the J.A.R., and a new type of the well-known French Vita sparking plug is there. This is of very small overall dimensions, but it nevertheless has a detachable insulator, and is specially recommended for two-stroke engines. A series of spring clips for attaching acetylene lamp tubing to motor cycle frame and carrier tubes is also a speciality of the exhibitors.

HERBERT TERRY AND SONS, LTD., Redditch (213).—Although the private motor cyclist may be inclined to pass the display of Terry springs, if he pauses a moment to look amidst the resplendent display, he will recognise many familiar components. In fact almost every special type of spring suitable for no matter what machine is on exhibition; indeed, looking into the glittering cases it is impossible to imagine any wizardry in the manipulation of spring steel which this specialist firm would fail to accomplish.

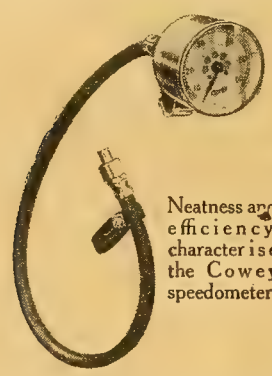
LODGE PLUGS LTD., Rugby (219).—The high standard of finish and reliability associated with the Lodge name is, of course, maintained, and one or two innovations have been introduced. Perhaps the most interesting is the new two-stroke plug, which is of the single point variety having a detachable central electrode and insulator. Another model, which has proved to be highly satisfactory under most strenuous conditions, is the model K racing plug which was used by the winners of both senior and junior T.T. races in the Isle of Man this year. The well known Lodge sign which consists of 150 plugs sparking merrily cannot fail to be noticed.

POWELL AND HANMER, LTD., Birmingham (215).—The high standard of lighting equipment in which this firm has specialised is well maintained by every item in its show cases, while to those interested in electric installations the P. and H. dynamo set will have special attractions. It is shown not only in its component parts but also mounted upon two machines, one a well-known single-cylinder and the other an equally famous flat twin. The pulley of the dynamo contains a spring clutch device which disconnects the drive when the speed tends to become excessive; the transmission is by means of a leather link belt. Amongst the electric head lamps is one of a new type having a very deeply cowled front. This is a feature which hitherto appears to have been neglected on electric lamps which, especially in foggy weather, tend to throw an excessive glare upwards; a cowl, of course, should prevent this. Incidentally, it is curious to note that one example of this lamp is carefully fitted up on the same bracket as an acetylene generator—possibly an oversight in the rush of show preparation.

This Dekla horn presents an admirably clean exterior.

PATCHQUICKS, LTD., Tiverton (209).—In equipment for tyre repair the name Patchquick has become a household word. To endeavour to add any comments or eulogy to the excellence of these well-known products would be fruitless.

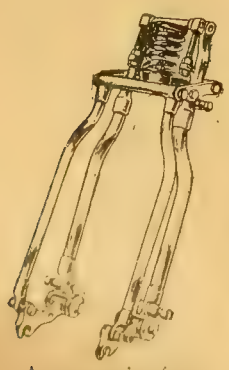
DUNHILLS, LTD., London (214).—A general display of accessories and motor clothing justifies the slogan of this house which indicates that everything for the motorist is obtainable but the machine. A splendid collection of lighting equipment, both electric and acetylene, is to be seen, and some specially neat lamps of the former variety are sold



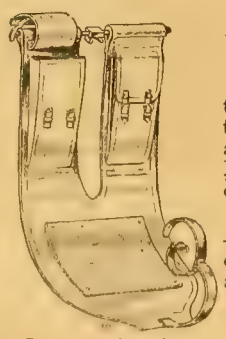
Neatness and efficiency characterise the Cowey speedometer.

as complete sets for sidecar outfits. Noticeable also are the small separate deflectors for motor cycle acetylene rear lamps.

APOLLO PLUG MFG. CO., London (199).—A new type of plug is being made by this firm, which has already earned an enviable reputation with its manufacturers. This new plug is of the detachable variety, and has a mica insulation. A heavy central electrode with a nickel firing point is used, and this is designed to dissipate as rapidly as possible the heat to which it is subjected. In addition to this, standard types of plugs are shown, while to be mentioned as a suitable Christmas present for a motor cyclist is a plush case of four plugs. A range of Apollo electric horns are also to be seen; they are remarkable for purity and penetration of tone and low current consumption.



A rear spring-frame attachment for existing machines — the Warner — exhibited by the East London Rubber Co.

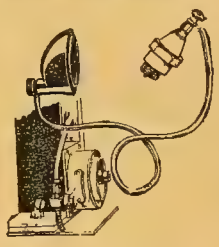


Conveniently placed pockets are an additional advantage on the College mud shield.

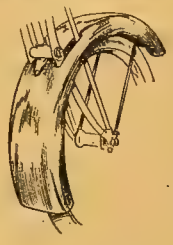
Special requirements demand special fitments, hence the sturdy construction of this Brooks trunk for the sidecar luggage grid.

MOHAWK CYCLE CO., LTD., London (172).—Innumerable accessories, but one which will appeal especially to motor cyclists is the Cearns spare tube carrier. This is a simple case of spun aluminium which is clipped to any convenient frame tube of the machine; a single central bolt with wing nut around which the tube is wound holds the two parts together.

C. BINKS, LTD., Eccles, Manchester (169).—Amongst the exhibits special attention must be drawn to the new Binks sparking plugs. This has been produced with the intention of providing a plug comparable with the best at about half the price usually charged. The plug is of very small dimensions with a non-detachable insulator. The single point is of pure nickel, and the design is one which is likely to obviate any trouble from shorting due to over lubrication. The well-known three-jet carburetter remains unaltered in principle, but slight constructional improvements have been introduced, and very careful efforts have been made to render it suitable for fitting to all types of machines; a large variety of special induction pipes and hot air intakes are also shown for use on every type of machine. An entirely new arrangement, which will appeal to Morgan owners especially, is an interconnected foot and hand control.



By removing the high-tension terminal and contact-breaker cover of the Fellows magneto the depredations of the thief are hindered.



Large domed guards are a speciality of the Coventry Plating and Presswork Company.

MIDDLEMORES (COVENTRY), LTD. (166).—A display of leather goods for motor cycle use. Standard types of toolbags and saddles are prominent.

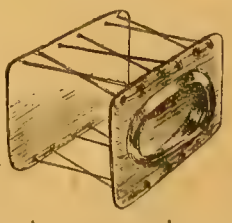
STONEHOUSE WORKS CO., West Bromwich (177).—Motor cyclists who require footboards or footrests for the conversion of old type machines may see many suitable patterns made by this firm. They can be obtained through all agents.

An example of Hoffmann "Big End" roller bearings (left) dissected, and (right) in its complete form.

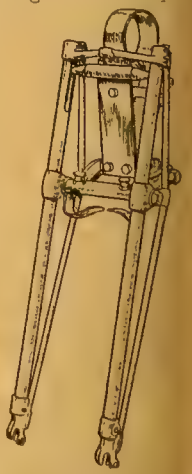
SPHINX MANUFACTURING CO., LTD., Birmingham (179).—The name Sphinx and high-class sparking plugs are synonymous. A large variety of patterns are made, including the bar type with both mica or ceramic insulators. These plugs have been proved to be satisfactory on practically all types of engine, but a special two-stroke model is also shown. This has a detachable steatite insulator.

Few parts are used in the Lamplugh mechanical pump; the throw of the plunger is varied by an eccentric working on the reduced part and controlled with the throttle.

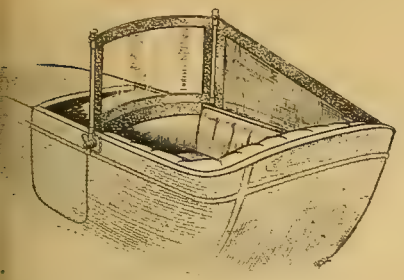
AMAC, LTD., Birmingham (179).—In view of the many suggestions which arise from time to time that controls should be standardised, it is interesting to note that the new Amac carburetter levers are completely interchangeable, may be used on either side of the handle-bars, and arranged to open either inwards or outwards. The complete control itself may also be altered relative to the handle-bar, in order that it may be brought to the most convenient position. Of the carburetters themselves, there is little to say, since they are well known and justly popular with a great number of motor cyclists. Single-lever and two-lever models are shown, also a number of variations, vertical and horizontal, etc., to suit different types of engines. There is also a miniature carburetter.



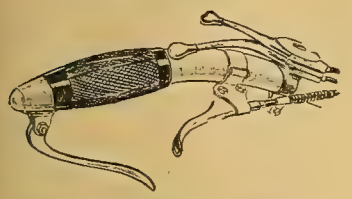
A new concave knee-grip introduced by Alfred Roberts & Co. Ltd. The rim is of soft rubber.



The Flexifork, a new component shown on the East London Rubber Co.'s stand.

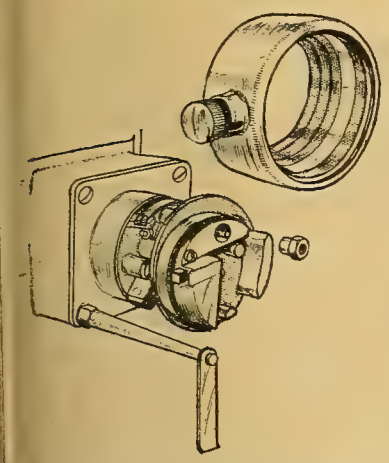


The Cameo windscreen is fitted with a side curtain.

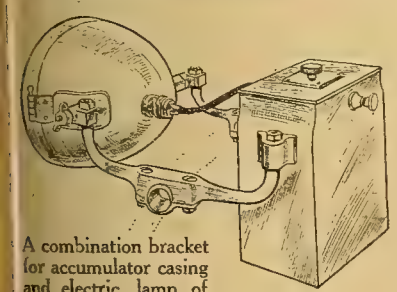


A special short lever for the operation of compression release valves, made by Bowden Wire, Ltd.

Clayrite horns have the turns concealed inside the bell.



The centrifugally-operated distributer brush for the lighting circuit on the ingenious B.T.H. lighting and ignition set.



A combination bracket for accumulator casing and electric lamp of Hunt manufacture.

CHAS. H. PUGH, LTD., Birmingham (181).—The chief feature of interest is, of course, the Senspray carburetter, which, however, has not been modified for 1921. The float chamber and body consist of aluminium die castings of very clean appearances, and the damping device on the vaporiser which allows the carburetters to be made sensitive or automatic at will has been retained.

BRITISH HUB CO., LTD., Birmingham (186).—Any motor cyclist who contemplates building up a cycle car from components will find all he requires in the way of hubs. The sidecar hubs especially are characterised by the large diameter of the spindles and bearing cups. There are two types of axle, one intended to be brazed in and the other having a cone and nut fixing.

SURRIDGE'S PATENTS, LTD., London, S.E. (187).—The principle underlying the Holdtite patch is clearly shown by diagrams and actual examples. This repair patch, when properly applied to a punctured or torn inner tube, is claimed to hold the damaged part in such a way as to prevent any further spreading of the trouble. Another special feature shown is a range of cast aluminium sidecar and tail lamps of pleasing appearance and moderate price. In addition to these are shown the Surridge gas-bag connections for acetylene lamps.

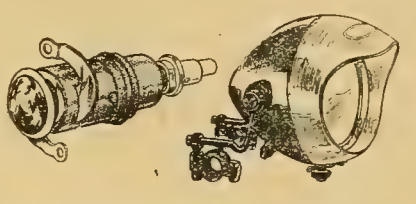
STURMEY-ARCHER GEARS, LTD., Nottingham (190).—The general familiarity of motor cyclists with this well-known component gear box in both its light and heavy forms renders comment almost unnecessary. The enquiring rider, however, who has never dismantled his gear box, will be interested to study the cases of internal parts which are displayed. The high class of workmanship and simple construction of both the two and three-speed boxes are at once apparent.

BLUEMEL BROS., LTD., Coventry (188).—The chief item of interest is the celluloid windscreen for sidecars. This screen is not of the adjustable type, but remains as a semi-permanent fixture on the upper part of the sidecar. In conjunction with a dash over the door it provides very complete protection for the passenger, both front and side draughts being guarded against. Other items shown are inflators and similar accessories, in which celluloid plays an important part.

ERNEST H. HILL, LTD., Sheffield (210).—A very full range of bulb horns and foot inflators.

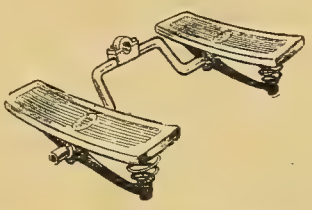
TIMSON BROS., Birmingham (206).—Several items which will appeal to motor cyclists. The most prominent are two tyre inflators; these break away from conventional lines in an accessory which one would have imagined to be almost incapable of further improvement. The first is the Burn Easy Fix, which has an integral push-on connection secured at the end of the barrel. The plunger is of the solid steel rod in place of the more usual tube, and, owing to the non-leaking quality of the connection, a very high pressure can be attained in a few strokes. In fact, it is claimed that the efficiency of the hand pump is as great as that of the average foot pump. The other inflator is known as the D.A. Its connection is of the ordinary type, but, owing to an ingenious one-way valve, it

An inflator connection, always ready for use, is carried in the D.A. pump—it is ejected by the air pressure of the pump itself. Exhibited by Timson Bros.

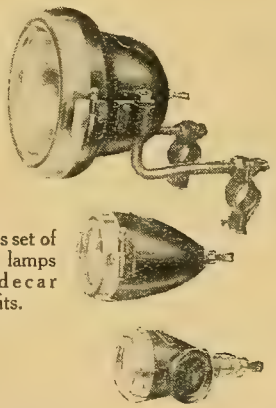


A neat and substantial Lucas electric tail lamp.

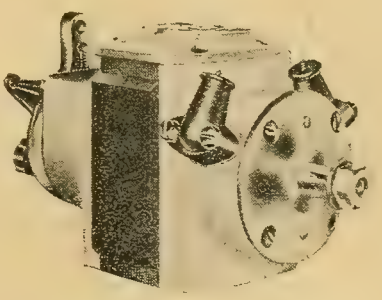
A neat Powell and Hanmer electric head lamp with a deflecting cowl.



Stonehouse aluminium spring footboards.



Dunhill s set of electric lamps for sidecar outfits.



Compactness is the keynote of design in the new M-L magneto for large V and flat twin engines.

Accessories at the Show.—

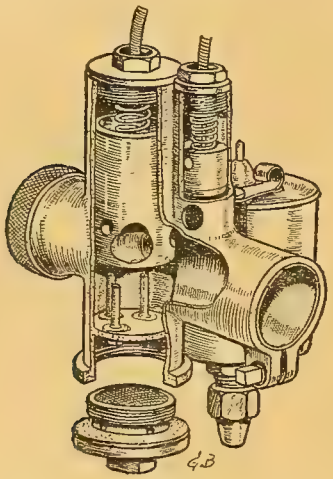
is permanently carried in the "business end" of the pump, and is ejected for use by a stroke of the handle. It does not leak in whatever position it is used. Fitments to be noted here are the M.A.P. detachable mica sparking plug, which is guaranteed for an indefinite period, and the Shaler five minutes vulcaniser, which makes use of combined patch and heat units in an extremely simple manner.

BROWN BROS., LTD., London (191).—The exhibit of these well-known factors is a show in itself, as almost all kinds of accessories and tools are to be seen, in addition to a number of component parts, such as gear boxes, footrests, footboards, and saddles. Fittings of every description, and almost every type of lighting set are exhibited. Accessories such as aluminium wheel discs, leg guards, and windscreens are also prominent, while there is a complete range of motorists' clothing. Those who are interested in motor repair work will find much that will appeal to them in the tool section of this stand; an item of special interest to the enthusiastic mechanic being one of the latest 3½in. Drummond lathes, which is replete with all manner of accessories and conveniences, such as integral electric motor drive, an overhead milling attachment and dividing arrangement.

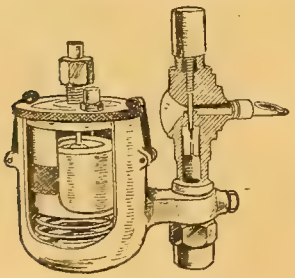
THE COVENTRY CHAIN CO., LTD., Coventry (192).—Various applications of inverted tooth and roller chains, together with a large number of photographs showing machines equipped with the products of this company. Of interest, also, are a number of milling cutters, which are used for the production of standardised chain sprockets.

TAN-SAD WORKS, Birmingham (194).—Probably one of the most talked of fittings in the Show is the new Tan-Sad No Hurts motor cycle saddle. This is attached to the carrier of a motor cycle by the left and right-hand thread locking attachment which has been familiarised on the Tan-Sad pillion. The seat portion of the saddle is carried on the forward extremity of two laminated leaf springs, the action of which is controlled by a long swinging link. Movement of the saddle, therefore, is in an almost vertical plane, and provides a remarkable degree of comfort, so much so that the necessity for a spring frame (as far as the rider is concerned) is eliminated. Various arrangements of the saddle are shown, the chief differences being in the method of carrying the tool bags and the addition of a pillion seat. Particulars of the Tan-Sad pillion riding insurance policy may be obtained, and another exhibit, although not of immediate motor cycle interest, is the Tan-Sad all-metal seat for workers. This is suitable for office or works, and is indestructible and extremely comfortable. It has an adjustable back rest.

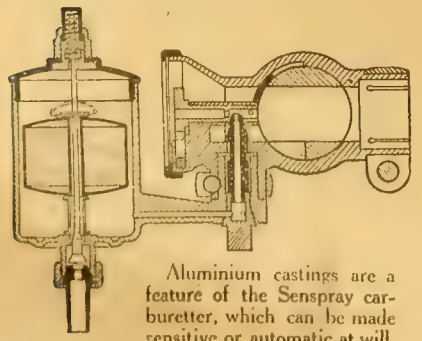
SOME TYPES OF CARBURETTERS AT THE SHOW.



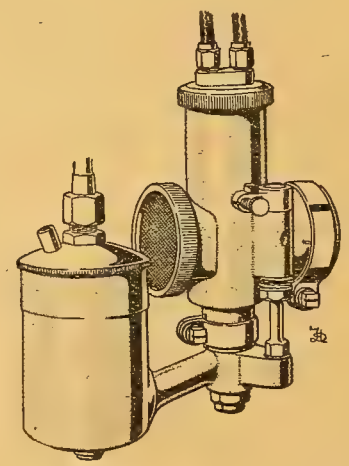
Part sectional view of the popular Binks three-jet carburetter.



A section of the new Cox-Atmos float chamber with integral filter.



Aluminium castings are a feature of the Senspray carburetter, which can be made sensitive or automatic at will



External view of the well-known Brown and Barlow pilot jet carburetter.

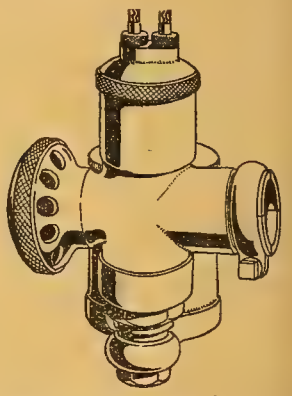
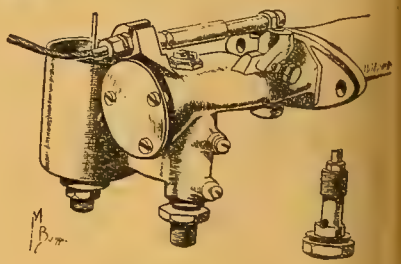
MAIN PETROL ORIFICE
BIPASS REGULATING SCREW
PIPE to BIPASS IN INLET PIPE
PIPE to ANNULAR GROOVE in CHOKE TUBE

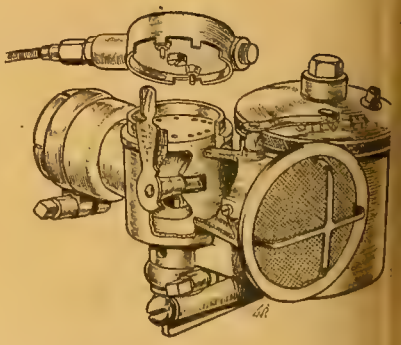
A carburetter of simple construction—the special claim of the Degory is its extreme economy.



Standard type two-lever Amac carburetter adopted on many makes of motor cycles at the Show.

A new French carburetter—the single-lever Vici.





One lever control is used on the Claudel-Hobson carburetter, in conjunction with an air compensating device for starting.

QUESTIONS AND REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C.4, and whether intended for publication or not must be accompanied by a 2d. stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Electric Lighting for Lightweights.

Will you let me know if you recommend electric lighting for a lightweight motor cycle? At present I am using acetylene lamps, which are very unsatisfactory. Would you suggest that the vibration upsets the bulbs of electric lamps?—J.C.H.

An accumulator or dry battery lighting set should answer all reasonable requirements, provided you do not undertake long journeys which involve continuous use of the lamps for five or six hours, or more. Good quality metal filament bulbs will not suffer unduly from the effects of vibration.

Converting a Magneto for Lighting.

Is it possible to convert an old magneto into a low voltage dynamo? If so, will you please tell me how it could be done?—A.R.

The best way of using an old magneto for lighting purposes is to remove the contact breaker and the winding. Then wind as much 22 g. insulated wire on to the armature as you can get on, and replace the contact breaker with a simple two-part commutator. By using two collector brushes on this, you will be able to use the dynamo for accumulator charging as well as direct lighting. It would be advisable to buy some simple handbook on dynamo construction before undertaking any work of this kind.

Freshening Accumulators.

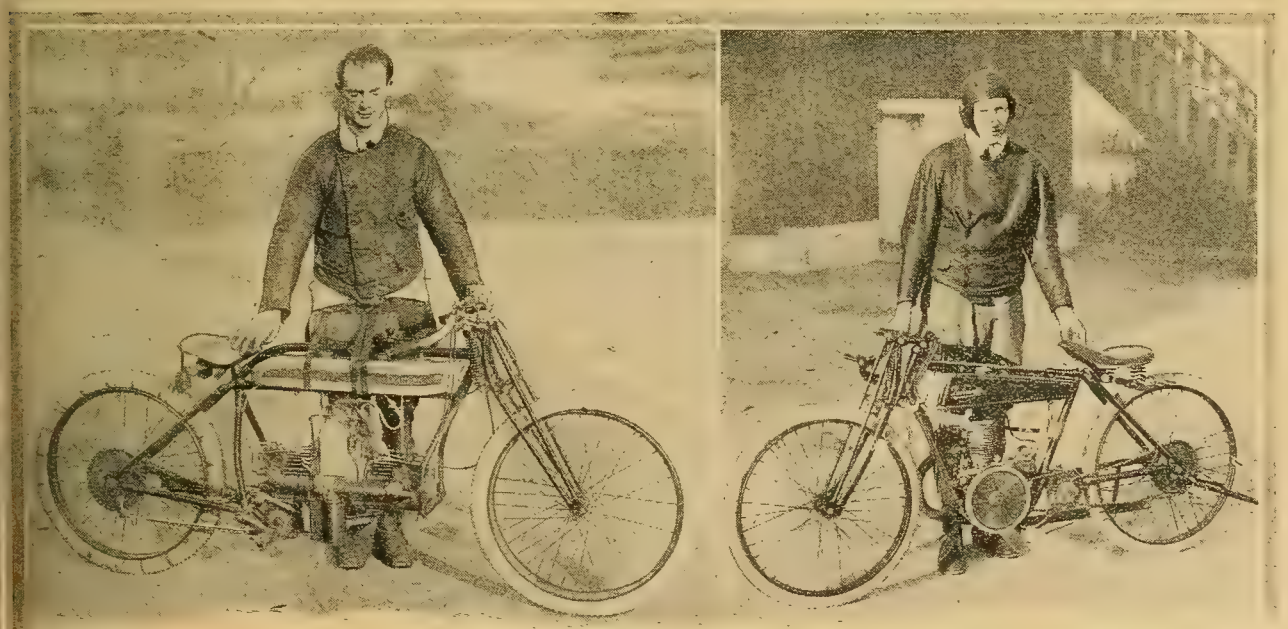
(1.) I wish to give my accumulator a freshening charge periodically during the winter. The electrical supply here (Morpeth) is 240 volts (d.c.), and the charging rate must not exceed 1 ampère; a little less will not matter. What arrangement of lamps or resistance would you advise? (2.) My battery has apparently been filled with the usual English solution, 1.22 s.g.; the stronger American solution, 1.3, is what is recommended. What difference does the stronger solution make?—F.L.J.

(1.) You should use two 32 c.p. carbon bulbs in parallel as a resistance when charging the accumulator from a 240 volt supply (direct current). (2.) The slight difference in the specific gravity of the two solutions is negligible.

Converting Hub Geared Machine.

I have a 1914 4 h.p. Triumph with hub gear, which is not in good order, and have been thinking seriously of having a countershaft gear box fitted. I know that I shall require a new rear wheel, but will the top and bottom countershaft stays fit the other part of the 1914 frame? What about the belt and chain line when I order the new parts, also will the engine sprocket fit where the belt pulley is now? The rest of the machine is in fine order, and I think it would be worth while having a countershaft gear fitted.—R.J.N.

You would be able to fit the new pattern top and bottom stays to the 1914 frame, and we do not think there would be any difficulty in fitting the sprocket to the engine shaft; but you would probably find it better to sell the present machine, and get a countershaft model, as you will find many little details will require slight alteration—such as alteration in the brakework and making provision for the primary chain cover, and the expense will probably be as great as the increased outlay which will be incurred.



Show-time is usually a period of activity at Brooklands, and many are the records attempted at this period. On the left is seen B. Tudor Thompson with a stripped overhead valve Douglas, while on the right is D. R. O'Donovan with a Velocette in racing trim.

When to Decarbonise.

My 7-9 h.p. Harley-Davidson was new this year, and I have run about 2,800 miles, and want to run a similar distance next season without any loss in efficiency. Should I take the engine down and decarbonise? I have not noticed any falling off in the running of the engine. I understand that large capacity engines with low compression do not require very frequent attention in this respect.—F.L.J.

If the engine does not show any signs of falling off in power, there is no need for you to dismantle it.

Sidecars for Travellers' Use.

We have endeavoured as far as possible to go into the question of supplying our representatives with up-to-date sidecar outfits. Would you be good enough to give your views as to whether there is a great saving in time and cost over railway travelling?—M.S. AND CO.

You do not state the nature of the journeys which your representatives have to undertake. If, for instance, they do long distances to places which are served by main line trains, the motor cycle will show to disadvantage in the matter of time. Generally speaking, however, the motor cycle is much better than the railway, since there is no time wasted in getting to and from the railway stations or in finding transport between calls. A good working estimate of cost is about 3d. per mile for a sidecar outfit; this, of course, covers all charges, such as garage, insurance, depreciation, etc. Needless to say, a considerable amount of luggage can be carried.

Extraordinary Plug Trouble.

I ride a 1919 3½ h.p. Rudge-Multi with Swan sidecar, and have covered nearly 10,000 miles. I admit that I ride consistently fast, averaging regularly very fairly high speeds on long runs, but do not drive unreasonably. My engine gets fairly hot—far beyond the "hand on crank case" stage, though for the most part I over-oil. Last season I broke four exhaust valves, but found this due to weak spring and a sloppy guide. I am now experiencing a lot of plug trouble; the points of a new plug burn to a useless stage after about 800 miles, whereas I rode my first 5,000 miles on one plug. My engine has just been most thoroughly overhauled, new valves, guides, springs, and piston rings, and I have since ridden about 400 miles. I found great difficulty in starting to-day, and on removal of the plug (a standard three-point pattern) I found the centre point non-existent, and the distance between other points absurd. Perhaps you can enlighten me as to why I have burnt out five plugs in about 4,000 miles?—E.M.

The sparking plug trouble which you have experienced is most unusual, and we do not recollect having met with any similar case. It seems most unlikely that you would have obtained several defective plugs one after the other, but at the same time this appears to be the only explanation.

Carbon in Piston Ring Grooves.

I have a 1913 6 h.p. Clyno sidecar outfit, and since being decarbonised the front cylinder refuses to fire evenly at any speed, and ceases altogether when the throttle is opened beyond half-way. Everything has been carefully tested. Valve and ignition timing checked on both cylinders, no air leaks, new plugs fitted, new valve springs, and the petrol system appears perfect. The carburetter is variable B. and B. The carbon deposit was very thick behind the rings on both pistons and was removed, but while the front cylinder will not fire, the back runs well. It has been suggested that the piston rings are at fault. When the engine was taken down it was running perfectly, and the timing and carburetter setting are precisely the same as then. The utmost care was taken in every way.—R.G.H.

If you are quite sure that there are no air leaks either at the joints of the induction pipe or at the inlet valve stems, it would appear that the faulty running is due to the removal of the carbon from the piston ring grooves. This trouble is often experienced in the case of fairly old machines, and we think the best thing to do would be to have the piston ring grooves trued up, and to have special oversize rings made to fit them.

IMPORTANT DATES.

Nov. 29th.-Dec. 4th—
Olympia Motor Cycle Show.

Dec. 10th - 19th—
Brussels Show.

Dec 27th 28th—
M.C.C. London-Exeter Run.

Jan. 28th to Feb. 5th, 1921—
Scottish Motor Exhibition, Kelvin Hall, Glasgow.

RECOMMENDED ROUTE.

BIRMINGHAM TO SCARBOROUGH.—H.S.H.

Birmingham, Sutton Coldfield, Tamworth, Ashby-de-la-Zouch, Breedon, Castle Donington, Long Eaton, Nottingham, Daybrook, Mansfield, Worksop, Blyth, Bawtry, Ansterfield, Finningley, Thorne, Goole, Howden, Holme, Market Weighton, Middleton, North Dalton, Driffield, Langtoft, Scarborough.

HERNE HILL TO EDINBURGH.—R.L.J.

Herne Hill, Denmark Hill, Kennington Road, Westminster Bridge, Bird Cage Walk, Hyde Park Corner, Park Lane, Edgware Road, Baker Street, Park Road, Kentish Town, Highgate Road, Hatfield, Welwyn, Stevenage, Baldock, Biggleswade, Tempsford, Eaton Socon, Buckden, Alconbury, Stilton, Wansford, Stamford, Grantham, Newark, Tuxford, Retford, Bawtry, Doncaster, Wentbridge, Ferrybridge, Micklefield, Aberford, Wetherby, Boroughbridge, Leeming Bar, Catterick, Scotch Corner, Piercebridge, Bishop Auckland, Durham, Chester-le-Street, Newcastle, Ponteland, Kirkwhelpington, Otterburn, Byrness, Carter Bar, Jedburgh, Melrose, Stow, Gorebridge, Edinburgh.

SPARKLETS

A Meritorious Performance.

The special prize for the most meritorious performance in the Ballard's Cup trial, which took place on October 30th, was awarded to H. Guy, who rode a 2¾ h.p. Coulson B.

An Effort towards Stability.

Complaints of late have been frequent regarding the difficulty of giving firm quotations, owing to the rapid and unforeseen increases in the cost of raw materials, but as an endeavour to cut out this difficulty as far as it concerns users of weldless steel tubing and tubular parts, Messrs. Accles and Pollock, Ltd., of Oldbury, Birmingham, propose that no orders booked by them shall be subject to fluctuation in price in respect of all deliveries up to July 31st, 1921.

An Amalgamation in the Acetylene World.

The two chief firms in the dissolved acetylene industry have now amalgamated, and in future Messrs. Allen-Liversidge, Ltd., and the Dissolved Acetylene Co., Ltd., will continue their business under the general title of Allan-Liversidge, Ltd. Also included in this amalgamation is the company of Imperial Light, Ltd.

Calibrating Jet Sizes.

Some very interesting remarks concerning jet sizes appear in a new booklet describing the Senspray carburetter. The makers, Messrs. Charles H. Pugh, Ltd., Whitworth Works, Tilton Road, Birmingham, announce that in future all Senspray jets will be calibrated in an up-to-date manner. The figures will represent the number of cubic centimetres of petrol passing per minute under a pressure due to a convenient standardised head of petrol. As an example, the old No. 24 jet will now be marked 45 c.c. The equivalent from Nos. 24 to 26 are given in cubic centimetres opposite page 18 of the booklet.

Running a Cycle Car.

The following are extracts from the log of a Blériot-Whippet cycle car owner, and are interesting as showing the economy of this type of vehicle: Total mileage, 7,000 miles. Average miles per day, 56 miles. Petrol consumption, 52 m.p.g. Petrol consumption after special tuning, 66 m.p.g. Oil consumption, average 550 m.p.g. Oil consumption in hilly and hard country, 430 m.p.g. Total weight, 19 cwt. Maximum speed all on for one mile, 50.4 m.p.h. Maximum speed with favourable wind, no passenger, half mile, 56 m.p.h. Average m.p.h. with luggage, under favourable conditions, 25.9. No mechanical stop for 7,000 miles. Original tyres are still on the car, and unpunctured—an excellent record for tyres and car.

The Biggest Dealers in the South.

Not only are we the biggest dealers in the South, but also probably the oldest. We entered the motor cycle business in 1898. Our long experience and reputation has enabled us to procure a selection of agencies that probably no other firm can offer you. Here are some of them—

A.J.S.	LEVIS
NORTON	TRIUMPH
ZENITH	MORGAN
MATCHLESS	ENFIELD
NEW IMPERIAL	HUMBER
MARTINSYDE	FRANCIS-BARNETT

We can give delivery of 1921 models of most of the above, and shall be pleased to send full particulars on receipt of a postcard from you.

Our Reputation

You have been to the Show and found great difficulty in selecting your 1921 mount. The next great difficulty is to find a reliable agent. We pride ourselves on being able to fill that gap, probably better than any other firm in England. We have a whole host of testimonials from satisfied customers and nobody has ever regretted a deal with

"Julians"

Motor Cyclists who have dealt with us are more than pleased with the treatment received, not only when buying the machine, but also afterwards. Our aim is to please our customers, and this we always do at all costs.

After visiting the Olympia Buy it at

F.R.S.

A NEW Generator

—with all the irritating faults eliminated!

Yes—there *have* been faults—we admit OURS—but we have profited by EXPERIENCE, and THIS Generator embodies improvements which make it absolutely foolproof.

It gives a uniform supply of gas, ensuring a clear, steady light—and will generate sufficient gas for Head, Tail, and Sidecar Lamps.

Ask your agent to show you one. All the Headlight sets now being sent out have this **new generator.**

PREMIER Cylinder, 1913, 3½h.p., perfect, £3/5; ditto 1911, £3/5; James 2½h.p. cylinder, 25/-; Precision 3¾h.p. cylinder, £3; Premier 2-speed gear box, £5/10; Premier frame and tank, complete with spring forks, £4; Premier cam wheels, 6/- each; Premier connecting rod, £1; pair of Premier flywheels, 30/- pair.—Below.

BOSCH Watertight Magneto, £4/15, anti-clock; ditto open type, 57/6; Philipson pulley, suit Triumph, £3; Grado, suit J.A.P., £3; Chater-Lea 2-speed box, £4.—Below.

SINGER 4h.p. Connecting Rod (pattern), 34/-; ditto 2½h.p., 22/6; Singer pattern 2½h.p. piston, 22/6, complete; ditto 4h.p., 28/6 complete; ready in about 7 days time; adjustable pulleys for countershaft, 25/- each. I have a large stock of Singer small spares.—Below.

TRIUMPH 1914 Cylinder, new, fin chipped, £3/10; ditto countershaft, £3/10.—Syd. Pearson, Gate House, Cheylesmore, Coventry. [X2472

GOVERNMENT Surplus.—New army serge breeches, 30/-; nearly new, 15/-; motor cyclists' fawn waterproof Gaberdine overall suits with hood, 25/-; new brown and black field boots, 50/-; ladies' high-legged field boots, black 30/-, brown 38/-; new Australian boots, 30/-; postage extra. Send for list of other goods.—M.C., Letheridge and Son, 75, George St., Devonport. [8659

ENFIELD Parts, quite new and faultless, for 6h.p. 2-speed gear, 1916, onward, 36 tooth chain wheel with brake drum, their reference No. 102, 19/-, spindle only, reference No. R106, 18/-; expanding band only, reference No. R110, 9/-; high gear centre drum, reference No. 115, 15/-; spring roller, reference No. 124, 2/9.—Dene Motor Cycle Co., Haymarket, Newcastle-on-Tyne. [X598

8h.p. Royal Ruby Spares.—Chain covers, front and back, 15/- each; centre portions of frame, £5; forks, complete, £4; rims, 3/6; tanks, complete with fittings, £3; T.T. handlebars, 12/6; rear carriers, 15/-; footboards, complete, £1/15; 8h.p. J.A.P. cam wheels, 15/-. The above is only a selection of our stock. We hold a huge stock of most parts for Royal Ruby's.—Below.

B.S.A. Spares.—Centre portions of frames, £3/15; chain stays, £1/12; back stays, 18/-; petrol pipes, 2/6; rims, 3/6; silencers, complete with magneto platform, 16/6; handle-bars, 12/6; fork blades, £1/10; magneto chain covers, complete, 8/-; magneto sprockets, 2/6. The above is only a fraction of our stock. Let us have your enquiries.—Below.

TOOLBOXES, 32×18×12, fitted tray and compartments, £1/10. All goods sent on approval against cash plus carriage. Stamp please.—Holliday Bros., 20, Queen St., Hammersmith Broadway. [2078

DISCS.—We are makers of discs for any type of motor cycle, polished aluminium 25/- and 30/- per wheel, enamelled steel 20/- per wheel, Rudge Multi discs 5/- per wheel extra; discs for Douglas, Triumph, Indian, Harley-Davidson, and Rudge Multi motor cycles always in stock; prompt deliveries.—Hill and Co., Discs Specialists, 1 and 3, Walmersley Rd., Bury, Lancs. [0351

EVERY Part in Stock for 1915 5h.p. Indian motor cycle, all sizes of motor cycle chains in stock, any pattern of piston made within 12 hours, huge stock of J.A.P. (all sizes), Triumph, Humber, Indian, etc., engines overhauled at short notice, parts duplicated, special prices for tanks, mudguards, etc.; cheapest house in the trade.—Walter Matthews, 114, Suffolk St., Birmingham. [4951

NEW 1920 8h.p. J.A.P. Engine, £34; Sthenos cycle-car carburetter, new, £2/10; 100 amp. 6 volt Exide accumulator, £4/10; 40 amp. 6 volt charged ditto, £1/5; pair of H.B. electric side lights, new, £3; Amac, 27/-; single Bosch, watertight, £5; useful exchange or offer considered; wanted, 50° twin Bosch magneto; Berko dynamo, 50/-.—A. Knight, Police Station, Woodford Bridge, Essex. [1872

ROBBIALAC STAND No. 14
OLYMPIA CYCLE AND MOTOR CYCLE SHOW

ACTUAL specimens of work carried out with Robbialac Enamel and Robbialac Transparent Finish, and showing the beautiful results obtainable, will be on view at the Robbialac Stand. Practical demonstrators will be in attendance, and will be pleased to give advice on cycle enamelling. You should in any case ask for the free leaflet "INSTRUCTIONS FOR AMATEURS TO ENAMEL A CYCLE" and colour card. If you cannot visit the exhibition, write for the leaflet direct to the Sole Manufacturers of Robbialac:—Jenson and Nicholson, Ltd. (Publicity Dept.), Robbialac Works, Stratford, London, E.15.

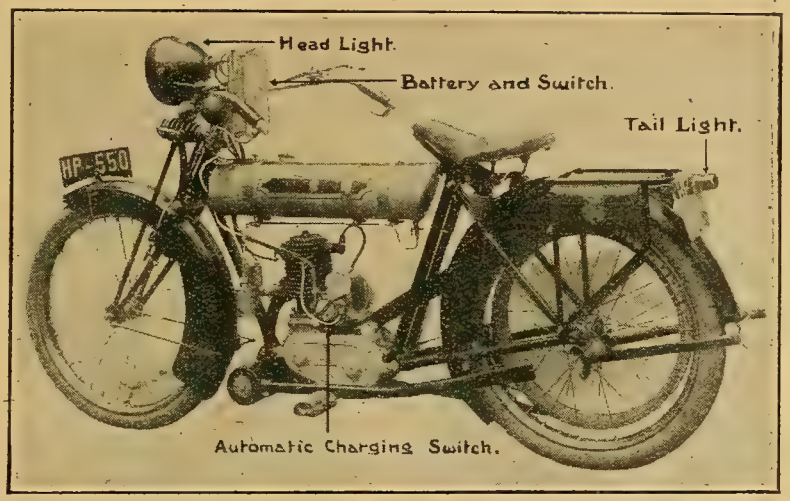
B.T.H. "Sparklight"

combined ignition and lighting system.

The B.T.H. "Sparklight" combined ignition and lighting system for single cylinder two-stroke engines, consists of a standard B.T.H. single cylinder magneto, with an attachment to enable the idle half of the voltage wave, generated in the low tension winding (which with every single cylinder magneto is wasted), to be utilised for either charging a battery or supplying lights.



Advantages:

Lighting system does not increase the power required to drive the magneto.
Light always available whether engine is running or not.
Light can be obtained with or without battery when engine is running.
Absolutely no attention required. Charging switch is automatic in operation.
Battery cannot discharge through the magneto when engine is not running.
Lighting does not in the slightest degree affect the efficiency of the spark.
Non-spillable battery. Inexpensive.

Licences in 1921.

ELSEWHERE in this issue we are able to give further particulars of the new licensing regulations, which come into force with the New Year. The Roads Bill to authorise the revised system was only introduced in the House of Commons on November 26th, and, as everything has to be in full working order by January 1st, county and county borough councils may find the time all too short.

Further, since the regulations concerning the licence card holders are available only three weeks before they have to be used, and also as owners of motor vehicles have to provide these themselves, it seems a little unreasonable to expect private enterprise to produce a quarter of a million of these holders in the short time available. Thus it will be seen that even if the local councils are ready in time, a situation may arise which will compel the authorities to grant a certain amount of grace.

The delay in bringing the matter before Parliament is not due to the Ministry of Transport, but rather to the many more urgent matters which have occupied the attention of the House since the passing of the Finance Bill, and any inconvenience caused by the delay must be borne with patience as being part of the difficult period through which we are now passing.

As regards the regulations themselves, unwelcome as they are to the majority of motor cyclists, they are not entirely without advantages. For example, in future it will be impossible for the age or history of a second-hand machine to be misrepresented, as the logbook, which will be issued to each owner, will give the history of the vehicle in a manner similar to the deeds connected with real estate. Again, the disposal of stolen machines will be rendered difficult.

No doubt the licence card, in full view on the near side of the machine, will offend many who have an artistic eye. Each year the colour will be changed—for 1921 the cards are to be blue.

Passenger Motor Cycles.

THIS week's issue of *The Motor Cycle* deals chiefly with passenger attachments and three-wheeled runabouts. The interest in these types is immense, and without doubt they are the cheapest possible form of long distance locomotion. Added to this, the motor cycle and sidecar provides a greater seating capacity than any vehicle short of a five-seated car, yet its upkeep is less than half. There has been a steady improvement in passenger machines throughout the past year, and there is a serious effort on foot to produce a sidecar outfit at a price to suit the purse of the man of very moderate means. Such efforts are to be highly commended, and it is to be hoped that they will meet with the success they deserve.

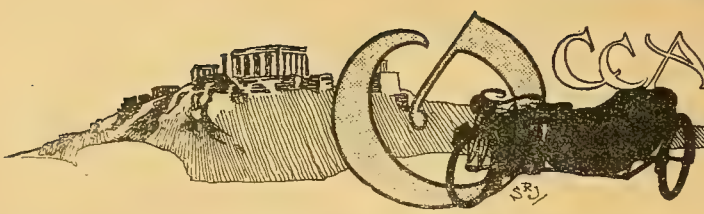
Lightweight Records.

SHOW week and the week preceding it are usually times of great activity at Brooklands, and 1920 has been no exception to the rule. Records have been broken all along the line by engines of 250 c.c., 350 c.c., and 1,000 c.c. Particular interest attaches to the performances of the miniature class, for there are still many who fail to realise that these tiny engines are a serious proposition, and are capable not only of high speeds over short distances, but also of long distance endurance records. Six hours at an average speed of 47.24 m.p.h., accomplished recently by a small four-stroke, calls for a high degree of accuracy in manufacture, as well as good design.

Once again the two-stroke has distinguished itself: this time the flying kilometre was covered at the rate of practically 67 m.p.h. by a 250 c.c. engine. Such a performance is wonderful for any type of engine of such small capacity, though we fancy it will be improved upon before long.

Earlier in the year we were able to chronicle a series of long distance records which were the first to fall to the simpler type.

An index to the advertisements in this issue will be found on the page facing the back cover



OCCASIONAL COMMENTS

BY 'IXION'

Another "Clean" Overall.

THE College Leather Co., of Northampton, has brought out yet another leg overall which does not soil the trousers during removal. A "half sole" protects the boot in conjunction with the usual integral spat, whilst the calf and thigh are covered by an ultra-wide waterproof puttee, wound spirally round the leg in two turns, and clipped at the top of the thigh. This overall should be considered in selecting one of the "clean" pattern.

An Awkward Question.

THE persistent heckler suspected that the new 'bus at the Show had never smelt the road, and was trying to nail the salesman down to a confession of the fact. At last the latter had a brain-wave. "Never been on the road, my dear sir! But this is simply absurd. She came up to the Show by road yesterday afternoon!" The salesman wiped his brow as the heckler departed. Then he caught my eye and grinned foolishly. Had I not helped him to unload the 'bus from a motor lorry?

The Best Machine in the Show.

KNUTS forward, please? Not at all. I met a rider who is something of a judge; and the average clubman might not guess his choice in fifty attempts. He was falling off the deep end about the Reynolds Runabout (did you miss it, gentle reader?) Not because it could win the Team Prize in the Six Days. But because when the motor cycle follows the push-bicycle and becomes frankly utilitarian, he thinks the machine of the day will closely follow the Reynolds lines.

Weights.

I TOOK a great interest in the weights of 1921 machines at the Show, an interest shared only by those manufacturers who had managed to get inside the 200 lb. taxation line: the remainder seldom knew or cared what their machines weighed. If my researches were complete, the 4 h.p. Coulson showed the minimum figure (196 lb.) in the 500 c.c. class, with the solo Sunbeam (236 lb.) second. I asked the Coulson works manager in which parts he had effected his saving. He instanced the front fork (20 lb.), the gear box platform (12 lb.), and the saddle unit (3 lb.).

Chivalry Up to Date.

IN the old days the gallant male got himself well and truly perforated in the jousts because another male had commented adversely on the shape of his fair lady's nose. To-day the gallant male bores into a hailstorm on Dartmoor exposed like a weather-cock on a church spire, whilst his lady love snuggles down into a capacious sidecar, fortified by an all-weather top, which prohibits alike any exchange of conversation or passing of chocolates.

LG

In the Grill Room.

A CERTAIN machine is notorious amongst owners for its unusual oil thirst—a thirst which is stoutly denied by the designer, who ascribes his customers' lamentable consumption to foolish handling. Some of the riders were trying to pull the designer's leg. Said one: "This talk of heavy oil consumption is all guff. I never got less than 1,000 m.p.g." Another went one better with 1,200 m.p.g. A third stretched the facts very taut by claiming 1,500 m.p.g. Finally a fourth clinched the controversy. "*My* engine positively *dislikes* oil. I find it prefers a thin smear of vaseline on the outside of the crank case!"

Those Trade Riders.

HOW I envy the dexterity and aplomb of certain factory testers. Myself, I am a clumsy driver, and you can guarantee that a combination of tramlines and grease will unsaddle me seven times out of ten with a thunderous wop! So I dare not have ridden two or three machines at the Show which have their carburetters protruding far outwards to act as buffers in the event of a fall towards the left. Years ago I drove an American cycle car, which shivered its inlet pipe into flinders. I was able to get home by dint of some 1in. rubber hose-pipe and copper wire; but a concertinaed carburetter would defy even my ingenuity in improvised repairs.

Overheard at the Scott Stand.

SHOW Visitor (with a grudge against the Scott demonstrator): "Hello! Same old 'bus? Looks as well and goes as badly as ever, I suppose?"

Scott Demonstrator (who had almost sold a Squirrel to a sporting rustic): "——! ——!! ——!!!"

Show Visitor (incautiously): "Why do you call your new 'bus a 'squirrel,' anyhow?"

Scott Demonstrator (triumphantly ticking off the points on his fingers): "First, she can climb trees; secondly, she's the 'bus for the (k)nuts; thirdly, she *never* sheds a nut."

(Exit Show Visitor, somewhat quelled.)

Overheard at the X—— Stand.

EMINENT technician is seen haughtily approaching a machine of novel design at the Press View. Its designer, an earnest, unknown, but promising engineer, temporarily disguised in dirt and overalls, recognises the eminent technician, and steals furtively up behind his coat tails, hoping to overhear a few laudatory comments. Eminent technician inspects the machine closely, with disguised designer breathlessly stooping at his left rear. After ten minutes eminent technician straightens himself and remarks wearily to his friend:

"Any more tripe around?"

(Earnest and promising engineer swoons in the arms of the stand charwoman.)

"Our Saloonette."

SUB-TITLE, "Two minds with but a single thought." The scene was a sidecar stand at the Show. The salesman had got a husband and wife seriously interested in his latest limousine model. It was the fifth day of the Show, and he was talking automatically like a parrot, or a guide to one of our cathedrals. Finally he reached his peroration—"I am sure if madam will kindly get inside and try the seating . . ." He bit his lip. He had caught madam's eye. Madam was eyeing the narrow door rather severely. The salesman's eye travelled from madam's eye to madam's waist. He broke off resolutely, "Now, immediately behind you, madam, is our heavy touring model . . ." Anyway, there were sidecars for all sizes at the Show.

Other Times, Other Manners.

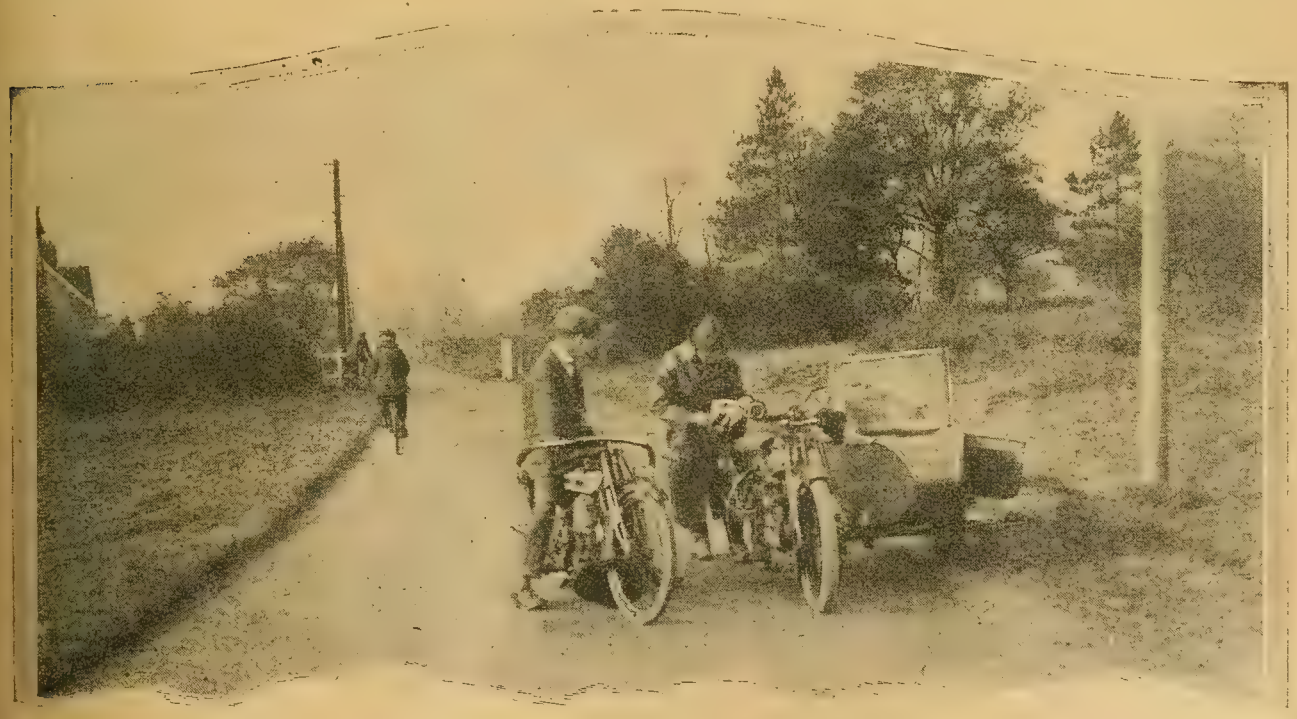
ON Show Sunday I read Lord Rothermere's weekly effervescence against squandermania with a novel respect. Somebody really ought to bring home to Mr. Austen Chamberlain the parlous state to which he is reducing the finances of the country. In the halcyon pre-war days if I met a managing director at the Show he usually shouted: "Hello, 'Ixion'; what's yours?" I never ordered bubbly in response to such invitations; in fact, I am a semi-Pussyfoot; but it was comforting to know one had a wide and costly choice. This year when I bumped into any trade magnate I could see his eye flickering. He was asking himself: "Let's see, have I stood this fellow a drink to-day or not?" Then, having answered his own question in the negative, he would remark cautiously: "Come and have *a small beer* with me, old man!" Cheerless times, my masters, eh, what?

No More Studs?

IN the golden days of yore the super-knut was wont to keep so many motor cycles that impertinent and envious friends used to accuse him of trying to breed them. You cross a Morgan Runabout with a W.D. Triumph, and get a Baby Levis free gratis, or something of that sort. At any rate we used to send our staff panoramic camera down to some moated grange, and come back with a view of the machines owned by J. Dorée, Esq., of Ch. Ch., Oxford—the resultant block would stretch across a double page of *The Motor Cycle*. Never again. These new licences, which you pass on when you sell a machine, have stopped all that. One of our staff, who mingles motor cycles with small car work, calculates that his 1920 mounts would have cost him about £75 in licences at the 1921 rate.

Taxable Weights.

AT the opening of the Show the question of weight was not quite so much to the front as the facts would have justified. The general public are as yet hardly awake to the facts. They have not realised that whether a bicycle weighs 200 lb. or 201 lb. makes a difference of 30s. to its 1921 tax; nor yet that a three-wheeler or sidecar weighing 894 lb. pays £4 tax, whereas one scaling 896 lb. pays the h.p. tax, which may amount to a cool tenner. Nevertheless, those salesmen whose machines were near either of the border lines had fully tumbled to the situation, and it looked as though a lot of new show cards might be rushed out during the week. Most of the light and mediumweights had been on the scales just before this Show. I am not sure that they were not afraid to weigh some of the bulkier passenger machines.

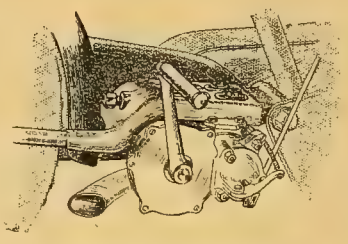


ARE YOU ALL RIGHT? It is safe to say that every motor cyclist who, some time or another, has stopped to effect a repair or adjustment, has heard this familiar question from a fellow rider. It is a courtesy which has done much to build up the great brotherhood of the highway.

LESSONS FROM OLYMPIA.

Tendencies of Modern Motor Cycle Design as exemplified at this Year's Show.

A FEATURE of the 1920 Olympia Show was the fact that almost every machine exhibited has either had a thorough trying out, or else is constructed on such sound and orthodox lines that mistakes are hardly possible. There were, it is true, certain striking innovations, but amongst motor cycles proper these were rarities and could generally show excellent reasons for their departure from standard practice.



On the big Excelsior chain adjustment is carried out by a simple bolt which slides the gear box along its platform.

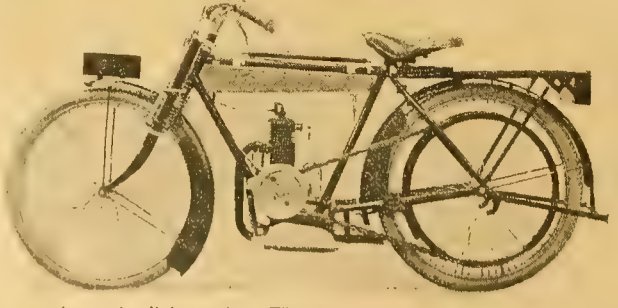
Naturally, the engineer is first attracted to novelties in engine design, and it is noticeable that almost every new or redesigned engine is fitted with mechanical lubrication; the 8 h.p. Enfield, 3½ h.p. Martinsyde, 3½ h.p. and 2¾ h.p. Douglas, 4¼ h.p. Ariel, Superb Four, Corona, and Bradshaw may be mentioned as sufficient examples which may be added to last year's list, while many other manufacturers are contemplating the use of some proprietary pump.

An advantage of the Best mechanical pump is that it is designed to work in conjunction with existing semi-automatic drip feeds.

Lubrication.

Amongst those systems which may be classed as mechanical, though they do not actually employ a pump, is the very interesting scheme carried out on the little two-stroke J.E.S. In this case oil is fed to the main crank bearing by gravity, and passes to the big end bearing through drilled oilways. The connecting rod and gudgeon pin are also drilled, and at the point of maximum piston speed, *i.e.*, about half-way down the stroke, all these oilways are in communication, so that oil is flung by centrifugal force up the connecting rod, into the hollow gudgeon pin and on to the cylinder walls.

Undoubtedly, one of the features which attracted most attention was the new Bradshaw flat twin. Here lubrication is carried to such an extent that it intentionally forms the most important part of the cooling system.

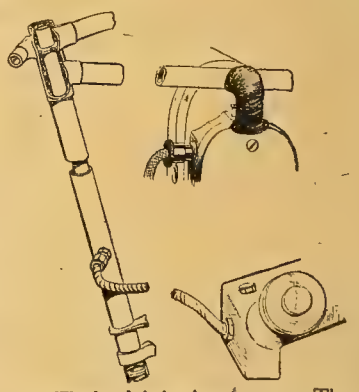


A genuine lightweight. The two-stroke J.E.S. is the 1921 development of the motorised bicycle.

War-time research on aircraft engines demonstrated the fact that nearly fifty per cent. of the heat dissipated by a so-called air-cooled engine took place through the crank case and oil, and this without any special precautions for crank case cooling. It is, therefore, fairly obvious that if the design is specially laid out for the purpose, better cooling can be obtained.

Oil Cooling.

For this reason the cylinders are sunk into a special crank case, and are liberally lubricated by surplus oil forced to the big ends. Special precautions are taken in order to distribute this oil over the whole of the crank case and timing gear so as to make the best possible use of the large aluminium radiating surfaces, and finally the hot oil is withdrawn from the base by another pump and returned to the tank, being cooled in the process of circulation.



The Wooler lubrication system. The oil contained in the air release from the timing case is forced against a baffle at the top of the saddle tube, and, falling to the lower end of the tube, rises to the level of a pipe which returns it to the sump.

Several other lubrication systems of considerable interest were exhibited. Amongst these the Best pump deserves special credit, since, though it cannot be classed as a pressure lubricator, it relieves the rider of responsibility, and is applicable to most present-day motor cycles. The Cyke-laid attachment also comprises an interesting mechanical lubrication system.

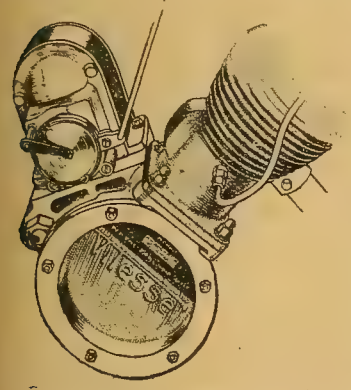
Two-stroke lubrication shows a tendency to depart from the simple petroil system in favour of various methods of drip feed. The Velocette remains the sole example of mechanical pump lubrication in this class, but the Levis

Lessons from Olympia.—

naturally retain its well-known system of separate leads to each vital point. An ingenious system, utilising the exhaust gas as an injector, proportions oil feed to engine load on the Sheffield-Henderson.

Cooling.

We are often told that existing cooling methods are adequate for present-day engines. Be this as it may, our manufacturers have apparently discovered that, as detail improvements raise the power output and efficiency of their engines, better cooling arrangements become necessary. There is ample evidence of larger cooling areas and redistributed surfaces, and these evidences are likely to increase in the future, since better cooling permits of greater power output, and greater power output requires better cooling. There is no doubt that the limit of cooling and power output is not yet in sight, though the Bradshaw engine opens up a new and very promising field.



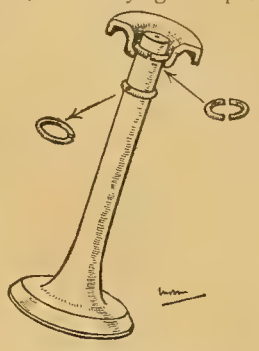
Possessing only one main crankshaft bearing, the Sun has a large detachable cover to the off side crank case.

A most interesting engine, the Superb Four, employs a *monobloc* aluminium casting with steel liners. This method should be excellent, provided distortion does not make its unwelcome presence felt.

With the exception of the little Whippet scooter, the Superb is the only example of aluminium construction, though there are one or two instances of detachable aluminium fins. Speaking broadly, the use of aluminium pistons does not appear to have caught on, possibly because they have in many cases been designed for weight reduction rather than for cooling purposes.

The ultra-light aluminium piston is apt to demand big clearances, and thus produces an objectionable "slap" until it warms up, and until it is more generally realised that a certain amount of metal is necessary to distribute the heat, no very great progress in this direction is likely.

One or two firms who specialise in sporting engines offer a choice of aluminium or cast iron, and several other large concerns are making serious experiments with pistons constructed of the lighter metal.



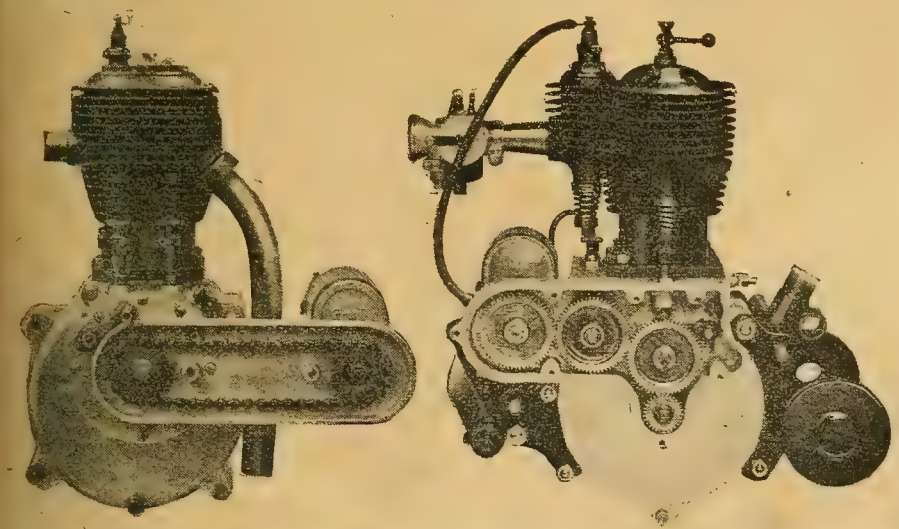
One of the valves of the Superb Four engine showing the split ring at the top for keeping the valve spring cup in position, and the subsidiary split ring below, for preventing the valve falling into the cylinder should a breakage occur.

Two-strokes.

Two-strokes are undoubtedly advancing steadily, and the wonderful speed record of 66.97 m.p.h. over the flying kilometre, established during Show week by a 250 c.c. Velocette, will do much to encourage two-stroke designers. Certainly the average two-stroke is a far superior article to its pre-war prototype, though there is still comparatively little reliable data to help the two-stroke designer. Rotary inlet valves, such as are employed on the Scott Sociable, are likely to gain ground, since, by their use, it is possible to diminish losses in the crank case charge, and thus increase power and improve consumption.

Lubrication and cooling are both capable of improvement from the public's point of view, though both have definitely progressed during the past year. Deflector shapes and piston cooling have made advances, and will continue to do so, though at the present moment there are no two deflectors alike.

The new and enlarged edition of the Cedos is a fascinating little engine, and with its machined ports should standardise performance to a considerable degree.



Two examples of magneto drive on single cylinder engines at Olympia. (Left) On the B.S.A., where a chain is used. (Right) The gear transmission (embodying timing gear) of the Quadrant.

Another feature which requires attention is the ignition range provided on the average two-stroke. By reason of its inherent features, the two-stroke requires a very large ignition range if the best results are to be obtained; yet, since the magneto is driven at engine speed instead of half-speed, the normal range is decreased to just half that of the four-stroke.

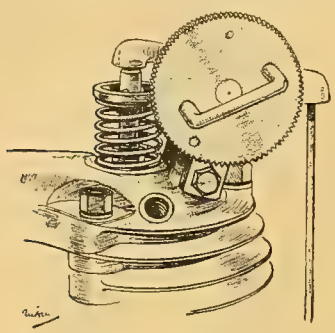
The Villiers flywheel magneto is a distinct step in the right direction, and the popularity of this unit amongst motor-cycle assemblers is sufficient proof of its all-round merit. The Villiers Co. have had such an enormous experience with the small two-strokes that they have naturally developed many little points which might well be studied.

Lessons from Olympia.

It is impossible to leave the subject of two-strokes without mention of the 500 c.c. Dunelt. This engine utilises a double diameter piston so as to increase the crank case charge, and its wonderful performance in the A.C.U. Six Days Trials is proof of its capabilities.

Transmission.

There has been so little change in transmission that the subject may be dismissed in a few words. Messrs. Rudge Whitworth provide two of the only novelties, one a solidly constructed countershaft gear fitted to the biggest twin-cylinder machine entirely produced by any one British firm, and secondly, an all-metal belt, which is said to be "slip-proof" even in water. If this belt proves to be a success, it will add considerably to the popularity of belt-driven machines, and the results of its tests will be watched with some interest. A new gear box is shown on the 5 h.p. Lea-Francis, the Jukes four-speed gear is fitted to the Olympic, and the Comery three-speed proprietary gear is likely to make a splash, since it is very neat and beautifully made, and will be turned out in considerable numbers in the near future.



Instantaneous adjustment device for overhead valve rocker on the Rudge.

Worm drive on the Unibus is a novelty in two-wheeler construction, and the Superb Four and new Wooler chain-driven models are newcomers to unit engine and gear box systems.

Frames.

Few novelties in frame construction made their appearance. The Cotton is already a well-tried proposition, and the only real advance in construction is the general use of steel lugs. New spring frames are few and far between, but the number of auxiliary suspensions is legion: in fact, it is clear that, for the immediate future, manufacturers as a whole are content to look after the comfort of the rider rather than the well-being of the machine. Certain difficulties crop up in designing a satisfactory spring frame, and it would appear that these are being evaded, for the present at any rate. There is, however, a laudable tendency to fit larger tyres, which will help both rider and machine to some extent.

Weight.

Among manufacturers of the smaller class of machine, many are prepared to certify the weight of their products at under 200 lb. This is as it should be, but there are still too few of the 3½ h.p. class who have managed to turn out a fully equipped machine at under the 30s. taxation limit. The 3½ h.p. twin Dot-Jap is a good example, but perhaps the best instance in the Show was the 4 h.p. Coulson. Here we find a machine fitted with a standard 4 h.p. Blackburne engine, Sturmey Archer three-speed gear and spring frame, weighing only 196 lb., and yet the weight reduction has not affected the strength of any vital part. An examination of this machine proved most interesting, and close inspection was required in order to discover the ingenious methods by which unnecessary poundage had been avoided.

On the other hand, at least one 3½ h.p. single-geared machine tips the beam at over 200 lb., though there is no apparent reason for this discrepancy in weight. Unsatisfactory as the new taxation appears, from the motor cyclists' point of view, it may at least have the advantage of inducing manufacturers to discard excess weight, and once improvement is started in the smaller classes it is bound to spread to the heavier types.

Gadgets.

There are perhaps fewer of those neat little fittings to assist the rider in maintaining the tune of his engine than usual, but Messrs. Rudge-Whitworth, who have already introduced the neatest and quickest belt tensioning device in existence, showed this year an instantaneous adjustment for their overhead inlet rocker. Briefly, this consists of an eccentric rocker pivot pin, which can be rotated by the rider while the machine is in motion, thus compensating for any expansion when the cylinder warms up. A very fine adjustment is provided, and the device locks itself by means of serrations which engage with a deeply milled wheel on the end of the rocker pin.

Another very handy device is the arrangement by which the carburetter of the Bradshaw engine may be moved laterally to correct uneven distribution. This also may be done whilst the machine is in motion; in fact, I am informed that J. L. Emerson has performed the operation at speeds in excess of a mile a minute on Brooklands.

Lighting.

No observer, however casual, can have failed to notice the extraordinary increase in electric lighting for motor cycles. Following on the success of the Lucas Magdyno, the M-L Maglita has got a firm hold on the less luxurious machines, while the new B.T.H. lighting set for two-strokes would undoubtedly have graced many of these little mounts had it been in production a week or two earlier. Besides this, such firms as Messrs. A. H. Hunt have introduced accumulator and battery sets for those who do not care to go to the extent of utilising a generator. Other first-class systems were to be found in the Gallery, notably the Rotax; and most American machines are supplied with self-contained lighting plants.

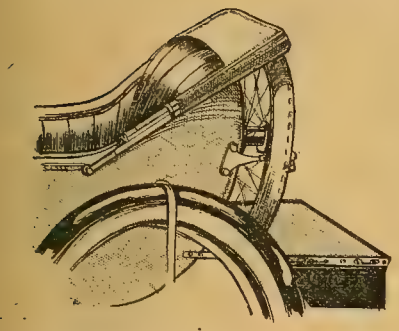
UBIQUE.

COMFORT AND CONVENIENCE.

1921 Sidecars from the Passenger's Point of View.



A convenient place for a tool locker is under the luggage platform, as on the A.J.S.

AT last week's Exhibition it was not only the mechanics of a motor cycle which interested prospective purchasers of sidecar outfits. It was apparent that motor cyclists have learned to consider their passengers' comfort.

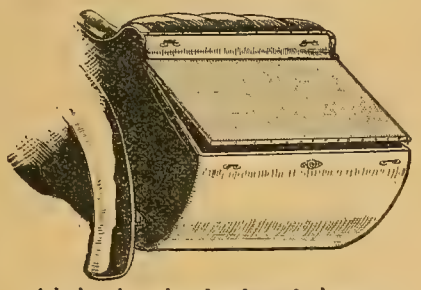
Among the visitors there were buyers who were accompanied by their wives or *fiancées*, and many were passengers of experience. This fact was obvious by the questions they asked, and the points they examined for themselves.

This interest in the sidecar portion of an outfit on the part of the passenger no doubt resulted in many a debate until a compromise was found to satisfy both mechanical driver and meticulous passenger. At the present moment probably there are men who have dreamed during the summer of a light sporting outfit, who are reconciling themselves to a larger machine in order that the demands of their passengers are fully met.

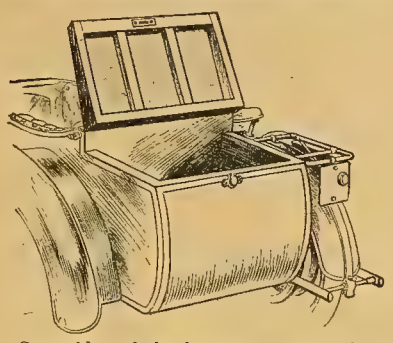
Many Improvements.

"Much" almost invariably "wants more"—it is a perfectly natural sequence in most things. No one wants to take a retrograde step, and there are few who motored this year who cannot suggest some little improvement for 1921.

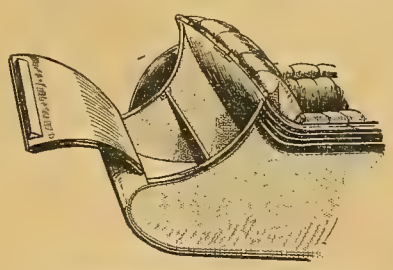
A visit to Olympia made at least one thing certain. There are many improvements in sidecars to give their occupants greater comfort. That many designers now ride in their productions is obvious to all who are passengers, just as it is clear that some of the sidecars have not been produced with full consideration of the passengers' convenience.



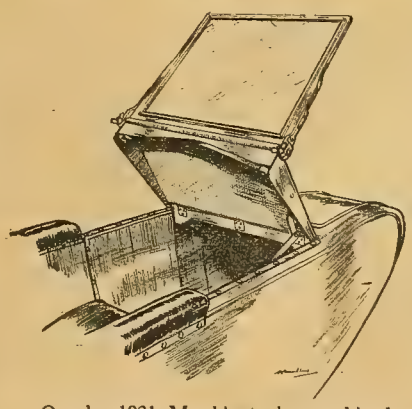
A locker that takes the place of a luggage grid is a feature of the new Ariel sidecars.



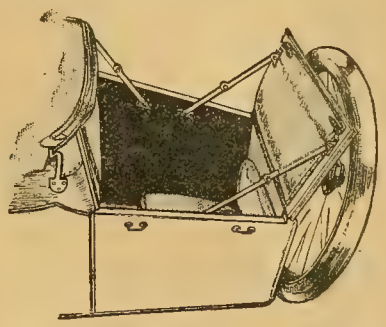
Some idea of the large luggage capacity on the B.S.A. sidecar may be gathered from this drawing of the opened locker.



In the Sandum touring model, the rear locker has partitions, conveniently dividing the space.



On the 1921 Matchless, the combined windscreen and dash hinges forward when the passenger desires to enter or leave the sidecar. This hinged flap eliminates the necessity for the passenger's apron.



The Rex dickey is contained in a boot, after the fashion of the car.

We refer to the several comparatively high-sided bodies without doors which were not equipped with a step. One wonders what would happen if our laws were as they are in China, where a lady was recently imprisoned for revealing her ankles. Even with fashions and the standards of decorum as they are to-day in this country, it is difficult to imagine a member of the fair sex entering or leaving such a sidecar gracefully.

That it is quite easy to give the passenger the convenience of a step in this type of sidecar is well illustrated by the Sheffield Henderson and several others. Even on a touring sidecar with a door a step is a convenience still overlooked by a large number of makers, although the number so fitted have considerably increased.

The Seat Locker.

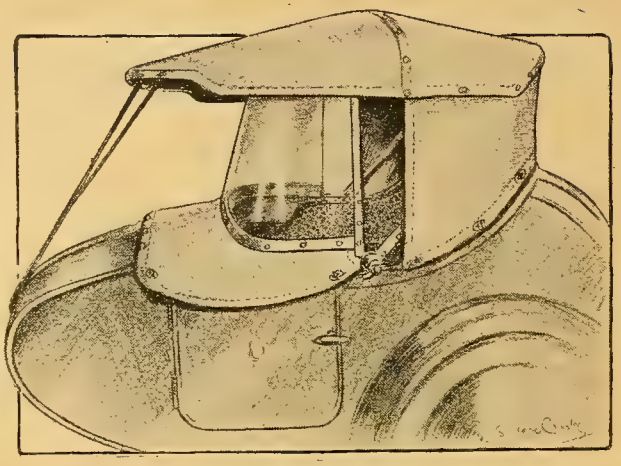
An outstanding feature of the new sidecars is the amount of locker space available in the touring models, and some of the small sporting attachments have commodious lockers in the rear part of the body. The sporting models of the Montgomery and Grindlay are good examples of the latter type.

That abomination of most passengers, the seat locker, is still almost general practice, and while one must agree that such lockers utilise space that otherwise would be wasted, in use they cause a great deal of inconvenience through lack of consideration on the part of the driver who sometimes stores therein many things he should carry in his tool bag.

Seat lockers should only be used for such things as accumulators, and items which should not have to be disturbed in the course of a run.

Comfort and Convenience.—

Glove lockers in the after end of the nose panel are a convenience when they are not so far forward under an apron as to be rendered almost unreachable. The increasing popularity of the hinged dash may bring about a change in position of the glove locker, which has happened in the case of one of the Dunhill models.



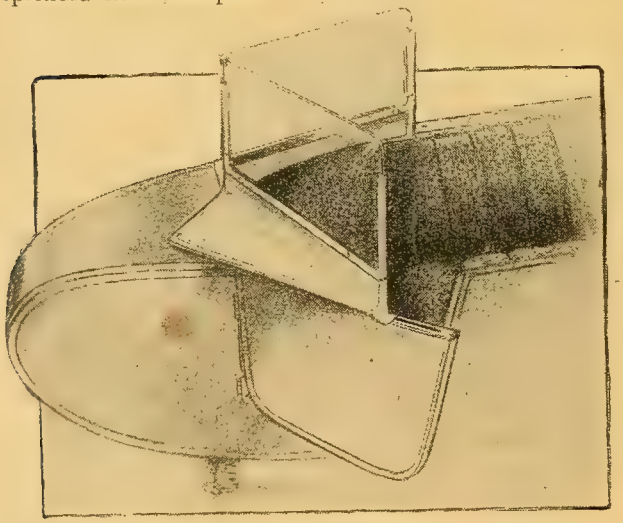
A Millford hood and screen.

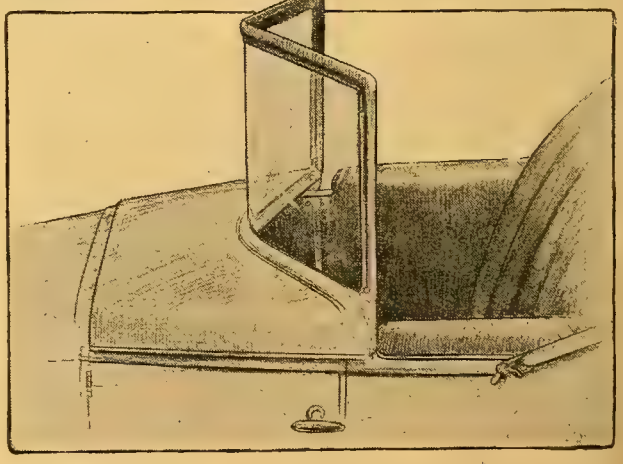
Luggage Lockers.

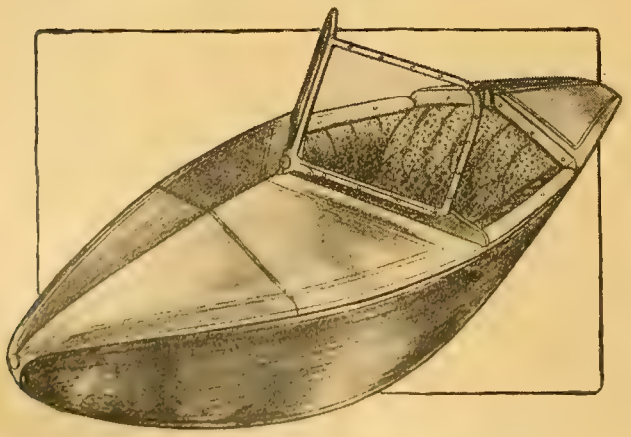
No touring sidecar is now regarded as complete unless it has a rear locker. At Olympia rear lockers varied in size and shape from those sufficient for a few spares and a kit of tools to others so large that the need for a luggage grid is eliminated. The latter type represents one of the chief improvements in 1921 sidecars, of which the Ariel and B.S.A. outfits are splendid new examples.

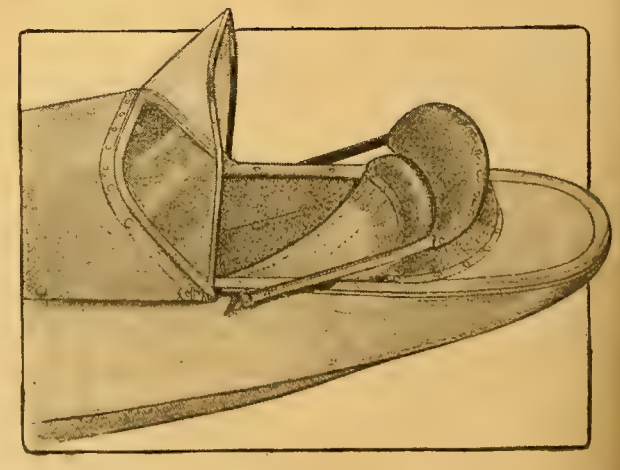
Probably half the sidecars offered for 1921 have what is erroneously termed the bulbous back. These models have curved backs and provide space for large lockers which, in the Matchless and several others, have been subdivided to take petrol can, tool kit, etc. In one of the Rideezi models, the locker lid may be utilised to serve as a picnic table.

One could write much more of the various types and positions of lockers than space permits, but to those interested in this subject, attention is drawn to the small tool box (which might easily be a little larger) on the luggage platform of the A.J.S.; the compartment between the mudguard and body of the Enfield and the capacious lockers in the rear panels of the Rudge, Norton, Millford, Watsonian, Sheffield-Henderson, and B.S.A. sidecars.







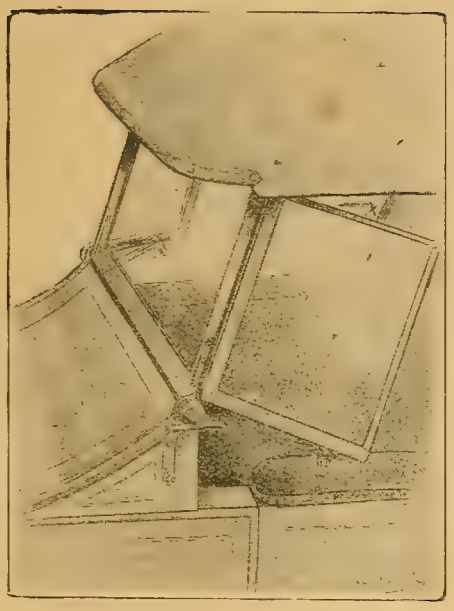


1921 FASHIONS IN WINDSCREENS. Top (left): Watsonian folding V screen opening automatically with the door. (Right) The Excelsior V screen. Bottom (left): The C. and M., which has a hinged dash and V screen. (Right) The Canoelet with hinged back rest.

Comfort and Convenience.—

In the case of the Canoelet and Grindlay, the rear locker is fitted up with a juvenile's dickey seat—another feature of this year's Olympia sidecars. The interest of the family man in such sidecars was very evident, and the Rex *de luxe* outfit came in for quite a lot of attention in this respect. (We are not now referring to the two-seater taxi sidecar exhibited by this firm, but to the special long chassis model with car type dickey seat inside the boot.)

The demand for extra accommodation for the youngster of eight to twelve years of age is now well recognised, and several makers, including the Excelsior and the Millford, staged machines with tandem bodies suitable for an adult and a child, while an A.J.S. was shown with a special additional seat made to take the place of the luggage grid.



Side screens are a feature on the Clyno.

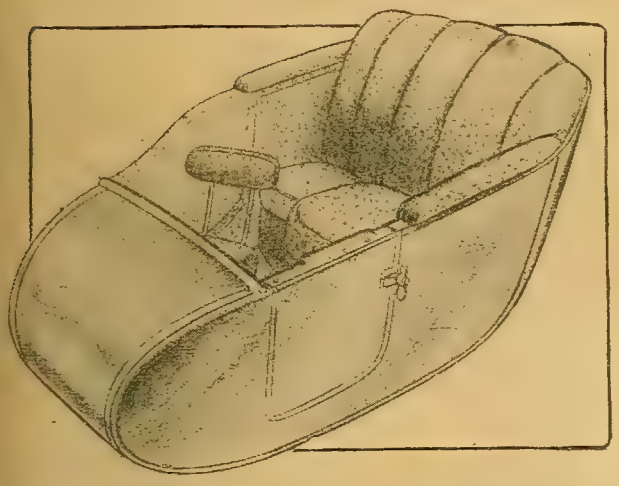
Not every maker has attempted to improve his hoods, which suggests that they have yet to undertake a journey under one of them on a rainy day. Many designs still show those gaps which set up such unpleasant draughts when the hood is used. There are exceptions, of course—several of them in fact, and in this direction the Watsonian models are of interest.

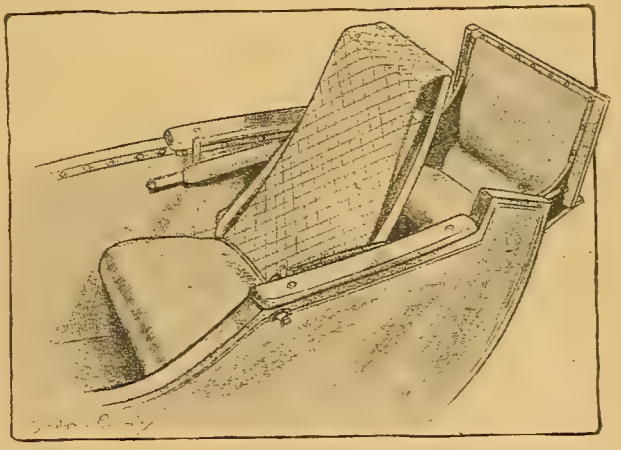
In one of these, there is a combined dash, screen, side windows, and hood, which is hinged at the rear to allow ingress of passenger. In fine weather the hood portion may be removed.

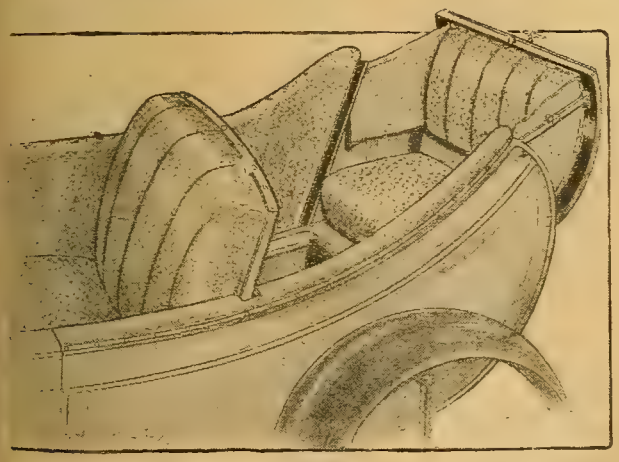
Screens.

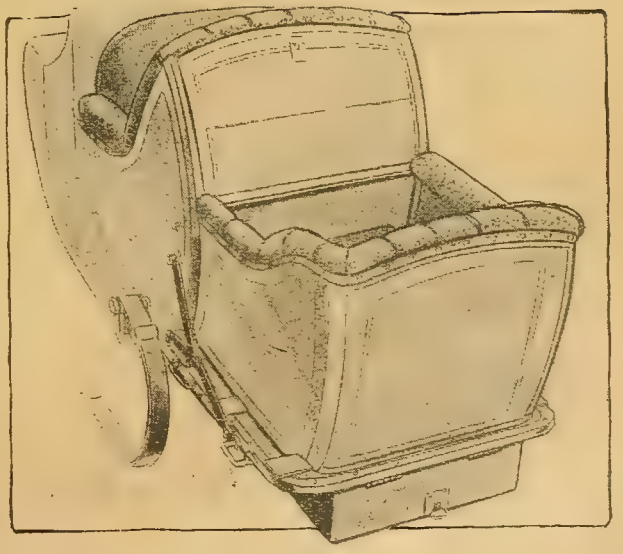
Screens are much improved. Very few are now offered fitted forward of the door, in which position they set up a decided draught unless a long *and high* side screen is fitted. On the new A.J.S. the hinged dash and screen is raised

EXTRA SEATING ACCOMMODATION.









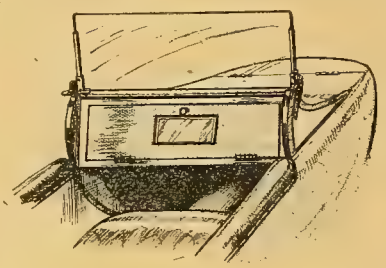
(Top) Dunhill and Plus-one models. (Bottom) Sandum "Convertible" and A.J.S. "dickey."

Comfort and Convenience.—

several inches, an improvement from the passengers' point of view, but one which motor cyclists may not consider an improvement to the appearance of the machine. In addition, one of the A.J.S. machines had a high side screen of talc which most passengers will appreciate.

On one of the Montgomery models also the screen is mounted well back and high, but in lieu of the hinges the dash has an apron serving the same purpose.

Those who appreciate the comfort of the Easting screen will be interested to know that in future it will provide a convenience not available with the older types. We refer to the new model which is mounted on long arms pivoted at a point forward of the door. Quite a large number of motor cycle makers, including the Royal Ruby and B.S.A., are standardising these screens.



A glove locker in the hinged dash of the Dunhill touring sidecar.

Upholstery.

The "padding" and upholstery generally is much better than it was a few years ago, but on the whole the quality of 1920 has not been improved vastly.

Spring seats and backs are now almost general, but some back cushions—squabs they are usually termed—appear to be somewhat hard. Most makers retain ribbed back cushions, and unless these are well sprung, they are not nearly so comfortable as the flat surface; in addition to which, they collect the dust and are less easy to clean.

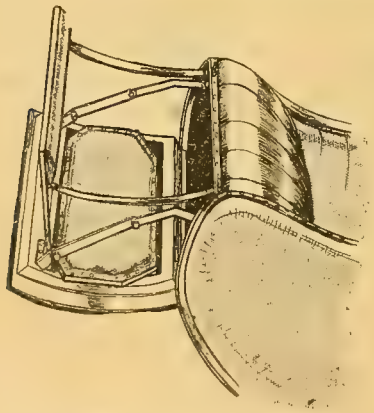
Width of Body.

All makers have not yet appreciated the extra comfort provided by a body which is a little wider than the average. The B.S.A. sidecar is excellent in this respect, but quite a number are still so narrow that it is impossible for a person of average build to sit in them with both elbows inside the body. Some of the largest looking sidecars lack this extra inch or so. Also there are many passengers who may consider that the seats are a little too high to obtain full benefit of the screen. This latter point, of course, hinges upon that of width, as, with a narrow body, the passenger would be uncomfortable on a low seat if the arms still had to rest on the sidepads.

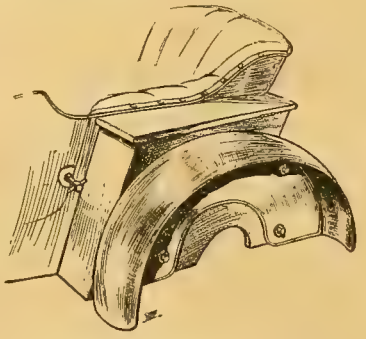
In these connections, it would be well if makers forgot the hackneyed phrase "as comfortable as an armchair," as sidecar passengers require more than a chair to sit *on*. Far better is it to provide them with a body to sit *in*.

One other criticism may be levelled at the makers of 1921 sidecars by those who used their machines throughout the past wet summer. Few makers have taken measures to prevent water draining on to the passenger's knees through the joint of the hinged dash. The hinged dashes are the worst offenders in this respect, but some makers fitted a double apron at the front end of the well, one fastening on the top and the other underneath.

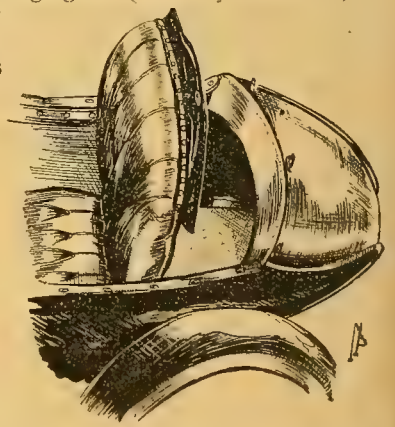
To summarise, one may say that quite a number of sidecar designers would obtain valuable first hand information regarding the comfort and convenience of their productions if they acted as passengers in a wet London-Exeter run; but taking them all round, in the 1921 attachments the passengers' comfort and convenience has been carefully studied and, as in the machines that propel them, there is ample evidence of real progress. Springing has certainly advanced, and real comfort may now be expected from most sidecars offered.



Several 1921 models have a juvenile's dickey seat in the rear panel; the Grindlay shown above is one of them.



The Enfield locker that utilises otherwise waste space between the mudguard and the body.



Even on the smallest sidecars there is generally good locker space at the rear of the body. This is the Sporting Montgomery.

THE VALUE OF SERVICE.

EVERY day our mail bag brings us appreciative eulogies from our readers regarding the excellent treatment meted out to them by various manufacturers and dealers. Only a small percentage can be published, but the expressions form rather a striking but none the less pleasing contrast to the state of affairs existing a year or two ago. The letters vary greatly in stating the character of the treatment accorded, and these differences could not be fairly indicated in a *précis*.

We therefore suggest that satisfied owners should not fail to express satisfaction to those enterprising firms who are ready to extend "service" to their clients.

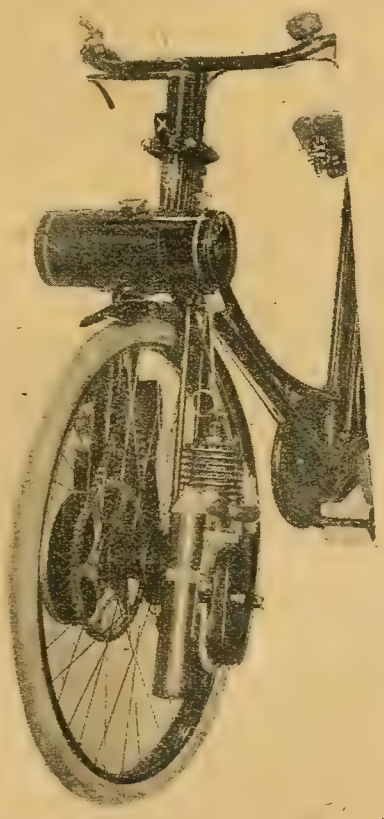
Impressions of the 1921 Models exhibited at Last Week's Show.

I REALLY do not know why the press forecasts suggested that the emphasis of the Show was going to be "safe" rather than Winston Churchilly—which term I interpret to mean a foundation of great soundness, illumined by occasional flashes of brilliance and spasmodic lapses into excitement. There has never been any show which housed so many stolid and reliable machines, capable of giving a duffer 364 days' hard service in the year; and their staunch British respectability was pleasantly diversified by a few outrageous freaks and by a few audacious newcomers, which may or may not settle down into humdrum sobriety later on.

Far too much plating everywhere, if I except the all-black Humber and the Superb Four. One veteran with a tear-stained face led me into Addison Road and showed me a £250 outfit with a colour scheme reminiscent of an Orangeman's beanfeast. "How long have I had her?" he demanded. I scanned the rust observantly and hazarded "Three years?" "One month!" he blubbered. "It's their blanky plating and this blinking climate that does it!"

Gears, Lights, and Brakes.

Honest efforts are discernible to make gear changing easier on the Comery, Rudge, and other new gear boxes. Electric lighting is boosting busily; the Magdyno, Maglita, and B.T.H. outfits sound the knell of gas. The front stirrup brake is moribund, though a front wheel brake which cannot possibly rattle is still a rarity. We want a brake which, like the internal expanding pattern, is held positively "off" as well as positively "on." Dozens of machines are unnecessarily heavy, as the 4 h.p. Coulson with three-speed gear and spring frame at 196 lb. clearly indicates. But if those three minor accusations are written off, there is no comprehensive criticism to be made; and it must be admitted that lots of riders adore plating, prefer gas lamps, do not see red when they are given a stirrup brake, and make standard machines far heavier than they are designed to be by adding uncountable gadgets and an extra passenger.



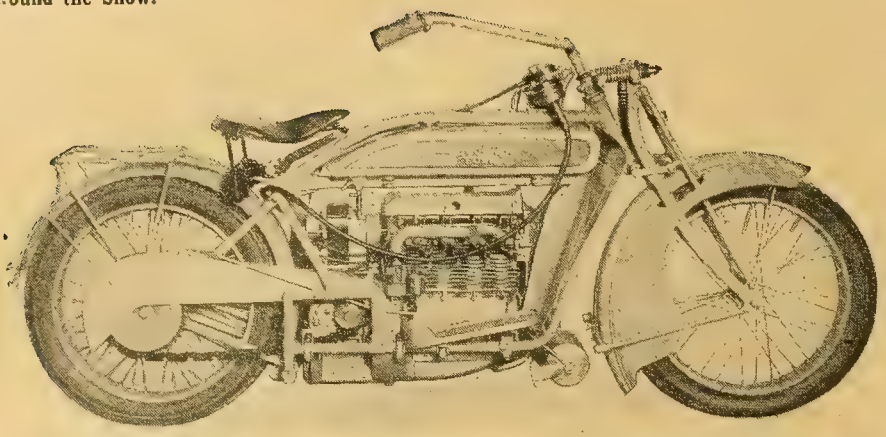
Cykelaid front wheel driven motorised bicycle.

The bulk of next year's touring and medal-winning will, as usual, be done by the staid familiar 'buses which we all know so well, and which are a little better than they ever were. We all know that, but, like the Athenians, we are fond of gassing about the new stuff at Show time.

The Chain-belt.

The Rudge belt? Opinions differ. It is either a desperate or a brilliant endeavour to prevent the decease of belt drive on heavy touring machines. It is twice as heavy as a rubber belt; it is twice as dear (10s. a foot); it looks as if it might be noisy; it conjures up visions of steel gaiters in my neurotic mind. On the other hand, if its working life is 5,000 miles, the all-weather rider need not despair of that most lovable of all gears—the variable pulley. Should it prove all it is said to be, it will see a great future on cars for driving dynamos and fans.

Round the Show.—



Britain's challenge to American and Belgian designers of four-cylinder motor cycles—the Superb Four.

Bradshaw's new engine? This obviously cannot be judged in connection with the hasty installation which had been rigged up against time for the Show. Move its oil tank—the heart of the design—to a less vulnerable position. Shield its carburetter from mud. Improve access to the tappets. Let it do a London-Exeter, or do a Brooklands record or two, and we shall all be falling over ourselves to get hold of one.

The new sports Douglas? Here at least, there is nothing experimental. A light hog 'bus, with "light" and "hog" heavily underlined. Just what so many of us have been wanting. An obvious flier, on sound lines, with one of the biggest motor cycling names on the earth behind it.

The big Rudge twin? Will somebody please pen a motor cycling parody of the song "Sailor, beware!" substituting the words "Injun" and "Harley" for "sailor" in verses one and two? Sung by Harry Dearth at an M.C.C. dinner, this number would bring the house down, and put W. H. Wells into his most defiant mood.

A British Four.

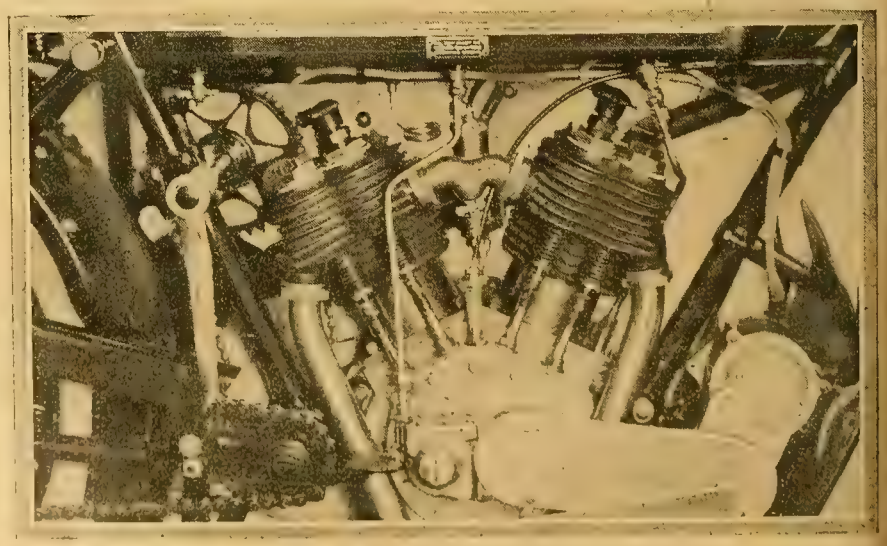
The Superb Four? Sceptical to the core, I cannot accept Mr. Hooper's estimate of 250 lb. for its weight: why, that is only 14 lb. more than the solo Sunbeam. Still, weight doesn't matter so very much for sidecar work. I deplore the magneto position. £220 is a *de luxe* price for a *de luxe* machine. But the technical design is just what anybody who is keen on aero engines had hoped to see. There are plenty of men ready to pay for the best; let this dazzling specification once make good on the road, and a large *clientèle* awaits it. In the meantime hearty plaudits to Mr. Hooper (and no less to Mr. Bradshaw) for offering us a motor cycle lubrication which is as automatic as the action of the liver, *i.e.*, you never need think of it until it clogs. Let us commend to other designers Mr. Hooper's notion of a motor cycle instrument board—a little fan-shaped aluminium plate just beneath or behind the steering head: it is a million times neater than the usual cross tube between the handle-bars, on which the gadgets are hung out like the week's wash.

The New Hudson was the sole genuine *débutante* in three-wheelers, and it got enough attention to turn its chassis a bright Indian red. I saw and heard many a leading engineer utter his verdict on it; and very few of them could find a "crab." One or two challenged the shape of the inlet manifold (which I guess to have been deliberately designed for "distribution" purposes). Otherwise the general judgment was "A sound job: but how on earth can they do it at the price?"

There was great joy among the fair sex: for are not all the baby two-strokes coming out with clutches and kick-starters? A girl may wear breeches without relishing the jump mount. The New Hudson "Ace," with its 50 m.p.h., is going to remove the reproach of "pottering" from this class; but there will be much trouble with the police if no silencer is fitted. Are the makers not aware that the two-stroke enthusiast who arrives home at 2 a.m. is already classed by his neighbours in the same category as hawkers and barrel organs? Two-strokes want more silencing, not less, the Scott alone excepted.

Genuine Sports Mounts.

New sports models are plentiful. The Brough hadn't materialised at the time of my visit, but the knuts were already feverishly oscillating between the Zenith, N.U.T., Rover, Douglas, and Norton stands. One sportsman was heard to remark that if only the Brough sports model had been 7 h.p. instead of 3½ h.p.—! The Dunelt people seemed to be doing good business, for the average two-stroke enthusiast wants more power, and this 500 c.c. single offers power at a rock-bottom price. Alternatively, the Velocette and Levis people propose to extend the road



"Made like a gun"—the Vickers engine in the 1921 Royal Enfield.

Round the Shows.—

range of their smaller engines by fitting three-speed gears. The Velocette was a regular cynosure for hard-riding light-weight men, and the delay in producing the three-speed Levis was a bitter disappointment to many visitors—I can assure the makers that it is eagerly awaited.

I understand that the new works consecrated to the production of the big Raleigh flat twin are almost ready. Flat twins are now almost as numerous as bureaucrats, but a special welcome is ready for this excellently designed and beautifully made machine. I marked it down last year as one of the very best machines in the Show, and when deliveries begin, I prophesy that it will take a very high place among the elect.

3½ h.p. Scott Squirrel—a T.T. type of solo mount.

The sidecar taxicabs excited equal interest and derision. Few of us can afford to patronise the four-wheeled pirates of the streets at all lavishly, and these machines ought to do well. Design is not yet stabilised. One of them had no accommodation for luggage, for example, and any ordinarily stout matron would unquestionably jam in its narrow slit of a doorway. Near by stood another which could certainly take two average passengers, plus 2 cwt. of luggage on the tailboard. I have not the least wish to earn my bread as a sidecar taxi-driver during a British winter; but such a machine will form a happy mean between the motor omnibus and the taxicab when it gets on the streets. Many manufacturers are dreaming of a lucrative and steady trade in these new models. The innovation of large fleets of sidecar taxis will do a world of good to the trade—your big commercial user is dead nuts on running costs, reliability, and ease of repair: he would ginger up design faster than hundreds of private users could ever do.

I feel rather like a married man does when he returns to the bosom of his family after an evening at a variety show, and reflects that he winked twice at the prettiest chorus girl. For have I not devoted nearly the whole of my limited space to new machines, which we may or may not see again: and ungratefully neglected those well-tried companions who have made our lives run more smoothly for many a year past. Still, a couple of winks don't matter very much, do they?

CIRCUIT DE PARIS TRIAL.

A Successful Continental Event near the French Capital.

A RING around Paris at an average speed of eighteen miles an hour for a distance of 108 miles, with a couple of test hills thrown in so as to determine the best of the clean score men, constituted the Circuit de Paris motor cycle and cycle car trials. This event, which was run for the first time last year, and will be made annual, brings the competitors in contact with all kinds of roads from almost impossible *pavé* to perfect macadam, and, although not of international importance, it attracts a lot of local attention.

Of the forty-two entrants, thirty-two faced the starter, and twenty-seven finished within the time limits and took part in the two speed tests on the Flins and Marly hills. Included in the above were two miniatures, which went through the trials without a hitch, and were not the slowest on the hills. The machines were a Skootamota ridden by Antony (an amateur who seems to divide his time between this little machine and a 90 h.p. racing Fiat) and a C.D.R. Motopatinette ridden by Dieudonné.

The machine to head the list, irrespective of classes, was an Indian ridden by Coquildi, with Cletch on a Motosolo in second place, and Rabot on a Harley-Davidson third. These times, however, were not of very great importance, for they only served to give a merit list after the essential part of the programme had been fulfilled.

Only English machines, or rather machines of English design, took part in the cycle car section. They were three Morgans and six G.N.'s. Both these makes are now manufactured in France, the G.N. having been taken up by the Salmson Co., a firm which specialised in aviation engines during the war. Fastest time on the hills was made by Darmont on a J.A.P.-engined Morgan, with his team mate, Franquebalme, second on a similar machine. The M.A.G. Morgan was fifth in this class, and the G.N.'s took third, fourth, sixth, seventh, eighth, and ninth places. Speed contests are a feature of most Continental trials.

Sidecars re-starting after the luncheon stop in the Circuit de Paris Trial.

FURTHER DETAILS OF THE NEW LICENCES.

The Form and Position of Licence Card to be Displayed. Three-wheelers over 8 cwt. to Pay Car Taxes.

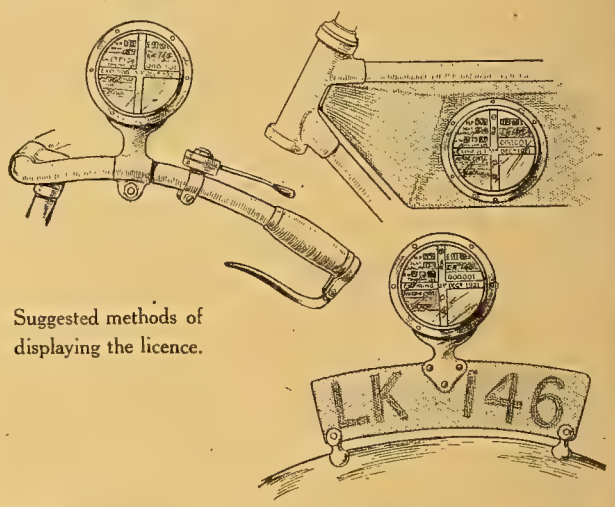
IN *The Motor Cycle* of November 25th we were enabled accurately to forecast the new taxation scheme, and now, thanks to the Ministry of Transport, we are able to give our readers some further details concerning the new licences, which come into force on January 1st next. The whole scheme was explained to members of the press by two experts of the Ministry of Transport one day last week, and those attending were invited to ask questions. It was interesting to observe that the majority of those present were quite incapable of asking for intelligent information concerning the new taxes, as they were clearly not practical motorists.

Every possible facility was given to the press, and questions were answered as clearly as possible, but naturally in a somewhat indefinite manner, as nearly all Government regulations are somewhat indefinite, the attitude being that the Government makes the law, but it is not its business to interpret it.

What is Unladen Weight?

We first naturally asked for information concerning the weights of motor cycles. Would machines have to be weighed before being registered? Would a maker's certificate be accepted, or would the owner's word be taken? The official then courteously explained that a maker's statement would be accepted, and in most cases the owner's word. The officials would have a fair idea of what certain machines weighed, but in the case of any doubt the applicant for the licence would be asked to prove his statement.

We next interrogated the official on the question of accessories. Were they or were they not included? The answer was, as forecasted in the issue of November 25th, that the weights will be less fuel and oil and loose accessories, such as horns, lamps, dynamos, speedometers, watches, clocks, badges, and tools. It was also stated that the exact definition of "weight unladen" has not yet been decided.



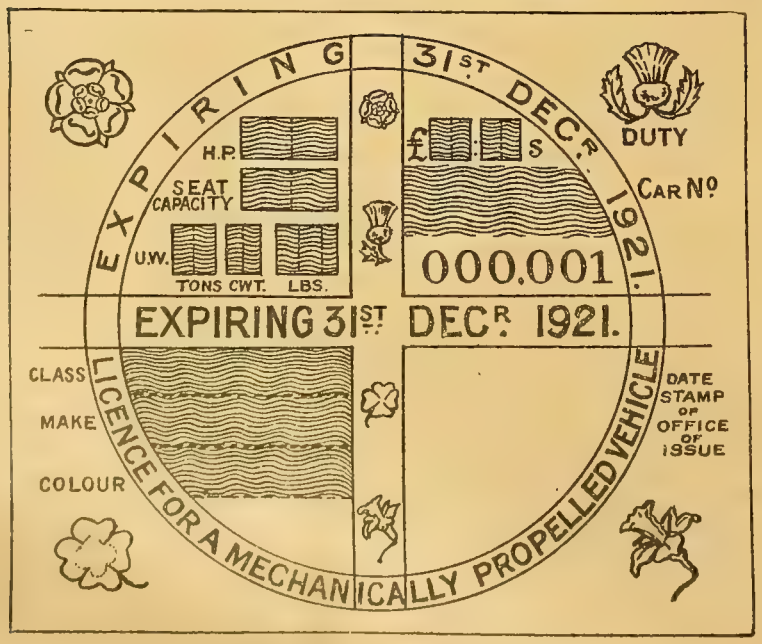
Suggested methods of displaying the licence.

Regarding the position of the licence card and holder, a reply was given to the effect that it might be placed conspicuously anywhere on the machine where it would be clearly visible from the near side.

It would appear that the following positions on the motor bicycle would have the approval of the authorities: *(a)* Carried like an A.C.U. or other badge on the handle-bars (near side); *(b)* like a club badge over the front number plate; *(c)* the case might be fitted to the front portion of the near side of the petrol tank by the manufacturer.

In the case of sidecars a good position would be: Screwed on to the bodywork forward of the door.

The first part of the meeting was devoted to the explanation of the Bill, and most of this explanation is covered by our previous article on the subject.



A reproduction of the new licence card.

How to obtain the New Licences.

As is now the case with the local taxation licence, the new licences (which, of course, include the registration) will be obtainable at any Post Office issuing money orders, and the declaration form will ask for all particulars necessary for registration. The first time a licence is supplied, however, though the forms may be issued by the Post Office and the money paid there, the forms must be sent on to the local licensing authority. When a renewal is required after a year's use the procedure will be much more simple, and the whole business may then be transacted by a Post Office.

After the forms have been filled up two documents are issued, which are the licence

Further Details of the New Licences.—

card and the licence registration book. This latter is to be kept at home, and contains a history of the vehicle from January 1st, 1921, and onwards. It was especially emphasised at the meeting that, whereas the present local taxation licence entitled a man to keep one motor vehicle and is of the same nature as a dog licence, not being transferable, the new licence belongs to the vehicle and goes with it. Change of ownership and particulars of sale must be entered in the log book and sent to the local authority.

Definition of Taxes on Weight Basis.

In this book, which is devoted to motor cycles (including scooters and cycles with auto-wheel or other motor attachments), it is mentioned that motor cycles exceeding 8 cwt. in weight unladen are chargeable with duty as cars. The taxes are thus defined:

Weight unladen not exceeding 200 lb., £1 10s.

Weight unladen not exceeding 200 lb., with right to draw trailer or sidecar, £2 10s.

Weight unladen exceeding 200 lb., but not exceeding 8 cwt., £3.

Weight unladen exceeding 200 lb., but not exceeding 8 cwt., with right to draw trailer or sidecar, £4.

Tricycles not exceeding 8 cwt., weight unladen £4.

Part year licences of one-half the full rates are granted in respect of motor bicycles and tricycles first used on or after October 1st of any year.

If the motor cycle is already registered a second part of the form must be filled in, on which must be stated the registered number, the nature of the vehicle, if used for a sidecar, the manufacturer's name, type or model of vehicle, manufacturers' horse-power, and the weight unladen.

Now, as regards the licence-holder and licence card; these are issued in two patterns—rectangular, intended chiefly for industrial vehicles, and a circular pattern for touring vehicles, such as motor cars and motor cycles, the size to be the same in both cases. The card when supplied is rectangular in shape, but may be cut round the outer of the two circular lines so as to fit neatly into a sheet metal tray of suitable thickness, having a turned-up edge of sufficient depth to hold the card and a stout cover glass. There will also be an outer cover consisting of a ring of sheet metal shaped to fit closely on to the tray, and adapted for fixing by screws, bolts, or otherwise in a position in which it may be clearly seen from the near side of the vehicle. A rubber packing ring should be arranged to fit between the ring cover and the cover glass and tray so as to render the whole carrier waterproof. The aperture within the ring cover should clearly exhibit the whole of the licence card, lying within the inner circle of the licence card, and should have a diameter of $2\frac{11}{16}$in. The actual dimensions of the card issued in its rectangular shape are $3\frac{9}{32} \times 3\frac{27}{32}$in.

In the course of the proceedings it was mentioned that the money collected from the duties, together with the existing horse carriage licences, would be collected by county councils, county boroughs, or borough councils under the supervision of the Ministry of Transport, and will be devoted to the maintenance and improvement of the roads. Licences need only be taken out in respect of vehicles which are actually in use.

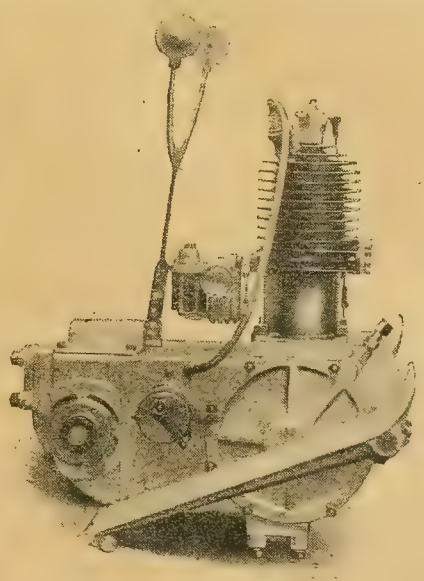
French Engine Design.

A Two-stroke Engine Unit with no Exposed Working Parts.

A VERY neat type of unit constructed engine and gear box for motor cycle use has been produced by the Ballot Cie., of Paris. This firm has specialised for a number of years in engines for car use, and supplies these for a large number of manufacturers both in France and abroad. The adoption of a power plant for motor cycles is, however, of recent date. It is understood that the whole of the present production has been secured by one of the leading French firms for their new types of machines; other firms, however, will adopt the Ballot engine as soon as production increases.

The engine is a single-cylinder air-cooled two-stroke, mounted on an aluminium crank case. A valve is mounted in the cylinder head, but this is only used to relieve the compression, and allows the machine to be ridden without interfering with the carburetter and ignition controls. Crank case compression is employed, and the aluminium piston is fitted with a deflector. Ball bearings are fitted for both the crankshaft and the connecting rod big end. The crankshaft is of the built-up type, consisting of two full discs united by the crank pin, which has conical ends fitting into the discs.

One of the features of this engine is the enclosed magneto, only the distributer of which is outside. Magneto drive is by means of a roller chain, naturally enclosed. A metal disc clutch, working in oil, is used, and there are two speeds operated by lever with forked arms, so as to encircle the tank and horizontal tube of the machine. With the exception of the pulley or sprocket for the final drive, there is not a single exposed working part on the Ballot engine. Even the kick starter is enclosed, and is operated by means of the right-hand footboard.



The Ballot two-stroke engine and gear unit, embodying an enclosed magneto. The gear change is effected by the knees of the rider by means of a double lever.

This engine was exhibited at the 1919 Paris Salon in an earlier form. Since then, however, it has undergone detail modifications only. It is interesting to note that the majority of French motor cycles are fitted with engine and gears constructed on the unit system, and the Ballot product adds another example to the list. The Blériot and Louis Clément machines may be cited as excellent examples of unit construction, especially the latter, in which case a clutch and three-speed gear box are combined with an original design of twin-cylinder V type engine, having shaft operated overhead valve gear. Many capable engineers consider that unit construction will be adopted eventually in this country, though at the present moment British examples could easily be counted on the fingers of one hand.

SIDECAR PROGRESS.

A Review of Sidecars for 1921, compiled from our Stand-to-stand Inspection at the Olympia Show.

A.J.S.

A. J. Stevens and Co., (1914), Ltd., Graisley House, Penn Road, Wolverhampton.—A new design of chassis has been under consideration by the makers of the A.J.S. combination, but the testing of it is not yet completed, so that it has not been shown. Consequently, there is little alteration in the chassis of the present A.J.S. The chassis is of very simple type, sprung on luxurious C springs and having support on both sides of the sidecar wheel. The body also has been found too satisfactory to need any extensive alteration, but one or two detail improvements have been made. The windscreen has been raised two inches, although the glass itself is less deep; the increase in height has been obtained by adding a considerable lift to the scuttle. This at the same time enables the makers to allow more knee room, so that a child can easily be carried as well as an adult. The hinged joint between the windscreen and body has been made completely watertight, and care has been taken to adopt a hood to which the front edge comes well over the windscreen, so as to make a raintight joint there also. A large luggage grid and tool box are fitted, on the top of which a dickey seat can be added.

ALECTO.

Cashmore Bros., Grove Road, Balham, S.W.12.—The sidecar fitted to the 345 c.c. Alecto two-stroke is of the light coachbuilt variety, aluminium panels being used for the sake of lightness. It is mounted upon a conventional type of underslung chassis, with double-ended C springs.

Switches and accumulator in an Alecto sidecar.

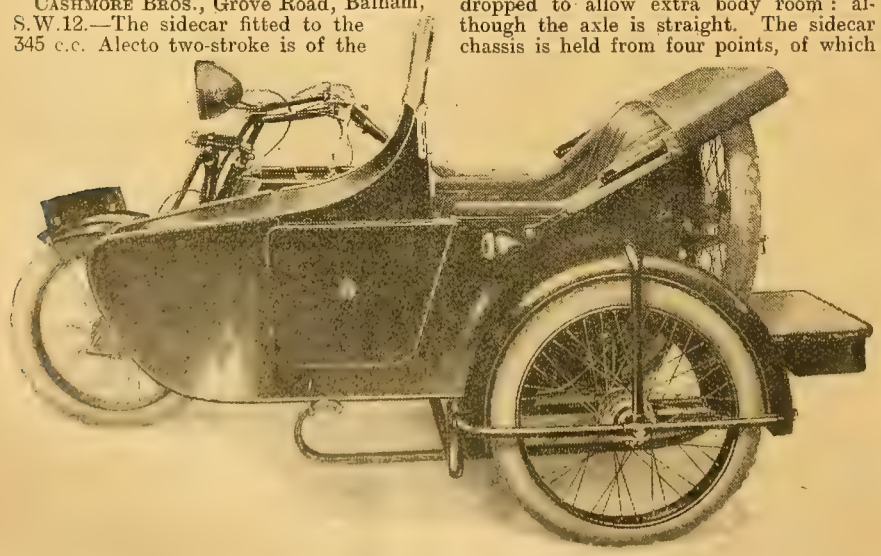
ARIEL.

Ariel Works, Ltd., Bournbrook, Birmingham.—As in several other well known machines the Ariel frame is dropped to allow extra body room: although the axle is straight. The sidecar chassis is held from four points, of which two are at the steering head. Extra care has been taken to provide those luxuries which add so enormously not only to the comfort, but also to the convenience of the sidecar as a vehicle, and the rear locker is large enough to take a good-sized suit case; the mudguard is of the car type and fixed to the body; the springing is soft and luxurious; and a large and well placed step is provided; there are also map pockets arranged in the upholstery on each side of the body, and other little conveniences.

ARMIS.

Armis Cycle Co., 290-291, Heneage Street, Birmingham.—Surprising roominess with light weight is the most prominent characteristic of the lightweight sidecar fitted to the Armis-Precision 350 c.c. two-stroke. Although the lightweight outfit has undoubtedly come to stay, it cannot be denied that in certain cases the body used is hardly adequate for a full-sized passenger; however, this certainly does not apply to this model. Another point is that the back squab of the seat is high enough to give proper support to the back—a matter of more importance than is usually realised. C springing is used, and the connections are of the three-point variety.

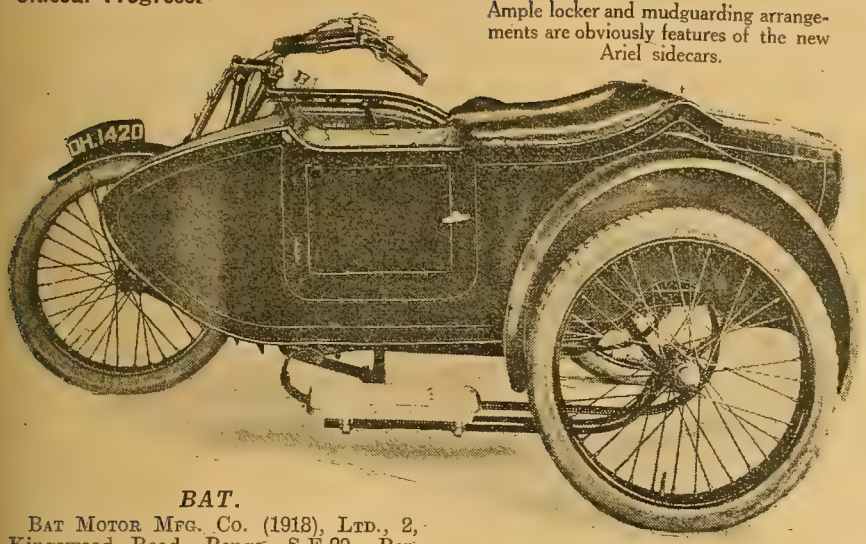
In the heavier model, which is fitted to a 5-6 h.p. J.A.P.-engined machine, four-point suspension is used, the fourth support being taken from a point about halfway down the saddle tube. The body is supported by long links from the C springs, which insulate it from shocks, and is of the normal mediumweight type, most excellently upholstered and very roomy.



Complete with spare wheel, grid, screen, and hood, the A.J.S. was one of the most attractive sidecars at Olympia

A cutter type sidecarette—the Alldays Allon

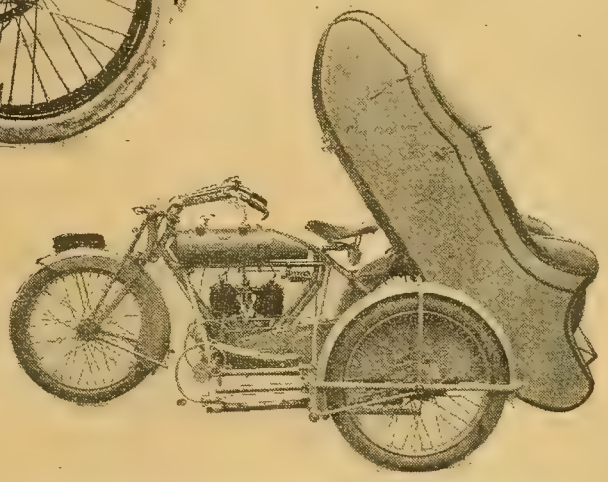
Sidecar Progress.—



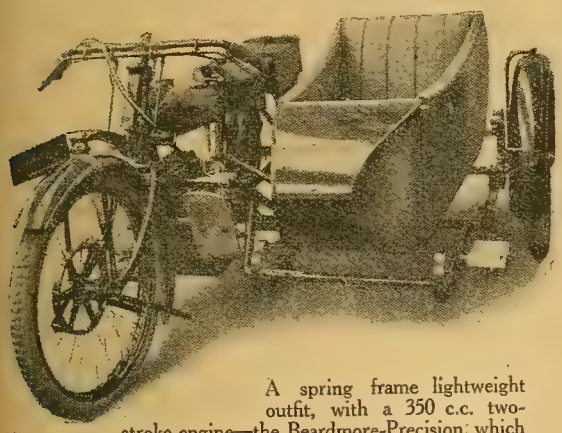
Ample locker and mudguarding arrangements are obviously features of the new Ariel sidecars.

BAT.

BAT MOTOR MFG. CO. (1918), LTD., 2, Kingswood Road, Penge, S.E.20.—Perhaps the best sprung sidecar in the Show is that fitted to the 8 h.p. Bat machines.



Showing how the body may be swung out of the way when adjustments are necessary on the Bat motor cycle.



A spring frame lightweight outfit, with a 350 c.c. two-stroke engine—the Beardmore-Precision, which has a sprung sidecar axle.

The front of the body is slung on C springs of the usual type, but the rear is supported on two independent quarter-elliptic springs of great length, and the clearances are designed so as to allow for a spring deflection of six or seven inches. Not content with this, the makers use a spring-supported sidecar wheel. The wheel spindle (it is not a stub axle) is suspended in forks which pivot freely about their connection to the sidecar chassis, and are held by two large helical springs. The result of this system is that one sinks into the sidecar seat as one does into a well-built armchair.

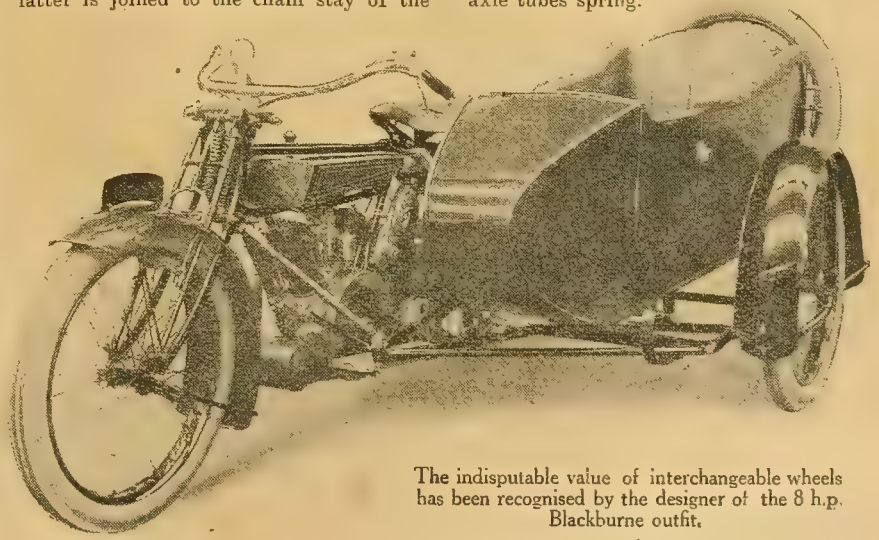
Provision is made for carrying a spare wheel on the right-hand side of the body, and in both the two models shown there is accommodation for a large amount of luggage, either on a car type luggage grid at the rear or in an extra large boot.

BEARDMORE-PRECISION.

F. E. BAKER, LTD., King's Norton, Birmingham.—In designing a lightweight sidecar to be attached to the Beardmore-Precision spring frame two-stroke machine, several interesting problems had to be surmounted. It was essential that the advantage of the sprung motor cycle frame should not be lost, and at the same time it was necessary to keep down the weight to a minimum. The main frame of the chassis is rectangular, and of quite short length, and is not rigidly connected to the rear axle. This latter is joined to the chain stay of the cycle by a short but flexible leaf spring, and the rear of the body is suspended from this sprung axle. There is no direct connection from the front of the chassis to the head of the motor cycle, but a diagonal stay from the junction of saddle tube support and the chassis is carried up to the head, and joined about two-thirds along its length by the front chassis support. The body, while following standard practice, is larger and more comfortable than the majority of those fitted to lightweight chassis.

BLACKBURNE.

BURNEY AND BLACKBURNE, LTD., 28, Conduit Street, W.1.—As an example of robust construction, the U.A.C. sidecar fitted to the 8 h.p. Blackburne is fully worthy of the machine to which it is attached. All the tubes by which it is fixed to the motor cycle are attached to a long triangulated girder member which forms the backbone of the chassis construction. The hinder end of this member is made up of two open steel pressings, from which the two axle tubes spring.



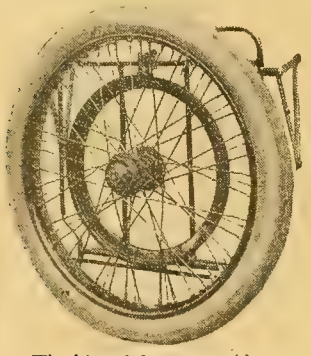
The indisputable value of interchangeable wheels has been recognised by the designer of the 8 h.p. Blackburne outfit.

Sidecar Progress.—

The sidecar wheel is supported from both sides by two loop tubes, which also form two extremely rigid mudguard supports integral with the chassis. The body itself is roomy and is provided with a fair sized boot for luggage: the spare wheel is supported under a grid, which allows of additional luggage accommodation. The body is supported on C springs and an increasced clearance has been provided.

B.S.A.

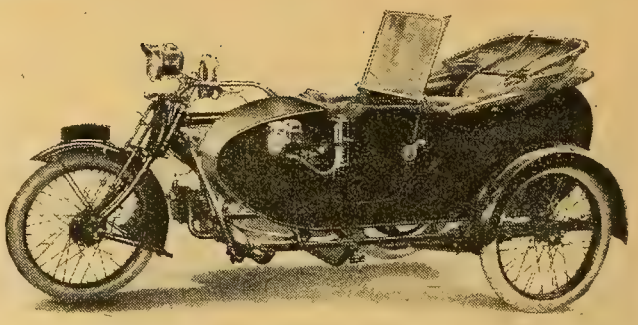
B.S.A. CYCLES, LTD., Small Heath, Birmingham.—A new design of sidecar fitted to the 4¼ h.p. B.S.A. has a most interesting type of chassis, in which weight and complication are reduced to a minimum. The main frame consists of an open triangle, of which the rear member is a double tube. At the front the two points of attachment on the machine are connected by tubes to the apex of a triangle, so that only six tubes in all are used for the chassis, including the stay from the saddle.



The hinged luggage grid on the B.S.A. sidecar provides a safe and unobtrusive anchorage for the spare wheel.

The body is suspended at the rear on a single transverse inverted semi-elliptic spring, and it is noteworthy that this spring, following the latest car practice, has been enclosed in a gaiter. In front the body is supported at a single point by a coil spring, thus giving the coachwork a true three-point suspension, while the mudguard is fixed on the body and not to the wheel axle.

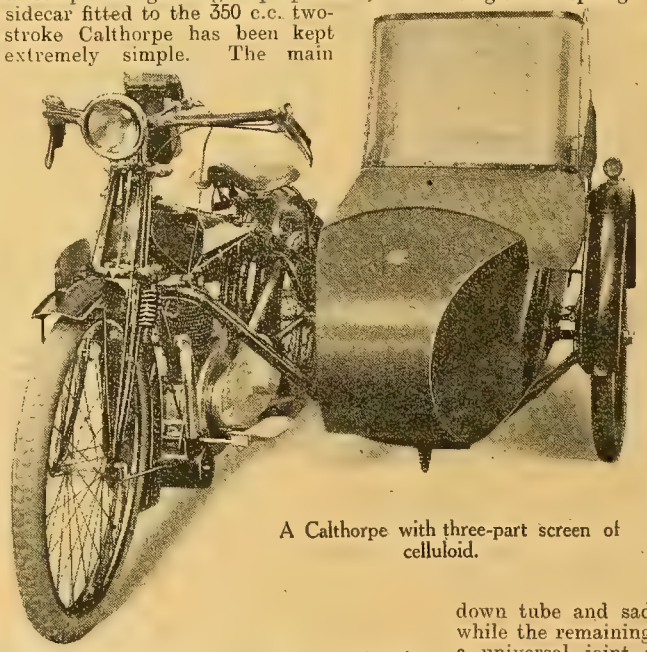
On the twin B.S.A. the sidecar is of a more conventional type, with a frame all round the wheel instead of a stub axle, and a spare wheel attached to the luggage grid.



On the Brough the lamp and generator for the sidecar is fitted to the body.

CALTHORPE.

CALTHORPE MOTOR CYCLE CO., Barn Street, Birmingham.—Being designed as a complete lightweight proposition, the sidecar fitted to the 350 c.c. two-stroke Calthorpe has been kept extremely simple. The main frame of the chassis is simply a triangle with rounded front end. Four attachment tubes are carried to the usual points on the motor cycle frame. It is noteworthy that suspension by cantilever springs has been adopted at the rear, while the front of the body is held on a single coil spring at the apex, thus providing a three-point suspension.

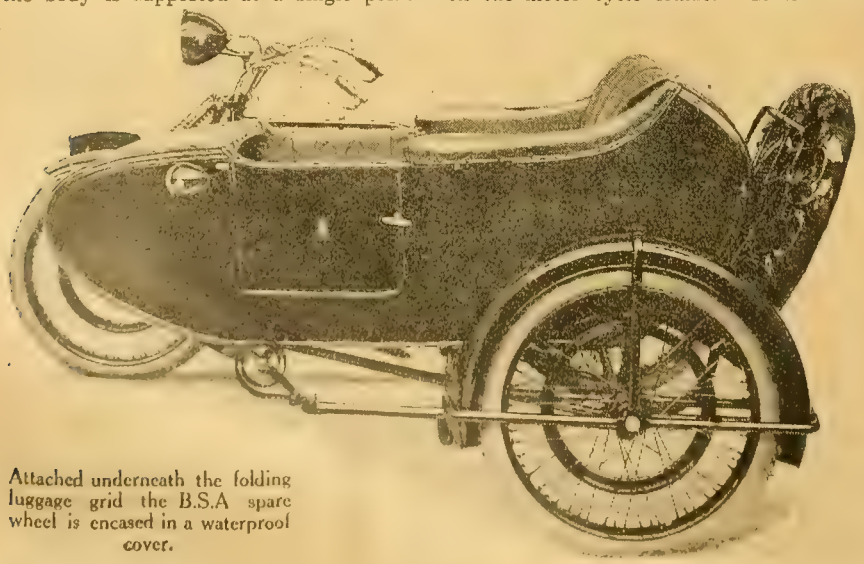


A Calthorpe with three-part screen of celluloid.

A large locker and a long and comfortable seat of extra width are points which it is unusual to find in a sidecar of such extremely light weight.

CAMPION.

CAMPION CYCLE CO., LTD., Robin Hood Street, Nottingham.—With this firm rests the honour of producing the first sidecar taxicab outfit to be licensed to ply for public hire. The chassis, which is attached to an 8 h.p. Campion machine, is of the underslung variety on straightforward lines. Five attachments are used, two each to the front down tube and saddle tube respectively, while the remaining one is in the form of a universal joint attached to the chain stay near the fork end. The large double-seated cabriolet body is mounted upon a pressed steel sub-frame, which is insulated from the chassis by means of two underslung half-elliptic springs fixed at the front, pivoted at the axle, and shackled at the rear. Two upturned quarter-elliptics with scroll ends carry the front of the sub-frame. This method of carrying a large body is claimed to be ideal, since it eliminates most of the stresses from the bottom boards. A standard Campion single-seated touring sidecar is also made with an underslung chassis.

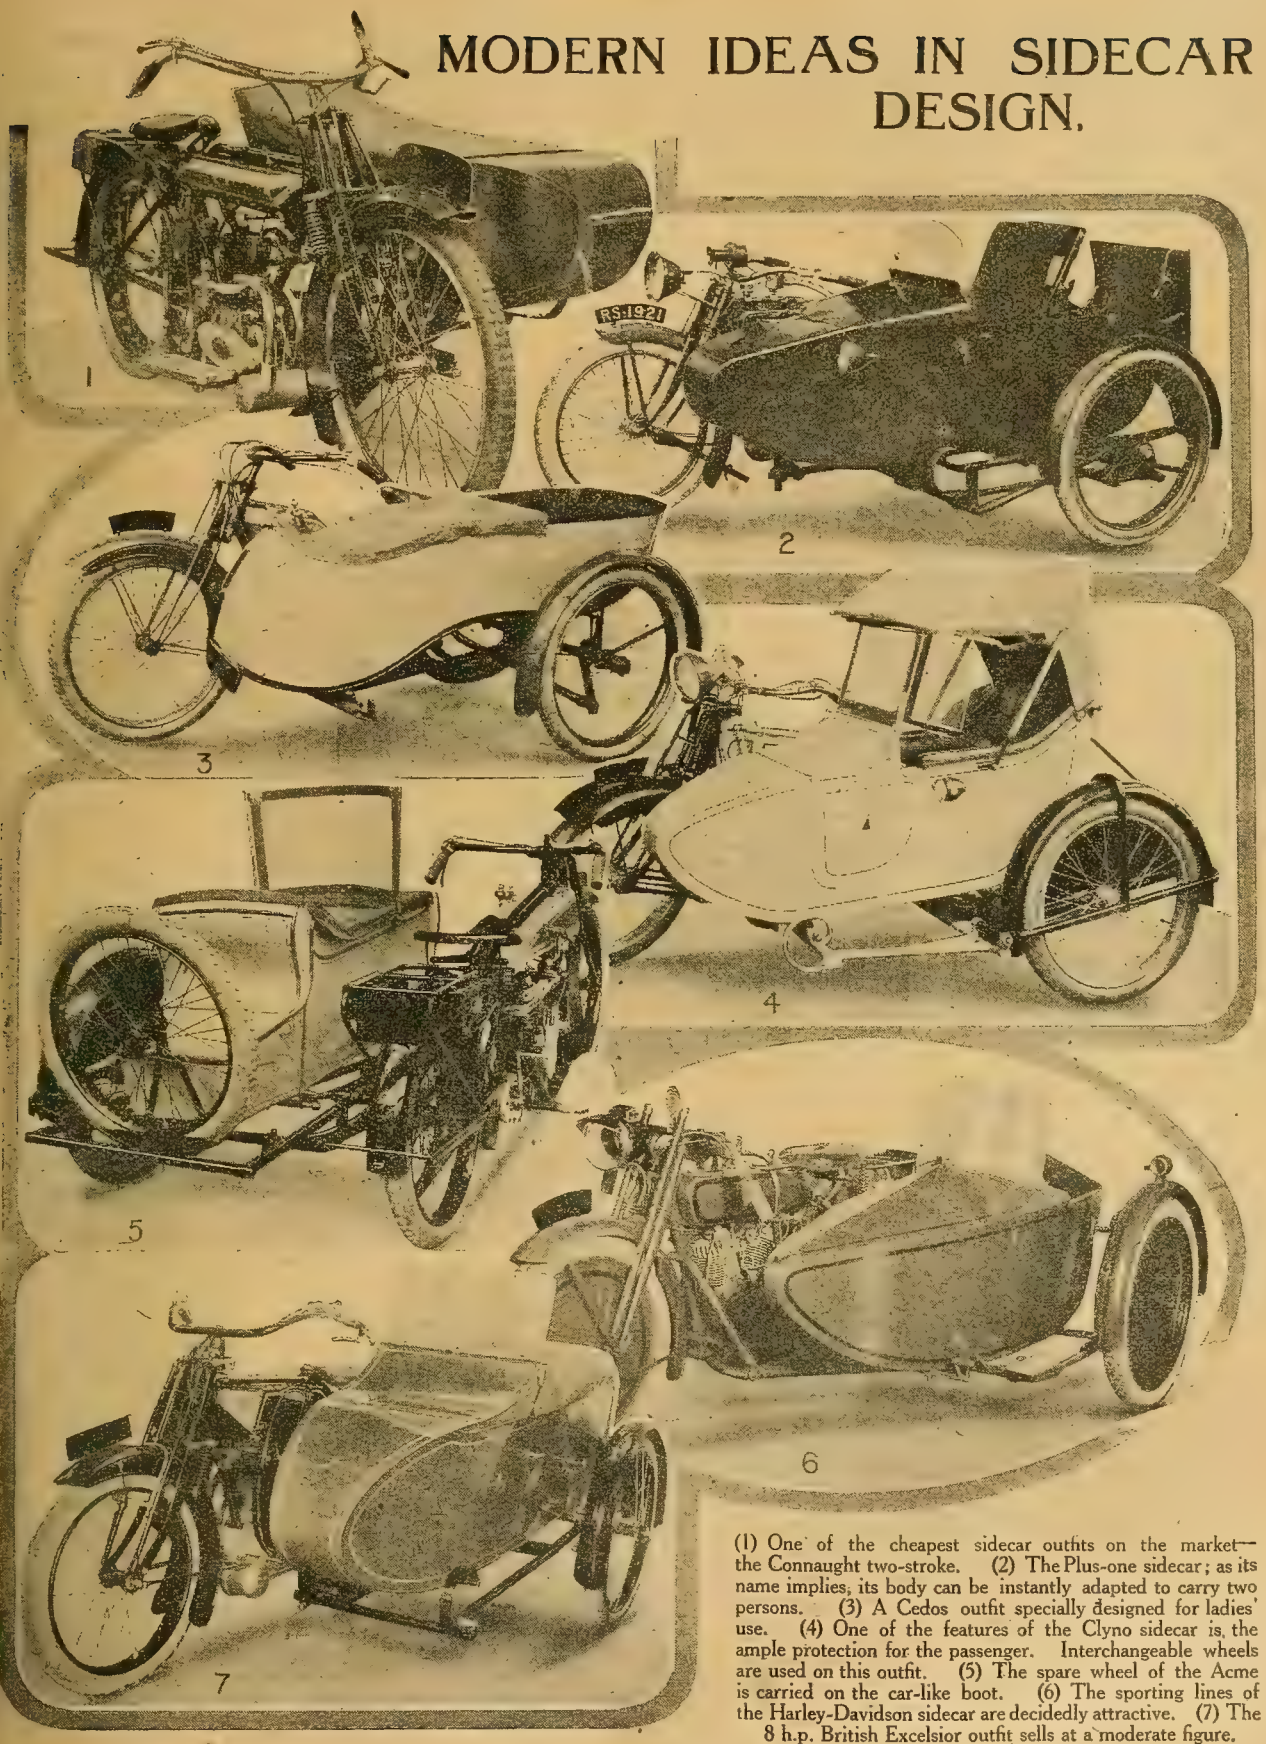


Attached underneath the folding luggage grid the B.S.A spare wheel is encased in a waterproof cover.

CANOELET.

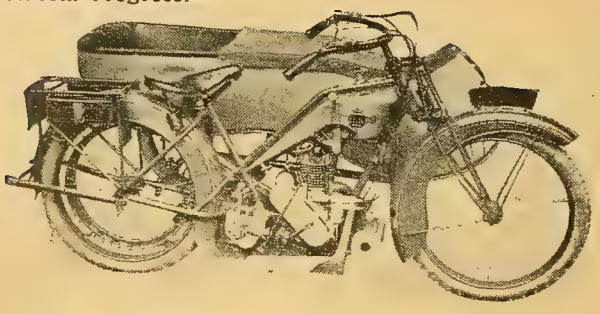
MEAD AND DEAKIN, Birmingham.—Probably the Canoelet models best known to the general public—by reason of their very distinctive lines—are the Minor and Sporting types, which have become justly famous for use in connection with light machines, or even with heavy mounts, where a light attachment of the racing type was required. An innovation just introduced is the model T4. The chassis of this has a very slightly dropped axle, and is simply constructed of three main tubes converging towards the front, where they run parallel for some few

MODERN IDEAS IN SIDECAR DESIGN.

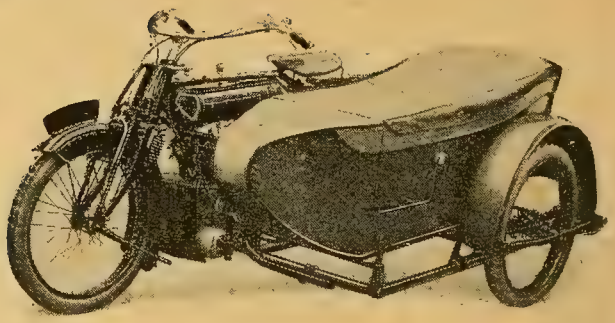


(1) One of the cheapest sidecar outfits on the market—the Connaught two-stroke. (2) The Plus-one sidecar; as its name implies, its body can be instantly adapted to carry two persons. (3) A Cedos outfit specially designed for ladies' use. (4) One of the features of the Clyno sidecar is the ample protection for the passenger. Interchangeable wheels are used on this outfit. (5) The spare wheel of the Acme is carried on the car-like boot. (6) The sporting lines of the Harley-Davidson sidecar are decidedly attractive. (7) The 8 h.p. British Excelsior outfit sells at a moderate figure.

Sidecar Progress.—



To the lady sidecarist this little Cedos lightweight outfit will make a special appeal.



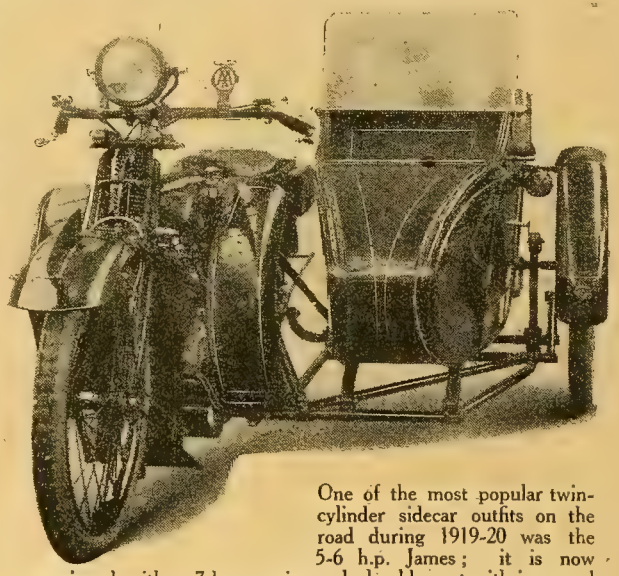
A Grindlay sidecar is used as standard on the 6 h.p. Bradbury

inches, forming a platform on which the front quarter-elliptic springs and the front attachments are clipped. The body, which is carried at the back on C springs, is of very graceful shape, and provides ample room for the passenger. A special feature is the celluloid windscreen, which is curved to follow the circular opening of the dash. The near side end of the screen is carried on a swivelling vertical rod attached to the door, so that the screen opens with the latter, and is thus out of the way when the passenger is entering, or alighting from, the car. Four-point attachments are used; the mudguard is carried on the side of the body, and a large bulbous locker is provided.

The other touring Canoelet sidecars remain as they were, no alterations being found necessary. It should be borne in mind that this firm probably did more to popularise the coachbuilt sidecar than any other in the earlier days of motor cycling. The Canoelet taxicab is a new departure, which will be dealt with in the near future.

CHATER-LEA.

Chater-Lea, Ltd., 74, Banner Street, London, E.C.1. — In chassis design, the Chater-Lea sidecar (as fitted to their 8 h.p. machine) follows the generally accepted practice for heavy sidecars of using triangulated longitudinal members. They offer, however, a two-seater body of considerable interest. In this, both the seats, which are arranged in tandem, are of full size and suitable for adults. In order to afford extra leg room in the front seat, there is a well in the extreme toe of the chassis which can be dropped, or if desired can be clipped up flush with the remainder of the body. If it is not desired to carry two persons the back of the rear seat can be folded forward, and the back and seat of the front seat can be shifted to an alternative position further back, giving an extremely large, roomy, and luxurious body for one. The spare wheel is carried on the front of the body.



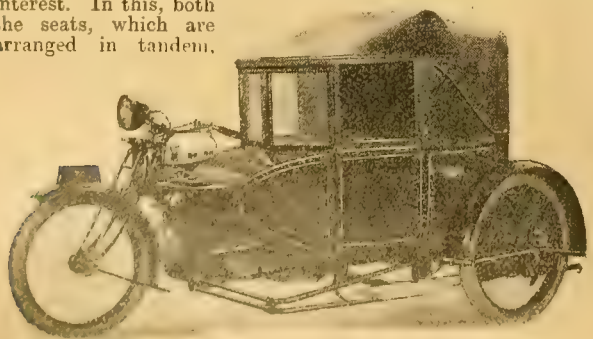
One of the most popular twin-cylinder sidecar outfits on the road during 1919-20 was the 5-6 h.p. James; it is now equipped with a 7 h.p. engine and should meet with increased success.

CLYNO.

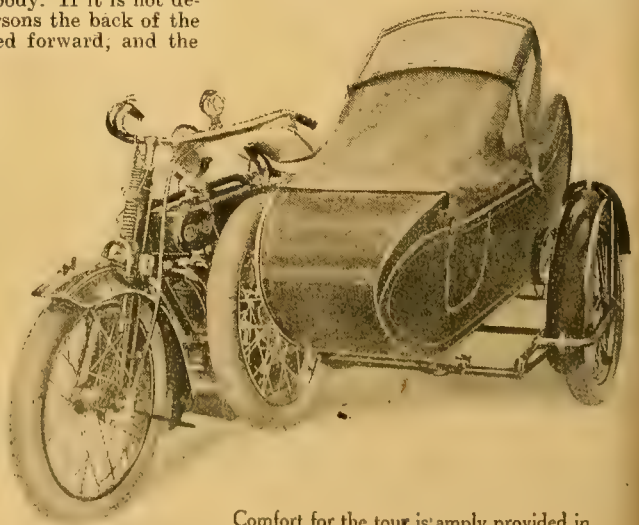
Clyno Engineering Co., Ltd., Pelham Street, Wolverhampton. —As usual with sidecars for sprung frames, the Clyno chassis is cut off short at its rear end, the hindermost attachment being a double connection running to the saddle pin and to a point near the bottom of the saddle-pillar. The upper of these two tubes is carried right across to form a triangular rear cross member, on the outside end of which is the spring box, which holds the outer body C spring, and also the leaf spring, which insulates the chassis from the wheel.

The forward end of the chassis is attached to the front down tube of the cycle, and another connection goes right to the top frame tube. The design of the spring wheel is particularly good, as also is the construction throughout.

The glass windscreen with celluloid side lights, the excellent hood, and the luggage carrier faced with aluminium matting, combine to give great luxury.

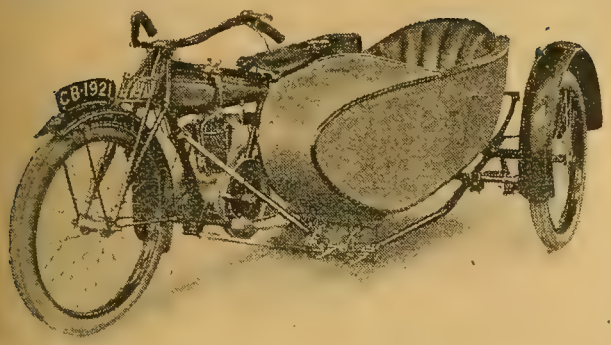


A taxi-sidecar which does not look cumbersome—the handsome Campion vehicle with taximeter mechanism on the front of the body.



Comfort for the tour is amply provided in the 8 h.p. Chater-Lea outfit.

Sidecar Progress.—



The Coulson sidecar has a spring wheel utilising quarter-elliptic springs, as on the machine itself.

COPPEN ALLAN.

COPPEN ALLAN AND CO., 89, Great Portland Street, W.1.—Remarkable ingenuity is shown in the design of the Plus One sidecar. While the chassis is of more or less normal design, the body is very novel. When in use in the ordinary way, the passenger sits in what is practically an extra luxurious deck chair, with a padded front edge to the seat and an elastic back, the whole being adjustable. If no passenger be carried the seat may be swung down into the body, and the whole protected by the apron. When accommodation for two is required the dickey seat is opened, and this gives ample room for a full-sized passenger.

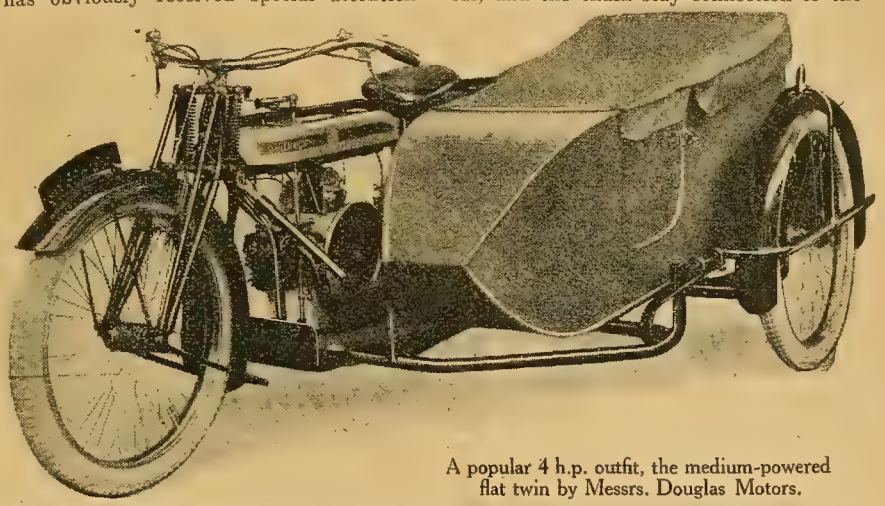
For the carrying of luggage or parcels alone, both seats may be removed completely, thus giving the luggage capacity of a trades' delivery car. The sidecar as sold is complete with apron, lamp bracket, and aluminium step, and altogether seems to represent a real advance in design.

COULSON-B.

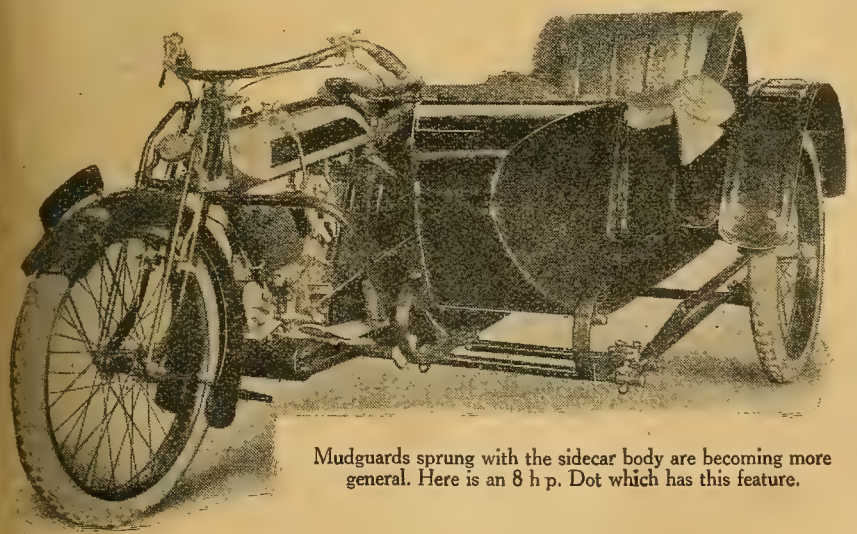
F. ASLETT COULSON ENG. CO., Albion Street, London, N.1. — Spring frame machines, such as the Coulson-B, necessarily demand that sidecars attached to them shall also have spring wheels if the overall comfort of the outfit is to be assured. In this respect the Coulson sidecar has been very effectively designed with a form of spring axle support very similar to that employed on the motor cycle rear wheel. All the five connections are made to rigid parts of the frame, and the body is carried on quarter-elliptic springs at the rear and a central C spring in front, the latter being secured to the apex formed by the converging tubes of the chassis. Rearwardly, these tubes are extended so that they may be used as a luggage grid. A very attractive body is used, having a pointed tail, in which is a convenient locker covered with a lid held by a spring catch.

DALTON.

DALTON MOTOR CO., LTD., 17, John Dalton Street, Manchester. — Springing has obviously received special attention in the sidecar fitted to the 5-7 h.p. flat twin Dalton. The main frame of the chassis is roughly triangular in plan, but has two cross members at the rear. These cross members support the two ends of a pair of inverted semi-elliptic springs of car type, spiral spring shock absorbers intervening between the two. The centre trunnions of these semi-elliptic springs support the sidecar body. The result is an extremely flexible suspension, resembling that of an expensive car. The stress is distributed from the chain stay support and the sidecar wheel stub axle by a pair of very solid steel stampings, which spread the load. Another good point is that the chain stay tube has a universally jointed attachment, which is only locked up when the sidecar is actually aligned. The sidecar body is long and very roomy, having a large locker at the back and ample leg room in front.



A popular 4 h.p. outfit, the medium-powered flat twin by Messrs. Douglas Motors.



Mudguards sprung with the sidecar body are becoming more general. Here is an 8 h.p. Dot which has this feature.

DOT.

DOT MOTORS, Ellesmere Street, Hulme, Manchester.—On the 8 h.p. Dot-Jap, the sidecar has a new type of chassis of considerable interest, mainly for the fact that it is designed to be readily fitted either on the right or left of the machine. For this purpose, the main rectangular frame of the chassis is entirely symmetrical, and the chain stay connection to the cycle frame can be interchanged with the stub axle carrying the sidecar wheel. The front cross member of this frame is not brazed to the remainder, but clipped in lugs, and the two attachment tubes can be fitted to either end of it. Similarly, the saddle pin connection can be affixed at its lower end to either side of the sidecar chassis.

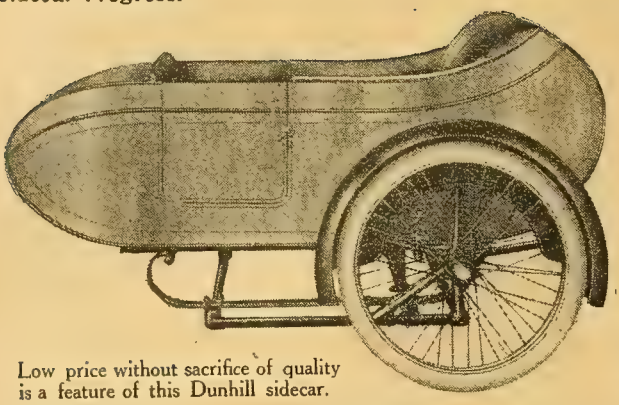
In addition to the convenience of being able to use the sidecar, either as right or left-hand, the sliding front tube makes it exceedingly easy to obtain correct alignment. The mudguard over the sidecar wheel is very wide—in fact it is of car shape, and is suspended from the body instead of the axle, which is by far the most satisfactory arrangement.

The body, while not showing any deviation from standard practice, is well designed for comfort, and is most luxuriously upholstered.

DOUGLAS.

DOUGLAS MOTORS, LTD., Kingswood, Bristol.—Very few changes have been made in the chassis of the Douglas sidecar: it remains as it was—a fine example of robust yet light construction. Its main point of divergence from the usual is in the square girder-built

Sidecar Progress.—



Low price without sacrifice of quality is a feature of this Dunhill sidecar.

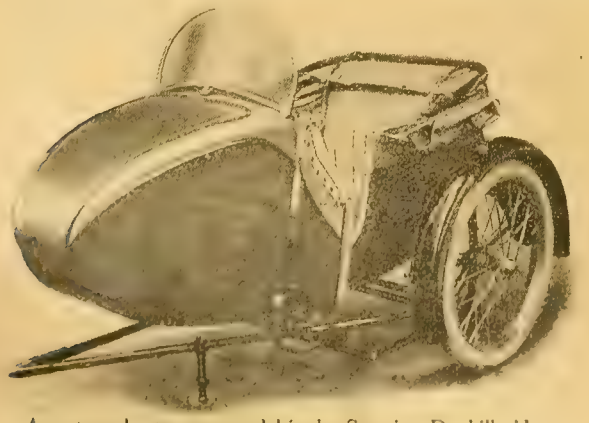
longitudinal member on the cycle side of the chassis. This has a triangulated attachment to the chain stay, and also two tubes running to the head and the saddle-pillar. The fourth attachment (to the footrest) is by a tube which forms the front cross member of the frame. Both this and the rear cross member are dropped to allow body room, and the body itself is suspended on the rear member by a transverse semi-elliptic spring. The frame extends all round the sidecar wheel, which is on an ordinary spindle instead of a stub axle; the surrounding frame also gives a very rigid support to the mudguard.

DUNELT.

Dunford and Elliott (Sheffield), Ltd., 95-99, Bath Street, Birmingham.—For this machine (the 500 c.c. two-stroke, which we have already described in these columns) the Watsonian Company has built a specially designed sidecar. This is chiefly notable for the very low dropped frame, which allows room for an exceptionally deep and roomy body. This frame is carried right round the sidecar wheel, for which it forms the spindle support (the sidecar wheel is interchangeable with the others). Three bent members which cross round the wheel also support the mudguard, giving great rigidity.

The body is sprung on C springs at the rear and coil springs in front. Behind the seat is fitted a large luggage locker and the spare wheel.

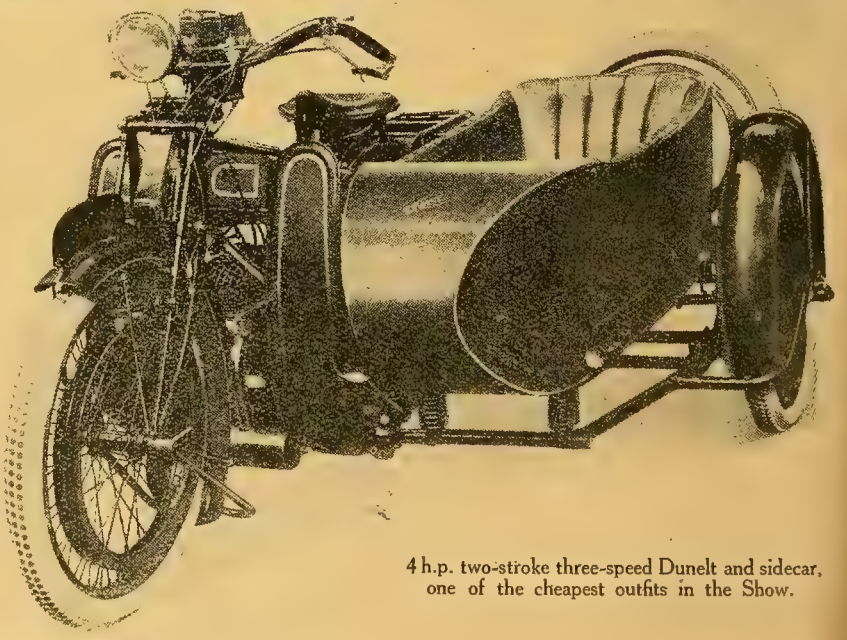
Convenient map or glove pockets are fitted in the sides of the body.



An extremely attractive model is the Sporting Dunhill sidecar. Observe the triangulated front members of the chassis.

DUNHILL.

Dunhills, Ltd., 359-361, Euston Road, N.W.—In the type of chassis which follows in plan view the lines of a right-angle triangle, the above firm may be regarded as pioneers, since they have made this method of construction their own. It is used with various modifications in the majority of their sidecars, and permits a strong structure to be made without sacrifice of lightness. They are varied by extra cross bracing members, but the general plan remains the same. Particularly luxurious bodywork is one of Dunhills specialities, and various types of body are shown, including a special two-seater model, which is convertible to a single-seater by a slight alteration, as required. The springing of all the bodies is on conventional lines by means of separate C springs at the front and rear. On the Limousette model a very neat V fronted celluloid windscreen is carried on a high hinged dash, while on another model a bevelled mirror is inserted beneath the dash. This is a point which should appeal particularly to lady passengers. A new model of the cabriolet type, known as the Jasmine, is also introduced. This is most luxuriously upholstered in Bedford cord and fitted with Triplex safety glass in all the panels. For those who require a sidecar of the family variety, a specially wide model, tapering to the front, is provided. This has slightly staggered seats which will accommodate an adult and child, sitting side by side. In preference to mounting a luggage grid on the back of the body, the firm evidently favour a separately sprung arrangement secured by means of long quarter-elliptic springs to the back of the chassis.



4 h.p. two-stroke three-speed Dunelt and sidecar, one of the cheapest outfits in the Show.

F.N.

F.N. (England), Ltd., Kimberley Road, Willesden Lane, N.W.6.—Bevel-driven machines do not lend themselves very easily to the attachment of an ordinary sidecar, but the special chassis designed by F.N. gets over all difficulties. The backbone of the frame is a long double member attached to the chain stay just clear of the bevel casing. It also has a triangulated tube fixed to the saddle-pillar, and the two members joined at the front just before reaching the steering head. From this girder construction is built out the rectangular frame which supports the body, and also passes round the wheel to support the latter on both sides.

The body is chiefly notable for the great depth of the back of the seat, which affords the rider most excellent protection in conjunction with the solid windscreen and Cape hood which are fitted.

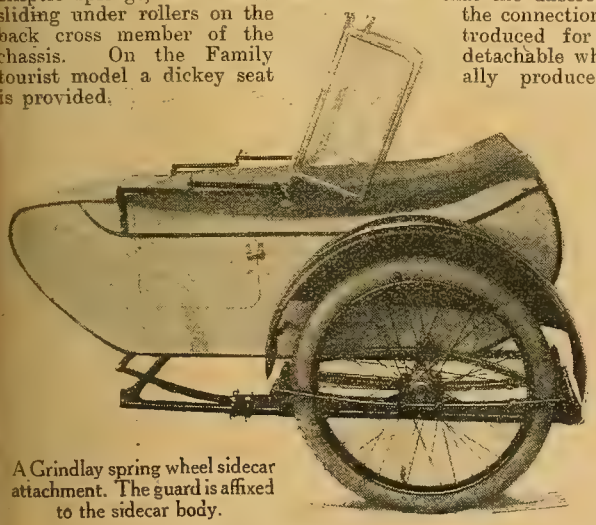
GRINDLAY.

Grindlay (Coventry), Ltd., Melbourne Works, Coventry.—A slight improvement has been effected in the suspension of the body on the well-known Grindlay spring wheel chassis; this lies in the substitution of quarter-elliptic springs for the coil springs which formerly supported the front portion. The main part of the spring wheel system, however, remains unaltered, since it has been found to be perfectly satisfactory in practice. The mudguards also, which are attached to the bodies, are now of domed section in place of the flat wings

Sidecar Progress.—

The spare tin of petrol almost holds itself on the sloping tail of the Club model Grindlay sidecar.

which have hitherto been used. Various styles of coachwork are obtainable, and adequate provision is made for luggage carrying on the touring bodies. A new sporting type, known as the Club, is now introduced, and, having no door, access to the interior is facilitated by means of a cast aluminium step bolted to the side of the body. A neat curved celluloid windscreen is secured in front of the seat, which is very low and allows a comfortable reclining position for the passenger. In addition to the spring wheel models, there are also two types mounted upon fixed wheel chassis. One of these is the Popular, which is suitable for general touring work when attached to machines of medium power; while the sporting type is of particularly light construction, and follows the general lines of similar attachments, the seat being of the hammock variety. The body springing of this particular model is especially interesting; the front is supported on two upturned quarter-elliptics, while the rear is also carried on two other quarter-elliptic springs, the free ends of these sliding under rollers on the back cross member of the chassis. On the Family tourist model a dickey seat is provided.



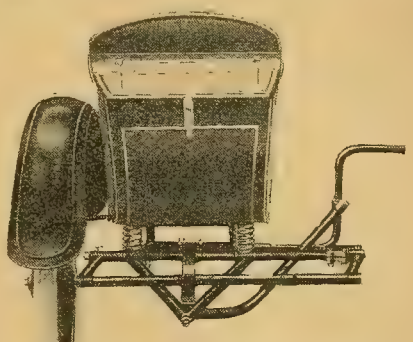
A Grindlay spring wheel sidecar attachment. The guard is affixed to the sidecar body.

HARLEY-DAVIDSON.

Harley-Davidson Motor Co., Ltd., 74, Newman Street, London, W.1.—The great power of the Harley-Davidson big twin lends itself naturally to the fitting of luxurious sidecars, and full advantage has been taken of this fact by the makers. In fact, their standard sidecar body would be listed by many makers as a *de luxe* type. The chassis is interesting, being of a fully triangulated girder type. It is supported not only by the chain stays themselves, but also by the back stays, thus getting double strength at this important point; and it is noteworthy that, instead of being built up on brazed lugs, the joints between the tubes are all acetylene welded. The chassis is lined up with great care at the works, and no adjustment is provided for this, as it is considered that the work cannot be done sufficiently accurately without the makers' special facilities. The body has an integral windscreen and hood, map lockers in the doors, a glove locker in the scuttle, and two large cupboards behind the seat. For sporting purposes a much lighter sidecar of the canoe type is shown, which shows the same interesting points in design as the heavier type. There is also a trade delivery sidecar of extremely high cubic capacity, on a chassis of slightly different design.

HENDERSON.

Henderson Sidecars, Aero Works, Fitzwilliam Street, Sheffield.—The designer of the Henderson sidecars has made very serious efforts to eliminate all doubtful materials or methods of construction from his productions, and the tubes and other metal parts used in the chassis are all selected with regard to their suitability for the particular part in which they are used. Thus the connections from the chassis to the frame of the machine are of a special kind of steel tubing, which has a higher elastic limit than the tubing used in the chassis itself, while the axles and connections are of high tensile steel, which is heat-treated. Any bolts which would be liable to rust into the connections in which they are used are made of rustless steel. The actual frame connections are of the taper socket variety, and are provided with a special form of self-withdrawing joint, so that the unscrewing of the nut separates the connection itself. A new model introduced for 1921 is the Elite with detachable wheel. This has been specially produced in order to suit the various high-powered machines now on the market, which are fitted with detachable and interchangeable wheels, and it is sold without a wheel, so that it can be arranged to take any maker's standard wheel. Provision for carrying the spare wheel is made at the back. The springing system of this sidecar is particularly good, consisting, as it does, of a combination of semi-elliptic laminated springs working in conjunction with coil spring shock absorbers. The semi-elliptic springs are pivoted at their centres, the rearmost ends carrying the bearer bar for the body, while the forward ends are anchored to the chassis by the coil tension-spring adjustable shock absorbers. Special features of these sidecars are the ample luggage-carrying capacity and the flat lid to the locker, which forms an additional platform on which petrol cans or suitcases may be carried. For very light machines there is a special Featherweight model, which weighs but 65 lb. complete, while there is also a spring wheel sidecar, which has a wonderfully efficient system of insulation, by means of a single laminated C spring, the only unsprung weight being the wheel and the floating axle. In this case, the front of the body is carried on C springs, while the rear is supported on two large diameter coil springs in compression. In all cases, the mudguards on the Henderson sidecars are securely attached to the body, a method long standardised by this firm.



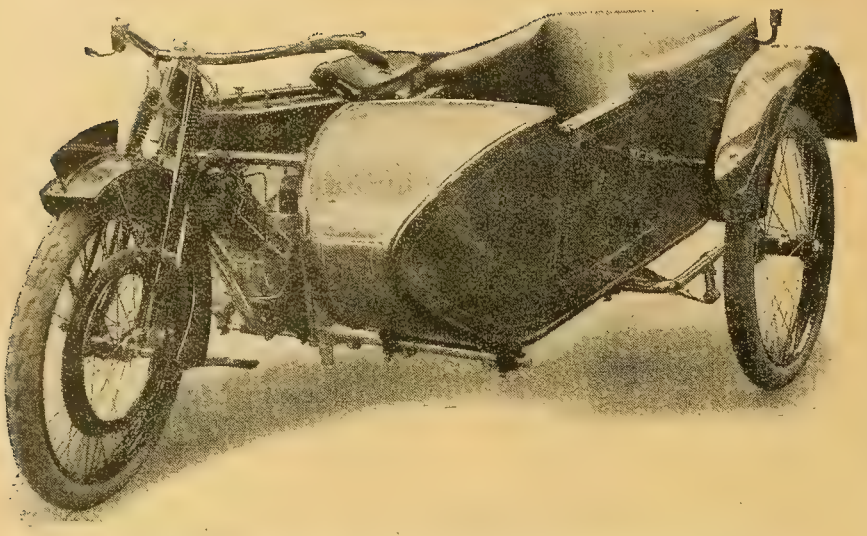
Simple and adjustable suspension is provided on the Sheffield Henderson spring-wheel model.

INDIAN.

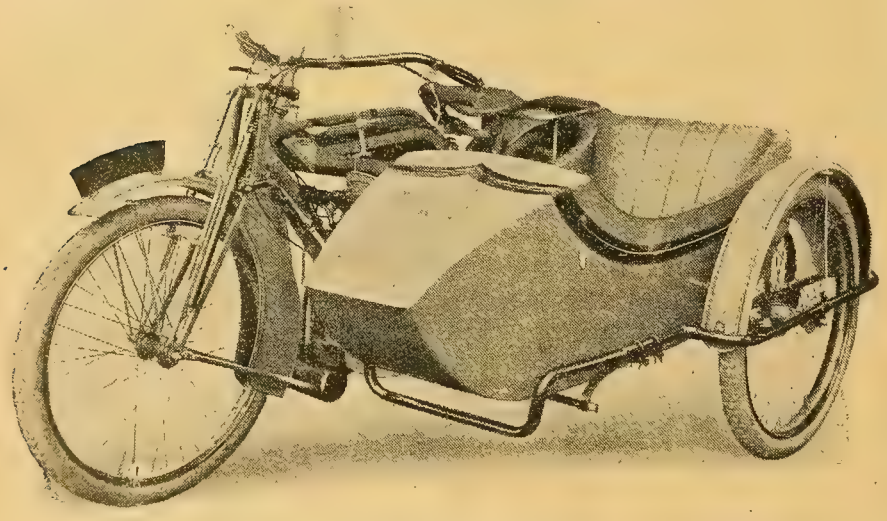
Hendee Manufacturing Co., 366, Euston Road, N.W.1.—Sidecars for use with the Indian machines must, of course, be specially designed to be capable of attachment to the spring frame which is used on this machine. With the object in view, the main frame of the sidecar is kept very short from front to rear, and the hindermost attachments take the form of two struts which are fixed respectively just behind the saddle pin and just above the gear box. Since there is such ample power available, the sidecar is of extraordinarily robust construction, and the body is large and luxurious, with ample lockers for carrying a considerable amount of personal luggage.

IVY.

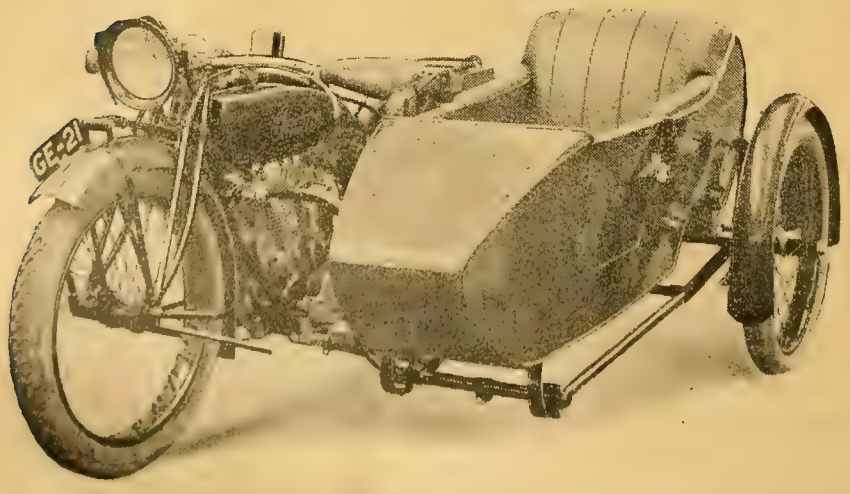
S. A. Newman, Ltd., Lichfield Road, Birmingham.—After the recent performance of an Ivy in climbing the Wyche cutting (1 in 2.9) fifteen consecutive times with a passenger, and several times with two passengers, one expected to find that the sidecar used was of the featherweight type; but this is far from being the case, for although the chassis is very light it is exceptionally solid in its design and construction. For one thing, the chassis takes the form of a rectangle completely enclosing the body. For another, the suspension is of the four-point type; and for a third the wheel is mounted in an all-round fork and not on



This Millford Rock "chassisless" sidecar attached to a P. and M. has many special points of interest in its design.



The graceful little sidecar attached to the Ivy two-stroke helps to render this lightweight outfit a very attractive proposition.



Roomy sidecars of practical design are attached to the Indian machines.

a stub axle; in fact, the general design of the sidecar is of the type usually associated with heavyweight outfits. Although the body is not bulky, yet room has been found to provide for a large locker for luggage.

IXION.

Ixion Motor Mfg. Co., Ladywood, Birmingham. — Experience gained in pioneering the miniature sidecar outfit is reflected in the light chassis attached to the Ixion 2½ h.p. two-stroke. Lightness is not only retained by simple design, but strength is in no way sacrificed. The chief feature is that the front attachment tube has its origin at the rear axle and runs parallel with the cycle frame, rising slightly, until it curves to the connection on the front down tube. For its small size the body is convenient, and the grey finish to match the machine is excellent.

MATCHLESS.

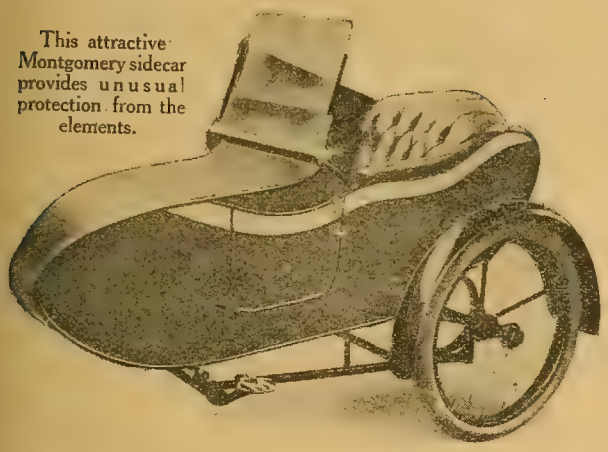
H. Collier and Sons, Ltd., 44, Plumstead Road, Plumstead, S.E.18.—In designing a sidecar for the Matchless machine, the makers were confronted with the necessity of specially arranging the rear springing to get the fullest advantage from the sprung rear wheel of the motor cycle. They have successfully done this by arranging an axle which carries the sidecar wheel, and is attached at two points to the unsprung portion of the motor cycle rear wheel fork. The rear suspension for the chassis itself is through helical springs from the sidecar wheel end of this unsprung axle and from the sprung part of the motor cycle frame. Here also the sidecar is attached to the cycle at two points. As there is also a two-point suspension at the front of the chassis, the total connections are no fewer than six, giving enormous strength. In addition to the rear coil springing, the front of the sidecar body is sprung on quarter-elliptic springs. There is a large boot, also a luggage grid on which the spare wheel is suspended. A windscreen is a standard part of the sidecar.

MILLFORD.

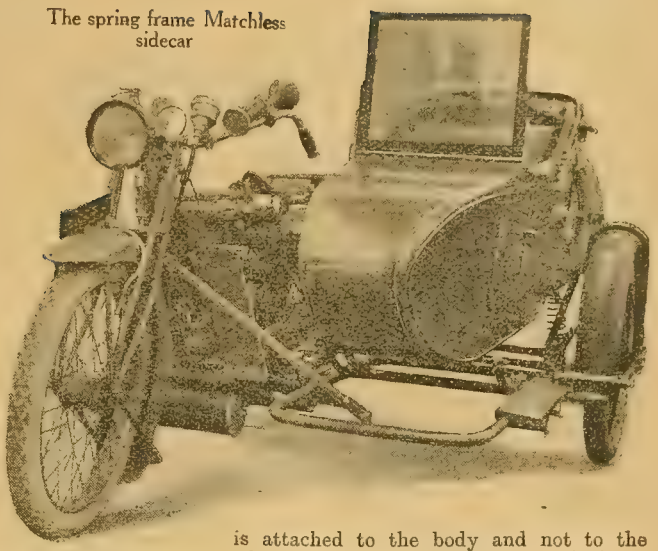
Mills-Fulford, Ltd., Crown Works, Coventry.—In view of the fact that the members of this firm may be counted amongst the pioneers of sidecar manufacture, it is significant to observe that they are now departing from all hitherto accepted principles of chassis construction. This refers, of course, to the Millford-Rock chassisless sidecar, which was one of the attractions of the Show. Briefly, the method of construction of this sidecar is as follows: a double cranked axle is secured to the back fork of the motor cycle by a spring joint, allowing a certain amount of flexibility in all directions. The forward part of the crank swings in bearings attached to the specially strong floorboards of the body, to which it is also adjustably attached through a single transverse half-elliptic spring and shackles. The fore part of the body is carried on a swivelling crossbar, capable of vertical movement and controlled by enclosed coil springs; it will, therefore, be seen that the only connection between the front and back attachment is the body itself. The flexibility of the sidecar is such that no direct shocks from the

Sidecar Progress.—

This attractive Montgomery sidecar provides unusual protection from the elements.



The spring frame Matchless sidecar



side wheel are transmitted to the frame of the motor cycle. Almost any type of body can be fitted to this chassis, provided that the bottom boards are of suitable strength. The standard Millford models remain unchanged, and the very simple chassis construction, which permits the use of a low body without the necessity of underslinging the axle, is retained. On the De Luxe sidecar, a heavy chassis with duplex side members and axle tubes (the latter being slightly underslung) is used. In addition to the normal single-seater bodies, there are two specially large ones; the Family, which is slightly longer than normal, with provision in the front part for a small additional seat, and the double-seater, which will accommodate two full grown passengers without overcrowding. The latter is specially suitable for high-powered machines. During the Show substantial reductions in price were made to all Millford models.

MONTGOMERY.

W. Montgomery and Co., Leicester Causeway, Coventry.—Montgomery sidecars reflect nineteen years' experience in sidecar construction, and great simplification of the chassis has been attained. In all patterns, whether light or heavy, the same type of framework is used, and the plan of the chassis takes the form of a truncated triangle. The axles are straight, thus avoiding weakness or the necessity of using exceptionally heavy fittings, as must be done when underslung construction is employed. The bodies, which vary from the light sporting type to the fully-equipped two-seater tandem, are specially well finished, and even in the lightest form the comfort of the passenger has not been neglected. Springing is by means of C springs at the rear and adjustable coil springs at the front. The sporting model will appeal particularly to those riders who prefer an outfit which generally follows graceful lines, and, if desired, as an extra, it may be fitted with a very handsome, curved celluloid windscreen, which affords very complete protection for the passenger—a point which is sometimes omitted on attachments of an ultra-sporting nature.

NEW IMPERIAL.

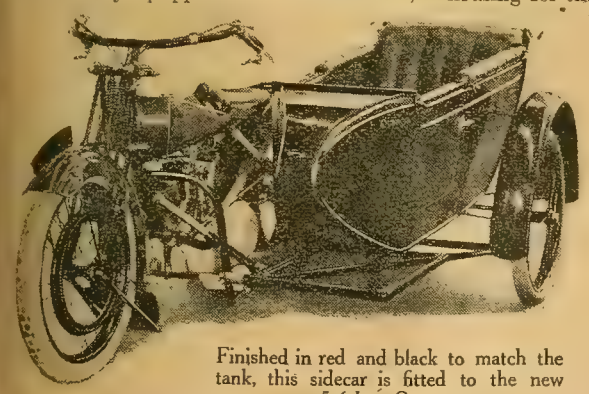
New Imperial Cycles, Ltd., Princip Street, Birmingham.—There are two neat points of constructional design on the New Imperial sidecar. The first of these is the rear axle, which is made of comparatively light tubing, but is provided with a king-post tension truss which relieves it of much of its load, thus getting great strength with a reduction in weight. There is also a heavy tie-tube between the chain stay attachment and the saddle pin. The body is sprung on C springs at the rear and quarter-elliptic leaf springs in front, and clearances are allowed for a large deflection, thus making the body most comfortable on the bad roads of the present day. It is interesting to note that the makers are following a practice now being extensively adopted, and are using steel pressings to form the chain stay connections and also the housing for the stub axle. The mudguard is attached to the body and not to the wheel, and is therefore relieved of vibrational stresses.

NORTON.

Norton Motors, Ltd., Bracebridge Street, Birmingham.—All the Norton sidecars, including the sporting or racing type, are mounted on similar chassis. This chassis has a trapezoidal rear portion, to which the chain stay and saddle tubes are attached, and a triangular front, which takes the two front fixings. A windscreen is fitted as standard to the body, which latter also carries the mudguard. Two types are shown, in one of which there is a large rear luggage compartment, while the rear portion of the other opens to form a small dickey seat suitable for a child. The racing model has, of course, no luggage accommodation, and is cut down to the minimum weight and head resistance, so as to cause a minimum loss of speed.

P. and M.

Phelon and Moore, Ltd., 4, Berners Street, W.1.—During the war about one-half of the P. and M. machines supplied to the R.F.C. were fitted with sidecars, and the experience gained has been very useful in making possible a reduction of weight without loss of strength. The chassis of the sidecar at present fitted is suspended from four points, having a double support from the steering head. The rear axle has a deep truss, to which the saddle support is taken. The body is supported on C springs, which are very flexible and easy, and good clearance is



Finished in red and black to match the tank, this sidecar is fitted to the new 5-6 h.p. Omega.

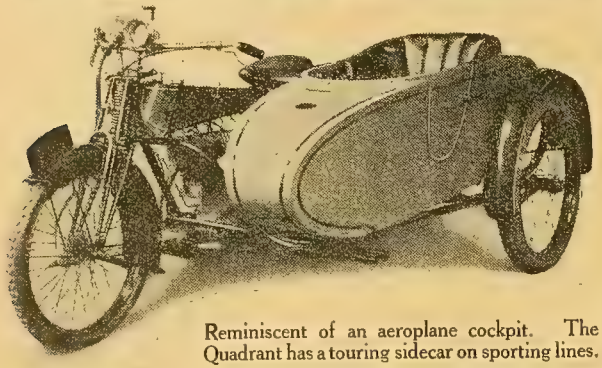
The Martinsyde de luxe model.

Sidecar Progress.—

provided to take up heavy road shocks without any possibility of bumping. The upholstery and bodywork generally, although not provided with any fancy fittings, are extremely comfortable and of very high quality.

QUADRANT.

QUADRANT MOTOR CYCLES, Lawley Street, Birmingham.—Quadrant machines are in many cases provided with sidecars of proprietary makes, but the Quadrant makers themselves also provide a sidecar of moderate price. The chassis is devoid of any startling innovations, but is a very sound piece of work. Extra care has been taken in the support for the mudguard, the longitudinal member of the sidecar chassis being extended behind the axle and bent up to reach the mudguard, to which it is solidly fixed. Another short tube is taken directly from the chassis frame and supports the front of the guard; the usual stays from the axle are also provided. The body itself, while not being extremely luxurious, is comfortable; and it is notable for the height of the back, which affords splendid support for the shoulders of the passenger.



Reminiscent of an aeroplane cockpit. The Quadrant has a touring sidecar on sporting lines.

RALEIGH.

RALEIGH CYCLE CO., LTD., Lenton, Nottingham.—Another example of a sidecar chassis specially designed to fit a spring frame machine, the Raleigh, had to face the additional difficulty that the machine to which it was to be fitted is exceedingly fast and powerful. The two main members of the frame are inclined towards one another at the front, in the form of a truncated triangle; the support from the saddle pillar is inclined backwards, and runs right through to the wheel axle. Four points of suspension are to the saddle-pillar, the bottom bracket, the footrest, and the steering head. It is satisfactory to note that extra width has been provided in the seat itself, a matter which should receive more attention than is often the case.

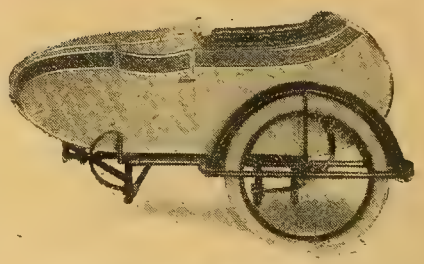
REX.

REX MOTOR MANUFACTURING CO., LTD., Earlsdon, Coventry.—The Rex exhibit is chiefly notable for the large two-seater saloon sidecar. The chassis of this is very interesting, being almost entirely made from steel pressings, more on motor car lines than after the usual style of sidecar construction. It is suspended from the motor cycle frame at four points; but, as double struts are taken to two of these points, it is really a six-point suspension. The body itself has a fixed top with detachable celluloid windows, and the seats are arranged in staggered form, so as to allow ample seating width for two adults without making the body unduly wide.

There are certain points common both to this sidecar and to the other ones exhibited, especially as regards the springing. In all cases the body is sprung on two coil springs at the front and on two long cantilever springs at the rear. Also in every case a heavy strut is taken from the chain stay attachment along the motor cycle frame to the steering head point.

RIDEEZI.

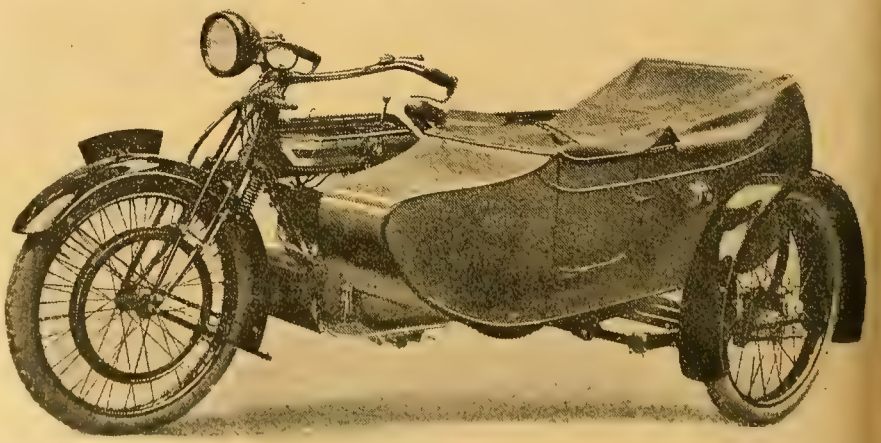
THE SIDECAR BODY CO., 25, Upper Clapton Road, E.5.—A number of highly-finished bodies to suit all tastes and requirements are produced. One of the most attractive is a double-seated sidecar, which, despite its provision for two passengers, is not cumbersome in appearance. This effect is achieved by extending the body backwards behind the front seat in the form of a long bulbous compartment, the lid of which, when raised, forms the back of the additional seat. The chassis on which this body is carried is of particularly robust construction, having duplex longitudinal members on the side nearest the machine. The wheel axle is supported at both ends, being surrounded by a continuous tubular framework. In addition to this particular model, there are several varieties of standard touring mediumweight and light machines. Another very interesting development in sidecar construction is the Roy body, which is manufactured by Messrs. Roy, Tripp, Strawford, and Co., of Bristol, and for whom the Sidecar Body Co. act as sole concessionnaires. The special feature of this sidecar is the method of providing weather protection for the passenger by means of a sheet metal hood, which follows the lines of the body itself. This hood, with its side shields, is pivoted at a point a little distance behind the hinged dash, and when it is out of use it is unnoticeable, since its shape is exactly the same as that of the body. The hood can be raised by the passenger until, at the top, it meets the upper frame of the windscreen, to which it is clipped. This converts the body into one of the completely enclosed variety on much the same lines as a *coupé*. Special provision is made for eliminating rattle in the metal hood by means of small rubber rollers mounted on its edge, which bear against the side panels of the body itself. This prevents any objectionable vibrations. The finish is decidedly handsome, being carried out in rich purple with black edgings and white lining.



A production of the Sidecar Body Co., notable for its clean lines.

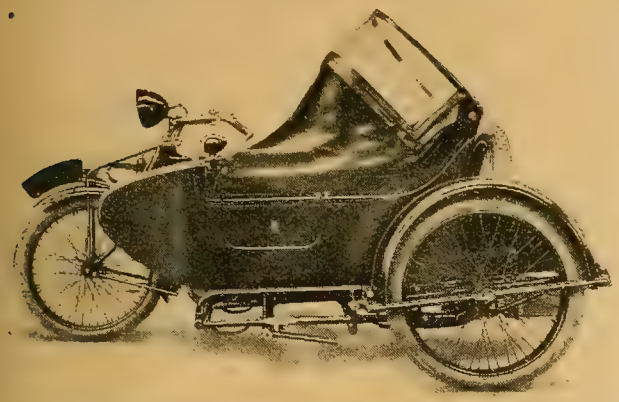
ROVER.

NEW ROVER CYCLE CO., LTD., Coventry.—Only minor improvements have been made in the Rover sidecar. Already well known, and having stood the test of many years' work, practically the only alteration is the dropping of the frame to allow for a larger body. As before, the main rear cross piece, supported from the chain stay, has a distinct slant backwards towards the outer end, and all that portion which forms part of the main sidecar chassis is made of a double tube. Three-point suspension has been retained, and is found completely satisfactory. The body itself is alike longer, wider, and deeper, and has at the rear sufficient locker room for a tin of petrol as well as other stores. The C springs for front and rear, on each side, are in one piece. Mudguarding is on very efficient lines without detracting from the handsome appearance of the complete outfit.



Ample bearings for the sidecar wheel and efficient mudguarding are noticeable features of the Rover sidecar.

Sidecar Progress.—



An Easting windscreen and sidecar stand are two refinements on this elaborate Royal Ruby sidecar.

ROYAL ENFIELD.

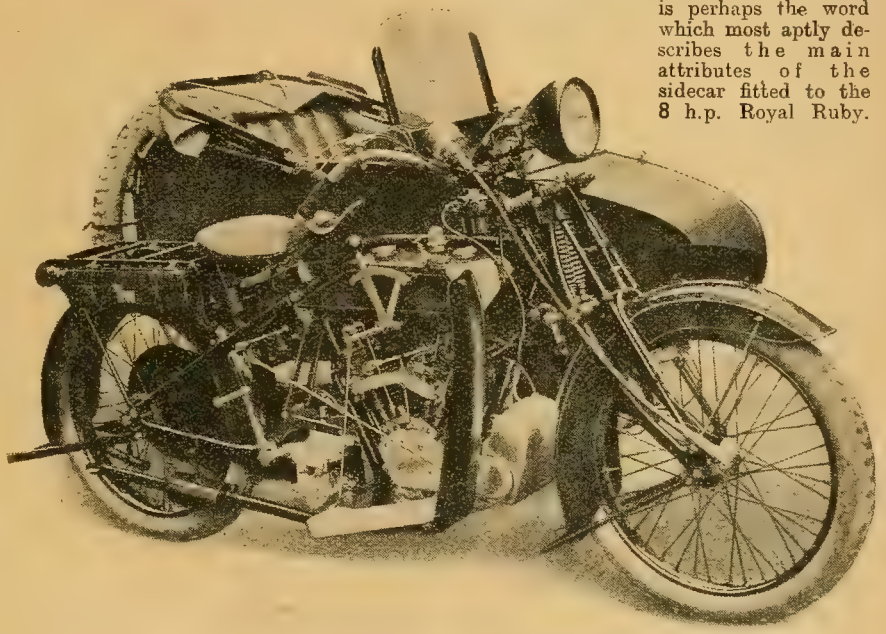
ENFIELD CYCLE CO., LTD., Redditch.—Although the Enfield outfit is offered at such an extremely moderate price, the chassis and body follow the Enfield company's standard practice as to quality and comfort. The chassis, which is specially built to suit the Enfield motor cycle frame, is of a very light and simple type, but it is notable for the heavy tie-bar which is taken from the chain stay attachment right along the motor cycle to the steering head sidecar support. The sidecar wheel mudguard is fixed on the body, and between it and the body itself a handy locker is provided. A well-designed folding luggage grid is fitted, and the body is extremely comfortable. It might, however, be made rather larger with advantage. A two-seater body may be obtained at small extra cost.

ROYAL LEICESTER.

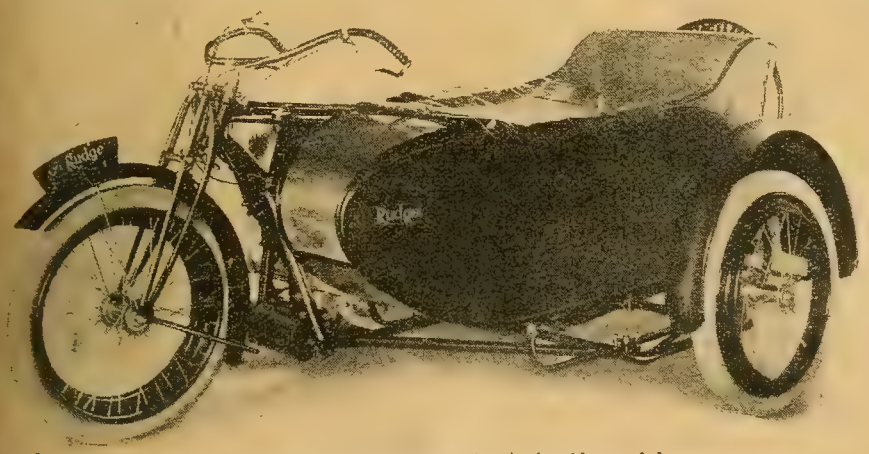
THE WILLOWBROOK CO., Leicester.—Six varieties of Royal Leicester sidecars are being manufactured, and these cover a full range, from the light sporting models to the fully equipped touring machine. Dealing with the former, the racer may be specially mentioned for its neat lines. It is constructed of polished aluminium, with beadings of the same material, and the front portion tapers sharply to a point. It may be had with or without side door, and a small locker is provided behind the high back-rest. The chassis of this model is of conventional pattern, with a straight back axle, only the front cross member being underslung. As opposed to this, we may turn to the full touring model. The chassis is fully underslung, and the body is carried on laminated C springs. It is specially noticeable for the high back—a feature often in great demand, and sometimes neglected. The construction is not unduly heavy, and the body itself is sufficiently roomy without being exceptional in size. It is fully equipped with hood, a side curtain, and a windscreen mounted on the hinged dash. Midway between these models is a light coachbuilt sidecar with underslung axle. The body is carried at the rear on C springs, with two coil springs at the front. It is a model well suited for use with medium-powered machines. A new model introduced for 1921 has coil springing for the body, which is supported on a system of cantilevers, the controlling springs being enclosed in telescopic sheaths. The front cross bearer bar is suspended upon two coil springs, which are also enclosed in telescopic sheaths. All the springs are adjustable. The mudguard is carried on the body, and an aluminium step is attached to the side member of the chassis.

ROYAL RUBY.

THE ROYAL RUBY CYCLE CO., LTD., Royal Ruby Works, Altrincham.—Solidity is perhaps the word which most aptly describes the main attributes of the sidecar fitted to the 8 h.p. Royal Ruby.



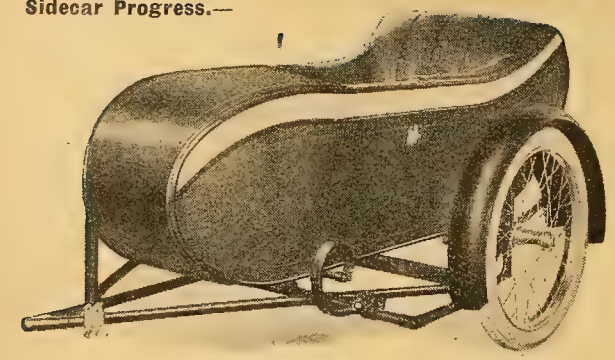
With a moderate selling price, the Martinsyde outfit is unusually distinctive and refined.



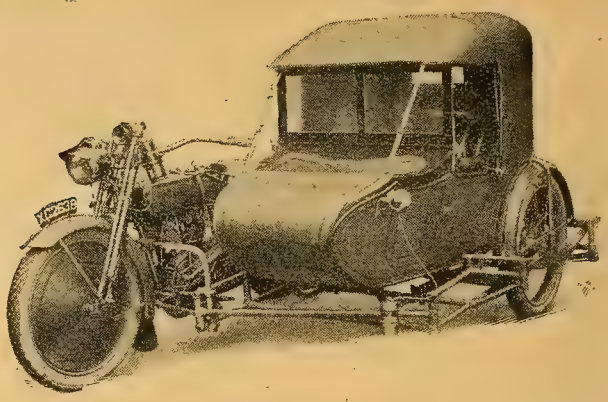
In keeping with the imposing build of the machine is the sidecar of the new countershaft Rudge. Features are the mudguard mounted on the body, and an aluminium panel on the nose.

The wheel is sprung on a short leaf spring more or less similar to those used for springing the cycle frame. The chassis to which the wheel is attached through this spring is of very robust construction; practically all the members are duplicated. The luggage grid, which also carries a spare petrol tin, is built of the same heavy tubes, and is not an afterthought, but is built integral with the chassis itself. The spare wheel is carried behind the body. The sidecar as a whole is supported from four points of the bicycle, but one of these supports is double, making five supports in all. A pivoted fork carries the wheel axle, and the shackle at the end of the spring is secured to an extension of the axle. Side roll of the wheel is prevented by guiding the shackle in a special housing at the rear extremity of the chassis. The body is large and exceedingly wide, and by means of a simple arrangement it can be removed from the chassis by the withdrawal of four accessible nuts.

Sidecar Progress.—



A light touring body on the Dunhill triangulated chassis.



A roomy Sandum taxi sidecar attached to a Harley-Davidson machine.

RUDGE.

RUDGE-WHITWORTH, LTD., Coventry.—Two types of sidecar are now offered by the makers of the Rudge. The smaller one is chiefly remarkable for the extreme lightness and simplicity of the chassis, which consists simply of a rear axle, a longitudinal member on the motor cycle side, and a diagonal member from the front of the latter to the stub axle carrying the sidecar wheel. The attachments are at the chain stay, saddle-pillar, steering head, and also on the end of a specially strengthened footrest.

In the heavier type, the chassis takes the form of a rectangle with an extended side and a diagonal member forming a triangle in front of the main chassis.

A large luggage grid has been provided, and the excellent expedient has been retained of suspending it from long angle-iron runners, which are attached to the body and not to the chassis, so that the luggage grid itself is sprung.

SANDUM.
